After Pearl Harbor, and the war declarations, came the third emergency conference of the Ministers of Foreign Affairs of the American Republics, at Rio de Janeiro. The resulting Rio Charter immediately became the blueprint for all inter-American activity, because it committed the 21 American Republics to a program of vigorous cooperation in military affairs, control of subversive activities and Axis propaganda, health and sanitation, transportation, communications, education, and general economic development.

The 1945 operations of the Office of Inter-American Affairs fell into two broad categories—economic development, with attendant health, sanitation, and food programs, and informational activities. The Rio Charter visualized the well-being of the peoples of this hemisphere as a fundamental goal and this is the chief concern of the basic economy program of the Office.

With its inception in 1940 the Office was responsible for numerous pioneering operations by the U. S. Government. In 1940, before Pearl Harbor, it set up a foreign information service—the first established by a United States government agency. Other pioneering operations included: (1) Publication of the first United States government foreign language magazine *En Guardia*, which was published in Spanish, Portuguese and French, and through 1945 had reached a circulation of 550,000 based on requests alone; (2) Working with the State Department the Office of Inter-American Affairs became the parent of the first cooperative international health and sanitation, food supply, education, and transportation agreements. These action programs, operated jointly by the United States and each of the other republics involved, created a new pattern for execution of international agreements. Throughout the hemisphere the pattern became known as the "servicio system," whereby United States technical missions to the other republics execute agreements for elevation of basic standards in the above mentioned fields under joint authority and financial commitments of the United States and each of the other 18 republics.

Still other firsts in implementation of foreign policy established by the Office were as follows:

- (1) Development of the most complete pictorial record of Central and South America in existence. This photographic library is at the disposal of all newspapers and magazines of the United States and the other American republics.
- (2) First use of the comic book technique, with its mass popularity, to disseminate the United States message to foreign countries.
- (3) Interchange of journalists between the United States and foreign countries.
- (4) Development of the first practical plastic plate for use in mass distribution of text and illustrated material.
- (5) Development of an information service completely processed, translated and ready to print, and supplied directly to newspapers in foreign countries.
- (6) Initiation of direct wire services to short-wave broadcasting stations for transmission of official translations of speeches, statements and other official documents.
- (7) Initiation of a program of cooperation with advertisers both in the United States and Latin America to include special inter-American material in their radio programs.
- (8) Broadcasting of short-wave English-language programs made up in part of domestic networks shows, with the commercials eliminated.
- (9) Installation of the first complete foreign distribution system for documentary and non-theatrical films.
- (10) Creation of the Motion Picture Society for the Americas, first organization of its kind, set up by the motion picture industry to elicit the cooperation of producers and distributors in the government's foreign motion picture program.
- (11) Enlistment of the cooperation of United States citizens resident abroad by organizing so-called Coordination Committees in all capitals of Latin America and in approximately 70 regional centers.

(12) Initiation in 1940 of the first voluntary program among United States business firms to replace agents and sales outlets identified with Axis activities in the other American republics. This program eventually became the Proclaimed List of Certain Blocked Nationals, or the Black List.

In 1940 and early 1941 the Office initiated a program for purchase of urgently needed strategic materials from Latin America. It started a program of industrial trade scholarships under which young men from Latin America were given one to two years training and practical experience in United States factories. In cooperation with the Ministry of Health of Mexico, the Institute of Inter-American Affairs, an agency of the Office, inspired the First Inter-American Conference on Typhus Fever—Mexico City, October 7-13, 1945. Correlating information and experience gained in the wartime development and use of anti-typhus vaccine and DDT in war theaters and several of the American republics, the Conference concluded that typhus could be controlled in the western hemisphere. Through the Institute of Inter-American Affairs and the Pan American Sanitary Bureau the Conference put in motion machinery to aid the other republics in effecting this control.

Supplementing the regular commercial services in their specialized fields, the Office of Inter-American Affairs during 1945 gave wide distribution to news of Inter-American significance, to articles, news pictures, posters, display placards and pamphlets. Pamphlets were published in Spanish, Portuguese, and English on a wide variety of significant hemisphere subjects. An illustrated booklet series on the other American Republics achieved a wide reader interest throughout the United States.

In radio the coverage was equally complete. Besides news broadcasts, for which a special inter-American news service was provided by the Office of Inter-American Affairs on a 24-hour, seven days a week basis, programs included special events, special anniversary programs, interviews with visitors from other countries, and dramatic programs. Many of these were rebroadcast over local stations in the other American Republics. United States networks and stations cooperated with the Office in broadcasting programs which have given United States listeners a better understanding of their southern neighbors. The net result of the program was a continual interchange of information by radio between the people of the United States and the radio audience in the other American Republics.

Motion pictures were widely used to carry the message of hemisphere solidarity to millions throughout the Americas. Distribution was made through regular commercial channels, as well as through private organizations, schools, clubs, and churches. Newsreels in Spanish and Portuguese were released weekly. The program of production and distribution of 16 mm. non-theatrical films, mostly educational and documentary in nature, was greatly furthered during 1945. Subjects included war production, resources and culture of the United States, health programs, agriculture, transportation, industry, and postwar topics. For distribution in the United States, film subjects included materials on the history, customs, resources, and activities of the other republics.

To further the growing mutual understanding among the peoples of the hemisphere, a total to date of 107 leading newspaper publishers, editors and writers from the twenty other American Republics have made extensive tours of the United States at the invitation of the National Press Club

in cooperation with the Office of Inter-American Affairs. These journalists made conducted circle tours of the United States, personally inspecting United States war activities, military camps, cities and agricultural regions, medical centers, libraries and educational institutions. They also had many opportunities to interview governmental, industrial and professional leaders.

In 1944-45, twenty journalists from 14 of the other American Republics were brought to the United States to take courses in advanced journalism at United States universities. In numbers ranging from one to five they attended classes at Harvard, Minnesota, Northwestern, Missouri, Texas, and Rutgers. For the 1945-46 scholastic year fourteen journalists from the other Americas were enrolled.

By Executive Order of August 31, 1945, the informational activities of the Office of Inter-American Affairs were transferred to the Department of State where they became part of the permanent Office of International Information and Cultural Affairs. The transfer included press, radio and motion picture divisions of the Office of Inter-American Affairs.

Other activities of the Office of Inter-American Affairs continued throughout 1945 under the Institute of Inter-American Affairs (health and sanitation, and food supply agreements), the Educational Foundation, and the Transportation Division. The Office of Inter-American Affairs continued direction of fulfillment of these agreements as parent organization to the corporations.

The health and sanitation work, developed jointly with governments of the 18 participating republics, continued during 1945 to include disease-control—particularly malaria—drinking water and sewage disposal projects, and educational programs for training nurses, health and sanitation specialists. Emphasis in this work was directed toward preventive medicine and environmental sanitation as contrasted with isolated curative measures. Institute of Inter-American Affairs personnel records for 1945 show that in carrying out its 800 assorted health and sanitation projects, 250 United States doctors, sanitary engineers and nurses (many of them detailed by the United States Army) worked in the field with 347 doctors, 148 engineers, 126 registered nurses, 2,919 technical and clerical personnel, 1,149 practical nurses and sanitary inspectors, and about 8,000 workmen of the other republics.

Another phase of health and sanitation work receiving continued attention during 1945 was scholarship training of health and sanitation technicians of the other republics in the United States. At the close of the year 395 of these had been given special public health courses and returned to take up program duties in their respective countries, or were in training in the United States. The contemplated figure for the over-all total of trainees to receive this training through the 1948 agreements period is 521.

During 1945 the Food Supply Division of the Institute of Inter-American Affairs serviced cooperative food missions in eight of the other American Republics—Brazil, Costa Rica, Haiti, Honduras, Panama, Paraguay, Peru, Venezuela. The big Brazilian cooperative operation was terminated in August. It reverted to operation by the Brazilian Government after having eased the wartime need for food in the "bulge" area and the Amazon basin. In these areas migratory rubber workers and United States as well as Brazilian armed forces faced hunger because of submarine

disruption of food supply from southern Brazil. The cooperative mission established fruit, vegetable, hog and poultry farms, distributed seed for staple crops, initiated better transportation, marketing, and storage facilities. By the summer of 1945 it was able to announce that food self-sufficiency for the area was within view.

The cooperative food program in Honduras also terminated in August, 1945, leaving that Central American Republic with three modern farm demonstration and experimental stations to serve as groundwork for long range elevation of the national food standards. Food production agreements with the other above mentioned republics extend through December 1946.

In the training phases of its cooperative work in the other republics the Food Division of the Institute of Inter-American Affairs adopted the technique of "learning by doing." Thus 86 young agricultural and nutritional technicians of the participating republics were trained or are in training in actual farm work on United States farms, with county agents, or in farm extension services. Other hundreds have been trained or are in training in their own countries for eventual work in long range programs for raising their national farm standards.

The primary purpose of economic development activities in the Office is to promote commercial relations and to assist in the maintenance of the basic economic stability of the Western Hemisphere. The initiation of the blacklist of Axis business representatives, promotional work to increase the production of strategic materials, assistance in the elimination of Axis interest in hemisphere airlines, are representative past accomplishments.

An important part of the economic development work of the Office was cooperation with United States businessmen in maintaining newspaper, magazine, and radio advertising in the other Americas during the war emergency. The normal advertising income of these communication agencies was necessarily curtailed by industrial conversion to war production in the United States and the curtailment of civilian exports.

During 1943, the Inter-American Educational Foundation was organized by the Office to develop a comprehensive cooperative educational program with the other American Republics. This program was directed at elementary and secondary school levels, teacher training institutions, and the reduction of adult illiteracy. The basis of cooperation is through the ministries of education and existing educational organizations. Reciprocal agreements call for joint contributions of funds, materials, and educational personnel. Development of inter-American teaching materials, construction of curricula, vocational, agricultural, and health education, and the training of teachers in Western Hemisphere languages, are fundamental to the program. The continuing increase in the study of Spanish and Portuguese in the United States during 1945 was equalled by the interest in the other Americas in the study of English.

United States educational activities of the Office included inter-American demonstration centers in the United States, consultant services to teachers and schools, the preparation and distribution of teaching aids, inter-American institutes and lecture series on inter-American affairs in colleges and universities, a national discussion contest on inter-American topics, inter-American workshops in summer schools and development of inter-American materials to supplement textbooks. This work was terminated in 1945.

Closely related to educational work was the coordination of activities carried on by various inter-American groups and organizations in the United States. The major function of this program was to encourage the active participation of community groups and organizations in affairs of inter-American import and significance, and to make available to such groups and to interested individuals informational materials—pamphlets, motion pictures, graphic materials, and exhibits.

The Office has furnished the services of United States transportation specialists to advise other American Republics on maintenance and operational methods. This work has been carried on in collaboration with other U. S. Government agencies. The most extensive program undertaken by the Department has been the sending of a United States Railway Mission to Mexico to assist in the rehabilitation of certain key lines of the National Railways of Mexico. Other railway missions have been sent to Bolivia, Ecuador and Colombia to counsel and advise on railway matters. Highway transportation advice also has been given by specialists to Mexico, Central America, Peru, Colombia, Ecuador, Venezuela and Paraguay. Advice on aviation matters and assistance in procuring aviation equipment has been given other American Republics by aviation specialists. During 1945 a consultant in Port Management conferred with seaport officials and inspected seaports in Mexico, Colombia, Venezuela, Peru and Brazil with the view of relieving port congestion with the resumption of peacetime trade. The visit to the United States of a number of highway and railway officials from the other Americas was sponsored by the Office during 1945 in collaboration with other governmental agencies and trade associations. Technical help was also given on matters relating to economic development and advertising.

WALLACE K. HARRISON.

INTER-AMERICAN DEFENSE BOARD. An autonomous, permanent organization under the auspices of the Pan American Union (q.v.) established in accordance with Resolution 39 of the Meeting of Foreign Ministers of Rio de Janeiro in January, 1942. It is composed of military, naval, and aviation technical delegates appointed by each of the governments of the 21 American Republics to study and to recommend to their governments the measures necessary for the defense of the western hemisphere. Maj. Gen. Edmund W. Hill is Coordinator; Col. L. S. Hitchcock is Secretary General.

INTERIOR, U.S. Department of. A Department of the U.S. Government, created in 1849 and charged with the responsibility for advancing the domestic interests of the people of the United States. In 1945 it consisted of the following principal branches (qq.v.):

- General Land Office
- Bureau of Reclamation
- Geological Survey
- Grazing Service
- Bureau of Mines
- Office of Indian Affairs
- National Park Service (see NATIONAL PARKS)
- Fish and Wildlife Service
- Office of Fishery Coordination
- Petroleum Conservation Division
- Solid Fuels Administration for War
- Coal Mines Administration
- War Relocation Authority
- Division of Power
- Division of Territories and Island Possessions
- Puerto Rico Reconstruction Administration
- Office of Land Utilization
- Office of the Solicitor
- Office of the Chief Clerk

Division of Information
 U.S. Board on Geographical Names
 Budget and Administrative Management Division
 Bonneville Power Administration
 Southwestern Power Administration
 Division of Personnel Supervision and Management

Secretary of the Interior in 1945: Harold L. Ickes; Under Secretary, Abe Fortas.

INTERNAL REVENUE, Bureau of. A division of the U.S. Department of the Treasury, created in 1862, which supervises the determination, assessment, and collection of all internal revenue taxes and enforces the internal revenue laws. In addition it is charged with the stabilization of all salaries in excess of \$5,000 as well as salaries under \$5,000 of executive, administrative, and professional employees not represented by a recognized labor organization. Major divisions are the Income Tax Unit, the Alcohol Tax Unit, the Miscellaneous Tax Unit, the Accounts and Collections Unit, and the Field Service. Commissioner: Joseph D. Nunan, Jr.

INTERNATIONAL COMMISSIONS. The following Commissions were related organizations of the U.S. Department of State in 1945.

International Boundary Commission—United States, Alaska, and Canada, created under treaties of 1906, 1908, and 1925 to define, mark, and maintain the boundary between the United States and Canada and between Alaska and Canada.

International Boundary Commission—United States and Mexico, organized under the treaty of 1889.

International Fisheries Commission—United States and Canada, established in 1923, which investigated and now regulates the halibut fishery.

International Joint Commission—United States and Canada, created in 1909 with jurisdiction over the boundary waters between the United States and Canada. See also **ANGLO-AMERICAN CARIBBEAN COMMISSION.**

INTERNATIONAL COURT OF JUSTICE. At the conference which met in San Francisco from April 25 to June 26 to draw up a charter for the United Nations, it was decided to establish an International Court of Justice. The new Court is intended to become the principal judicial organ of the United Nations Organization. It is expected therefore to supplant the Permanent Court of International Justice and will be established at the Hague, in the Netherlands.

The Permanent Court of International Justice was founded after the First World War. Article XIV of the Covenant of the League of Nations made provision for it. Its Statute was agreed upon in 1920 and the Court was established with headquarters at the Hague, where for eighteen years, from January 1922 to its last sitting in February 1940, it was in continuous and effective existence. At one time or another fifty-one states signed one or more of the many treaties which gave the Court jurisdiction. During its forty-eight sessions, the Court heard sixty-five cases. Some of these cases were withdrawn before final settlement, and two were still pending in 1945. In all, it rendered thirty-two judgments and twenty-seven advisory opinions, and issued more than two-hundred orders of one sort or another. Its authority was never seriously questioned and no government ever refused to comply with a decision which the Court had made.

The German armies invaded the Netherlands in May 1940, and the Court could not go on. The president and registrar moved to Switzerland; the

judges remained on call. Since 1940, one judge has died, and three have withdrawn, but the remaining eleven judges legally constitute the Court. It will continue this suspended life until the states that originally set it up decide officially to bring it to an end.

Preparations for a new world organization were begun before the Second World War ended, and it was evident from the beginning of discussions about the future that a world court of some kind would be an important part of whatever system of international order was established. Cordell Hull, American Secretary of State, said on July 23, 1942, "The settlement of disputes by peaceful means, and indeed all processes of international co-operation, presuppose respect for law and obligations. It is plain that one of the institutions which must be established and be given vitality is an international court of justice." Six days later, the British Secretary of State for Foreign Affairs observed, "His Majesty's Government are entirely in favor of the establishment, or re-establishment, after the war, of an international court of justice." In September 1943, Mr. Hull further remarked that "disputes of a legal character which present a threat to the peace of the world should be adjudicated by an international court of justice whose decisions would be based upon application of principles of law." And he said that attention was being given to "the extent to which the existing court of international justice may or may not need to be remodelled."

The proposals made by the preparatory conference on world organization, which met at Dumbarton Oaks in August and September 1944, called for the creation of an international court of justice that would be the judicial organ of the new world organization. The Dumbarton Oaks plan was for the new court's statute, or constitution, to be made an integral part of the new Charter, and for all members of the United Nations Organization to be members of the court as well. Whether the Permanent Court of International Justice was to be remodelled and continued in existence, or an entirely new court established, was a question left to the future.

On March 24, 1945, the United States issued on behalf of itself and the governments of Great Britain, Russia, China, and France an invitation to the United Nations to be represented on a Committee of Jurists which would make recommendations concerning the nature of a new court. The Committee of Jurists met in Washington, D. C. from April 9 to 20. The American representative, Green H. Hackworth, legal advisor to the State Department, was elected chairman. The jurists agreed upon a draft Statute for the new Court which they recommended to the United Nations Conference shortly to meet in San Francisco. The Court which they proposed was almost a duplicate of the Permanent Court of International Justice, and, in fact, they favored the continuation of the old Court with only a few changes. However, they left the final decision in this respect to the delegates at San Francisco.

In Chapter XIV of the United Nations Charter, which was drawn up at San Francisco between April 25 and June 26, the International Court of Justice is declared to be "the principal judicial organ of the United Nations." This chapter of the Charter states that all members of the United Nations Organization are to be automatically members of the Court, and that they agree to comply with the Court's decisions. In case one party to a dispute refuses to comply, the Charter provides

that the other party may appeal to the Security Council. The Statute of the new Court is appended to the Charter. Except for a few significant changes, the International Court of Justice is like the Permanent Court of International Justice which it is intended to replace.

Preparatory discussions leading to the establishment of the Court considered whether the Permanent Court of International Justice should not be retained and simply revised. A majority of jurists and lawyers favored retention. The American and Canadian Bar Associations jointly proposed this procedure, April 4, 1945, and the Committee of Jurists which met in Washington were of the same opinion. The lawyers and judges felt that it was important to preserve the continuity of personnel, tradition and records of a court which had functioned so well in the past. They felt it was important also to keep intact the many treaties which gave jurisdiction to the Court.

The decision at San Francisco, however, was to create a new body entirely. The reasons for this were mainly political. The old Court was attached, in a way, to the defunct League of Nations, and it was felt that it might lack prestige. Moreover, some of the states represented at San Francisco, notably the United States and the Union of Soviet Socialist Republics were not members of the first World Court, and they could not take part in any move to change an institution to which they did not belong. Moreover, of the fifty-one states who were members of the old Court, three no longer existed, and fifteen others were not represented at San Francisco. The old Court could not be changed legally without the consent of the absent fifteen states. It was best to start over again.

Nevertheless, the Statute of the new Court is substantially the same as that drawn up in 1920 and revised in 1929. The rules have not been changed. Even the numbering of the articles has not been altered. Of the sixty-eight articles of the old Statute, fifty are almost exactly the same, and the only real innovation consists in two new articles providing for the Statute's amendment. Consequently, the new Court will not differ either in composition, jurisdiction, or procedure from the old one. The extent to which the International Court of Justice is considered to be the legal successor of the old Court is indicated by the provision enabling states to transfer automatically to the new Court the jurisdiction conferred upon the old Court by the numerous treaties they had signed.

As was anticipated in the Dumbarton Oaks Agreements, the new Court is to be an integral part of the United Nations Organization. This relationship is unlike that between the old Court and the League of Nations. All states who are members of the United Nations Organization are expected to be members of the new World Court, including the United States and the Union of Soviet Socialist Republics. States which are not members of the United Nations Organization may also become parties to the Statute of the New Court on conditions laid down by the General Assembly. Or they may use the Court for a particular case on conditions laid down by the Security Council.

The new World Court, being a law court, or a place of legal settlement, is restricted in scope and its activities cannot be spectacular. It will operate within the limits of the judicial process, and it will handle only judicial, or juridical disputes. Disputes of international scope which are judicial in nature were defined in the Covenant of the League of Nations and in Article 36 of the new

Court's Statute. They are those which involve: (1) the interpretation of a treaty; (2) any question of international law; (3) the existence of a fact which, if established, would constitute a breach of an international obligation; and (4) the nature or extent of any reparation to be made for a breach of an international obligation. Such disputes do not frequently make the headlines, but they cover the field of legal action, and, so long as states will live within the law, the new Court can supply solutions that will end controversies which may arise.

The principles of the judicial process are generally agreed upon. The Court will offer full opportunity for each party to present its case. Trained, impartial judges will weigh carefully all views presented to them. They will make their decisions on the basis of international law. Such law—according to Article 38 of the Statute—they will find embodied in treaties, customs, generally accepted principles, in judicial decisions, and in the teachings of great jurists. In situations where states go outside the law, other agencies, like the Security Council or the General Assembly, manned by statesmen and diplomats, will be needed to settle disputes.

The Court, however, may not take the initiative or act of its own volition. The parties to the dispute must authorize the Court to act. No individuals, only the governments of sovereign states, may bring in the cases. Many jurists, and the majority of the delegations at San Francisco, do not regard this as an ideal situation. They feel that, since juridical disputes are of a highly specialized nature, it would not be too much to ask of all the states who are members of the United Nations Organization to agree in advance to give the New International Court the right to try all cases of a juridical nature to which they may become a party. Such agreement in advance is somewhat confusingly called giving the Court "compulsory jurisdiction." Largely because of the opposition of the United States delegation, which feared that the Senate would never give its consent to such a proposal, the Court was not given such compulsory jurisdiction in the Charter or in its Statute. Individual states may, however, give the Court such jurisdiction if they so desire, simply by agreeing to an "optional clause," referred to in Article 36 of the Statute. A similar clause, attached to the Statute of the old Court, was used by 45 of the 51 members of that body. This agreement to bring all legal disputes to the Court may be given for a limited number of years. It is possible also for a state to agree to the Court's jurisdiction in advance by including in treaties the provision that the Court shall have jurisdiction in any dispute arising over the treaty. The United States is party to one such treaty now, in the Constitution of the International Labor Organization.

In general, however, the United States, which led in developing the methods of arbitration and judicial settlement during the 19th century, now objects to making any court's jurisdiction automatic. The United States Government insists upon the Senate's right to give its consent in each case as it may arise. One the day on which the Senate ratified the United Nations Charter, Senator Morse of Oregon offered a resolution in the Senate that the United States accept in advance the jurisdiction of the new Court in all future juridical disputes. But the resolution was still in the hands of the Foreign Relations Committee of the Senate at the end of November.

As in the case of the old Court, the new one has

no authority to enforce its decisions. This is not regarded as a serious omission. It is not expected that the Court's judgments will be disregarded. But provision is made in the Charter that, should one party to a dispute refuse to honor the Court's decision, the other party may appeal to the Security Council, which has authority to propose the steps to be taken in such a case. The League Council had a similar role in connection with the old Court. But in all the cases which came before the old Court, the decisions were accepted and only once did the League Council even have to consider any action.

Like the old Court, the new one will consist of fifteen judges. They will ordinarily sit together in full court, but they may establish or create such smaller chambers as they need for special purposes. The judges are not to be regarded as national representatives. They will be eminent jurists, chosen for their ability and high moral character. Nevertheless, no two judges may be from the same state. Judges are to be nominated by national groups of jurists such as those belonging to the Permanent Court of Arbitration at the Hague, and they are to be elected for terms of nine years by a majority vote in both the General Assembly and the Security Council. This parallels the procedure followed for the election of judges to the old Court. One new procedure, however, is that this time the judges' terms will be staggered, and five judges will be elected every three years. The first fifteen judges elected will determine by lot which ones are to serve the full nine years, which six years, and which only three.

The International Court is empowered not only to render judgment in contentious cases brought before it, but it is authorized to give its advice. That is, it may render an "advisory opinion" on any legal question if it is asked to do so by either the General Assembly or the Security Council. This, also, is in keeping with the tradition established by the first World Court whose advisory opinions were considered valuable. Moreover, other agencies in the United Nations Organization may request an opinion of the Court, if they are authorized by the General Assembly to do so.

In the Statute of the first World Court, there was no provision made for any change or amendment. Consequently, changes had to be approved unanimously. The Statute of the new Court is a part of the United Nations Charter, and it is provided that it may be amended in the same way as the Charter, by a two-thirds vote of the General Assembly including all the permanent members of the Security Council.

Such, in brief, are the significant characteristics of the new International Court of Justice. The Senate of the United States ratified the Charter of the United Nations, with the Statute of the International Court of Justice annexed, on July 28. Thus membership of the United States in the new Court is assured. By October, other countries, China, France, Great Britain, and the Union of Soviet Socialist Republics as well, and a majority of the remaining states which had signed the Charter, had formally ratified the Charter and the Statute of the Court. This was a number sufficient to bring the United Nations Organization and the new Court into existence. The Court is expected to be formed and to enter upon its duties in 1946. By the end of 1945, nominations were already being made and two Americans were on the list. Judge Manley B. Hudson has been an American justice on the old Permanent Court and has had a long career of useful participation in the efforts of

modern nations to establish a rule of law for international affairs. His name was offered by the group of men who represent Ethiopia in the Permanent Court of Arbitration. Green H. Hackworth was the nominee of the American group of jurists.

It is expected that chief members of the Court will be chosen from among the jurists of the western nations since they dominate the Security Council in its present form. The framers of the Statute, however, were reaching out toward a possible future international situation in which all civilizations and all cultures, of all races and kinds of men everywhere, could find an ideal of justice which they could understand. To this end, the Statute provides in Chapter One, Article 9, "At every election, the electors shall bear in mind not only that the persons to be elected should individually possess the qualifications required, but also that in the body as a whole the representation of the main forms of civilization and the principal legal systems of the world should be assured."

LYMAN BRYSON.

INTERNATIONAL INFORMATION AND CULTURAL AFFAIRS, Office of (OIC). Government agency which was created Jan. 1, 1946, to continue the overseas information activities of the Office of War Information and of the Office of Inter-American Affairs. The agency, which functions within the Department of State, succeeded an interim international information service. The purpose of the OIC is described in a published letter from Secretary of State Byrnes to President Truman as that of presenting to the world "a full and fair picture of American life and of the aims and policies of the U.S. Government." American libraries of information are to be maintained abroad. Documentary films describing the U.S. are to be scored into foreign languages and sent overseas. A Russian-language magazine intended for distribution in the Soviet Union is to be continued, and short-wave broadcasting will proceed on a reduced scale until action has been taken to dispose of transmitters and frequencies now controlled by the Government. The exchange of students, scholars, and technicians with foreign countries will be continued on a larger scale; operating under the supervision of diplomatic missions, particularly in the case of Latin America; and small staffs will be maintained in 62 countries to direct informational and cultural relations. Mr. Byrnes adds that although the program is "modest compared to war-time standards," it is a "new departure for the United States" for which "a significant expansion in terms of personnel and budget" is planned. William R. Benton, Assistant Secretary of State, is in charge of public affairs for the agency, and the director is William Stone. Chief of the Informational Press and Publications Division is J. Noel Macy. John Ogilvie is head of the International Broadcasting Division.

INTERNATIONAL LABOR ORGANIZATION (ILO). An association of nations which seeks by international action to improve working conditions, raise the standard of living, and further economic and social stability. Its machinery consists of the International Labor Conference, the Governing Body of the International Labor Office, and the International Labor Office. The Conference, which meets at least annually, is composed of four delegates from each Member State: two Government representatives and a representative each from management and labor who are chosen by Governments in agreement with the most representative employers' and workers' organizations in their respective coun-

tries. The principal function of the Conference is to adopt Conventions and Recommendations which define minimum standards of social policy. Sixty-seven Conventions and 74 Recommendations have been adopted by the Conference.

The Governing Body is composed of thirty-two members, sixteen of whom represent Governments, eight of whom represent labor and eight of whom represent management. Eight of the Government seats are non-elective and are held by the states of chief industrial importance. The other eight are filled by Governments elected by the Government delegates to the Conference in an election in which the eight states of chief industrial importance do not participate. The labor and management representatives are elected by the labor and management groups at the Conference.

The International Labor Office acts as the secretariat to the Conference and Governing Body, publishes a series of periodicals, including the monthly *International Labour Review*, which appears in English, French and Spanish, undertakes research on problems of industrial safety, employment, social security, etc., and publishes the results of these studies and reports in several languages.

The working headquarters of the Office were transferred to Montreal in 1940. Three sessions of the International Labor Conference have been held since then. A special session took place in New York in 1941, the 26th regular session was held in Philadelphia in 1944, and the 27th in Paris in October and November, 1945. Regular meetings of the Governing Body were resumed in 1943.

The 27th session of the Conference adopted an Instrument for the Amendment of the Constitution of the Organization which, when ratified by the required number of member states, will free the Organization from its ties with the League of Nations and make possible the establishment of relationships between the Organization and the United Nations. The Conference set up a committee to examine and report on other proposed amendments to the Constitution preparatory to acting upon them at the next session of the Conference. It also adopted a resolution reaffirming the Organization's desire to associate itself with the United Nations.

Other actions of the Conference included the adoption of a Recommendation on Social Policy in Dependent Territories (Supplementary Provisions), a resolution recommending national and international policies designed to maintain high levels of employment during the period of rehabilitation and reconversion, and a resolution recommending policies for the protection of children and young workers. The Conference decided that its 29th regular session would be held in Montreal beginning Sept. 19, 1946. The 28th session will be held earlier in 1946, and will be devoted exclusively to the consideration of international minimum standards in the maritime industry.

During the Paris session of the Conference, a new Governing Body was elected for a three-year term. Governments elected were Australia, Brazil, Chile, Egypt, Mexico, Peru, Poland, and Sweden. The non-elective Government seats are held by the United States, Belgium, Canada, China, France, United Kingdom, India, and the Netherlands.

During 1945 the Governing Body held four sessions. In July the Permanent Committee of the Inter-American Conference on Social Security, with which the Organization works in concert, met in Mexico City. A Preparatory Technical Maritime Meeting to formulate proposals for submission to the 1946 Maritime Session of the Conference was held in November in Copenhagen. In December,

meetings were held in London of the Coal Mining and Inland Transport Committees, two of the seven International Tripartite Industrial Committees which are being set up as part of the Organization's structure by decision of the 1944 Conference. The Industrial Committees for Building, Civil Engineering, and Public Works; Iron and Steel Production; the Metal Trades; Petroleum Production and Refining; and Textiles will meet in 1946. During the year two sessions of the Correspondence Committee on Accident Prevention were held to prepare a draft model safety code for factories which will be submitted to a forthcoming session of the Conference.

During the year the International Labor Office continued to provide expert assistance to Governments in the drafting and administration of social legislation. Ratifications of International Labor Conventions registered during the year totalled eleven, bringing the total number of registered ratifications to 913.

The Directorate of the International Labor Office is: Acting Director: Edward J. Phelan (Ireland); Asst. Directors: Lindsay Rogers (United States); Jef Rens (Belgium); George A. Johnston (United Kingdom). ILO Branch offices: Washington, London, Paris, New Delhi, Chungking.

CAMPBELL BALLANTYNE.

INTERNATIONAL TRADE, Office of. The Office of International Trade, Department of Commerce, has been directed to develop programs to encourage and facilitate the expansion and balanced growth of international trade; promote stability of international economic relations; cooperate with other nations in solving of trade and exchange problems through international organizations and conferences; assist other nations toward higher economic development as a means of stimulating U.S. and world trade; foster and promote trade interests in exports, imports, and the maintenance of full employment; facilitate U.S. participation in peacetime trade with former enemy and other areas in which normal channels of trade do not exist; and resist obstacles to and restrictions upon international trade. The Office will represent the Department in connection with the proposed International Trade Organization and all other economic, financial and trade agencies and conferences in the international field.

The action of the Secretary of Commerce in establishing the Office merged those functions and personnel of the Foreign Economic Administration which were transferred to the Department of Commerce by Executive Order dated Sept. 27, 1945, with those of the Bureau of Foreign and Domestic Commerce which have been concerned with world trade. Under this action it is planned to continue and strengthen the services the BFDC has provided exporters and importers and to encourage expansion of U.S. trade with the rest of the world.

The new organization will have an Office of World Trade Policy; an Office of World Trade Promotion; an Office of War Areas Trade; and an Office of Foreign Economic Development to carry out its functions.

ARTHUR PAUL.

INTERSTATE COMMERCE COMMISSION (ICC). An independent establishment of the U.S. Government empowered to regulate, in the public interest, common carriers engaged in transportation in interstate commerce. (For details, see *YEAR BOOK* for 1940.) Part IV of the Interstate Commerce Act, approved May 16, 1942, conferred upon the Commission jur-

isdiction over freight forwarders. Many times during the war the Commission exercised emergency powers under which it directed that certain traffic have preference or priority in transportation. Chairman: John L. Rogers.

For studies of interstate trade, see also TRANSPORTATION INVESTIGATION AND RESEARCH.

IRAN (Persia). A kingdom in southwestern Asia. Area, approximately 628,000 square miles. Capital, Tehran.

Government. The reigning king, or Shah, is Mohammed Riza Pahlevi, who succeeded his father, Riza Khan Pahlevi in September, 1941, when the latter was forced to abdicate by concerted Anglo-Soviet action because of his unwillingness to take energetic measures against the Axis and its agents in his country. The Constitution provides for a national assembly, or Majlis, to which the Cabinet is responsible. The country is divided into numerous divisions and subdivisions, the administrators of which are responsible to the central government.

The budget estimates for 1944-45 showed a revenue of 10,325,000,000 rials and an expenditure of 10,324,000,000 rials. These figures include both the ordinary and the extraordinary budgets, the latter of which provides for the Government's various industrial and commercial enterprises. In recent years a number of American financial experts under Mr. Arthur C. Millspaugh have been serving the Persian Government. Mr. Millspaugh and his colleagues have now returned to the United States.

An American police mission under Colonel Norman Schwarzkopf of New Jersey has been reorganizing the country's police forces. The army, navy and air forces have also been undergoing reorganization. Since 1941 considerable areas of Iran's national territory have been occupied by British and Soviet, and more lately by American, troops. However, the country's territorial integrity, sovereignty and political independence were guaranteed by a treaty of alliance signed at Tehran by Great Britain, the U.S.S.R. and Iran on Jan. 29, 1942. This was confirmed by a Declaration made by Mr. Churchill, President Roosevelt and Marshal Stalin at the time of the Tehran Conference, Dec. 1, 1943).

Events, 1945. In January the opening of the Dardanelles and Bosphorus to Allied shipping made it possible to send English and American goods direct to Russian ports, thus obviating the laborious, roundabout route across Iran. The Persian Gulf Command was therefore liquidated (as of June 1) and many of the American troops in Iran were transferred to the China theatre of operations. On June 28 it was announced in Tehran that the British and Americans had returned their sections of the Trans-Iranian Railway to the Persian Government. By November 1 it was expected that only some 2,600 American troops would remain in the country to maintain and guard military installations. In all, the Allies had delivered over five and a half million tons of material to Russia via Iran, and of this 2,831,937 tons had gone over the railway. To provide the latter with adequate rolling stock, the United States had sent 180 locomotives and 5,175 freight cars. Much of this, as well as large numbers of trucks and other items, were sold to the Iranian Government.

The end of Persia's importance as a route to Russia caused the country's economy to pass rather suddenly from a wild inflationary spree into a period of deflation. The economic and social results, especially on the working classes and landless peasants, were soon evident in political agita-

tion. The Leftist Tudeh, or "Masses," Party gained many adherents and began making trouble for the Government. The Party's leaders favored friendly relations with Russia and it was widely believed to be Communist-directed. By mid-April armed clashes were taking place between its adherents and those of the "National Will" Party. The ministry, in office only six months, resigned on April 19. It was followed by one headed by Dr. Hakimi on May 11, who, however, resigned on June 4 after an adverse vote of the Majlis.

Meanwhile in May the Iranian Government asked the three occupying Powers to withdraw their troops now that the war in Europe was over. The United States agreed, but neither Britain nor Russia was willing to move without assurances of parallel action from the other. The Allies were reminded by Tehran that they had formally agreed to evacuate their forces within six months of the end of the war—that is, by March 2, 1946. At the same time, Iranian officials complained that the Russian military authorities in the Soviet-occupied zone in northwest Iran (Azerbaijan) had refused to permit the Iranian police to send troops into that area in order to quell disturbances said to have been provoked by the Tudeh Party. The Soviet press began to take more and more interest in Iranian domestic affairs, offering criticism of the Government and its conservative policies. By the end of September the Tehran Government openly expressed fear of Soviet aggression in the northern provinces and sought the diplomatic assistance of Britain and the United States to stop the Russians. The issue was raised at the Council of Foreign Ministers which met at London in September and early October. Foreign Secretary Bevin revealed on Oct. 10 that, in an exchange of letters between him and Foreign Commissar Molotov, it had been agreed that British and Russian troops would be withdrawn from Iran by March 2, 1946.

However, the Russians still refused to allow the Tehran Government to send police and troops to put down disorders in Azerbaijan and Kurdistan, where an independence movement was under way. On Oct. 22 the ministry resigned, and was replaced by one headed by Hakimi, who had held office briefly in the late spring. Meanwhile reports indicated that the Russians were sending more troops into their zone in northern Iran.

On Nov. 18 Tehran announced that a full-fledged revolt had broken out in Azerbaijan Province and that the insurgents were armed and encouraged by the Soviet authorities. The rebels were said to be marching on Tehran, but government troops sent to help quell them were turned back by Soviet forces at Kazvin. The Iranian Foreign Office again appealed for help from the United States and Britain, and it was plain that a first-class international crisis was brewing at a time when relations among the Big Three were already strained as a result of the miscarriage of the London Conference in October. The British in particular took a serious view inasmuch as their imperial interests would be gravely menaced by a Russian coup in Iran. It was generally taken for granted that Russia's actions indicated an extension to the Middle East of her Eastern European and Balkan policy of supporting "friendly regimes." The defense of the oil fields of the Caucasus and the acquisition of the oil resources of northern Iran, for which a Soviet concession had been refused in 1944, were also important contributing factors. Russia's policy in Iran obviously tied in with her encouragement of Armenian irredentism in the Kars and Ardahan districts of Turkey.

On Nov. 25 a "National Congress of Azerbaijan" demanded the creation of a democratic and autonomous government in the province. On the 26th the State Department in Washington announced that it had proposed, in a note to Moscow, the withdrawal of all Russian, British and American troops from Iran by Jan. 1, 1946. Meanwhile charges and countercharges flew back and forth between Moscow and Tehran. On Dec. 2 the Iranian Governor of Azerbaijan was reported assassinated by the autonomists. The next day the State Department announced that Russia had refused to withdraw from Iran by Jan. 1. The United States nonetheless hastened to recall its few remaining troops there. The British decided to stay. The internal situation in Azerbaijan continued to deteriorate, with rebel forces virtually immobilizing the troops and officials loyal to Tehran. On Dec. 9 a council of five elder statesmen was formed in Tehran to assist Prime Minister Hakimi with advice and counsel during the emergency.

By the middle of December it had become obvious that, if the impasse were to be broken, it would have to be done by the Tripartite Conference of Foreign Ministers then meeting in Moscow. With the aid of the Russians, the rebels in Azerbaijan Province, after obtaining the surrender of the government garrison in Tabriz, proclaimed a "national government" there on Dec. 16. Prime Minister Hakimi promised the Majlis that he would take strong measures to put down the insurrection. All this happened while the problem was being explored at Moscow, where Commissar Molotov sought to tie the question of Iran with that of Java and Greece. Russia was reported to hold that the only basis on which she would discuss Iran was as part of the whole Middle East complex of problems, including Arabia, Palestine, Armenia and the Straits. As a result there was no agreement at Moscow on Iran, and as the year closed evidence was piling up that, far from preparing to evacuate, the Soviet forces were actually expanding their hold in that country.

Characteristics of the People. Estimates of the country's population vary from less than 10,000,000 to over 15,000,000. From a quarter to a third of the inhabitants are still nomads, living largely under tribal organization. Most Persians are Moslems of the Shia sect, except for some 850,000 Sunnis. There are small communities of Parsees, Jews, Armenians, Nestorians, Bahaists and others. Persia has been the melting pot of invading peoples and races from time immemorial, and this is evident from the existence of various minorities within her borders: e.g. Armenians and other Caucasian peoples in the northwest, Kurds in the west, Turks in the northeast, etc.

The educational system of the country was drastically reformed during the modernizing era of Riza Pahlevi. In 1937 there were 4,939 schools, a figure which during recent years has undoubtedly grown considerably. A university has been set up at Tehran offering a wide curriculum of technical and liberal studies. In general, foreign schools have been absorbed into the national educational system or have been abandoned.

The Country and Its Economy. By and large Iran is a barren country abounding in vast deserts and steppes where only a sparse nomadic population can obtain sustenance. Yet much of its soil is fertile and only awaits irrigation. Despite these unfavorable conditions Iran is essentially an agricultural country producing a wide variety of grains, fruits and livestock. One of the factors holding back agricultural progress is the fact that two-

thirds of the land is in large estates. Under this feudal system small landowners constitute only a small minority of those tilling the land. The principal agricultural products are wheat, barley, Indian corn, rice, many varieties of fruit, tea, tobacco, cotton and silk. Cattle, horses, donkeys and camels are also bred extensively. Persia has long been a principal producer of the poppy from which opium is derived.

Industrialization has already begun in a small way with the production of such goods as textiles, carpets, glass and sugar. As a consequence there is arising an industrial proletariat in some of the larger cities.

Many of the mineral deposits have been only partly explored and are largely undeveloped. Oil is by far the most valuable mineral product now exploited in the country and the international competition for its control has kept Iran in intermittent danger of losing her independence for forty years. In southwestern Iran the Anglo-Iranian Oil Company has a large concession on which oil is produced, piped to refineries at Abadan on the Shatt-el-Arab and exported in large quantities. In 1941 Iran ranked fourth among the oil-producing countries of the world with an output of 6,708,000 metric tons. By 1944, under the impetus of war needs, the production of the Anglo-Iranian Oil Company had reached 11,521,555 tons. New refinery capacity, including facilities for producing high-octane aviation gasoline, had also been installed. The company employed 65,000 Iranians and Abadan had become a city of 120,000 inhabitants.

The two principal ports on the Persian Gulf are Khorramshahr and Bandarshapur. The main line of the Trans-Iranian Railway was completed in 1938 from Bandarshapur through Tehran to Bandarshah on the Caspian Sea, a distance of 865 miles. Though this was one of the engineering triumphs of the 20th century, some of it had to be rebuilt before it could be used to capacity for transporting Lend-Lease material to Russia during the recent war. Branch lines have been started towards Tabriz, Meshed and Yezd, but none of them is as yet completed. Southern Iran lies along the routes used by the principal airlines between Europe and India.

ROBERT GALE WOOLBERT.

IRAQ (Iraq). A kingdom occupying the lower and middle parts of the Tigris and Euphrates river basins, frequently referred to as Mesopotamia. Its area is 116,600 square miles. Capital, Baghdad.

Government. The reigning king is Faisal II, who succeeded to the throne after the death of his father, King Chazi, on April 4, 1939. During the King's minority, affairs are in the hands of a Regent, Emir Abdul Illah. The Class A Mandate, under which Iraq had been governed following the First World War, terminated in 1932 when the country achieved its juridical independence and became a member of the League of Nations. Iraq was the first of the mandated areas thus to acquire its freedom as promised in the Covenant of the League of Nations.

The Constitution provides for a limited monarchy and a responsible government. The legislature consists of a Senate of twenty elder statesmen nominated for eight-year terms, and a Lower House comprising 115 elected Deputies. For administrative purposes the country is divided into fourteen liwas. The army has been in process of reorganization since the revolt in which certain elements of it participated in 1941. The police force is under British technical supervision.

Events, 1945. The extent of the war-induced inflation in Iraq was indicated by a statement made on January 31 by the director of the Baghdad Chamber of Commerce, Meer S. Basri. According to Mr. Basri, the circulation of currency in the country had increased from 6,000,000 dinars before the war to 42,000,000 dinars at the end of 1944. During the same years Iraq also built up sterling credits in London believed to amount to some £60,000,000. In June it was learned that preliminary work had started on the construction of a sixteen-inch pipeline from Kirkuk to Haifa to supplement the line already running between those two points. The actual laying of the 620-mile route was scheduled to start in 1946, according to the announcement of the Iraq Petroleum Company. Flow of oil through the completed line was expected to begin in 1948, with an initial annual capacity of 23,000,000 bbl. of crude petroleum. In September it was reported that a new pipeline to Tripoli was also being planned which would greatly increase the capacity of the outlet through Syria.

In the autumn it was learned that Rashid Ali, leader of the 1941 revolt, had managed to escape from Europe to Saudi Arabia. The Iraq Government naturally wished to obtain custody of this traitor, who was under sentence of death, but the ancient Arab custom concerning the right of asylum made it difficult, if not impossible, for Ibn Saud to surrender him. On Oct. 16 Colonel Salahuddin Sabagh was executed in Baghdad—the last of the four military leaders of the 1941 revolt to be apprehended and put to death.

During the latter half of the year the situation in Kurdistan and along the Iraq-Iran frontier gave increasing cause for worry to the Baghdad authorities. The Kurdish rebel, Mulla Mustafa, was finally routed from his stronghold in northeastern Iraq, only to take refuge in Iran, where he was reported to be receiving encouragement from the Soviet authorities. As the year closed, the Iraq Government feared that the Soviet-inspired independence movements already making trouble in Persian Azerbaijan and Turkish Armenia might serve as models for similar uprisings in Iraq.

Iraq continued to pursue a policy of close solidarity with the other Arab countries in regard to such issues as Palestine and Syria, and she was active in the formation of the Arab League (see PAN ARAB AFFAIRS). Baghdad expressed disappointment that neither President Roosevelt nor Prime Minister Churchill had interviewed a representative from Iraq during their brief sojourn in Egypt after the Yalta Conference. During the late spring and summer Prince Abdul Illah, the Regent, visited the United States and Europe. On Aug. 28, while in Paris, he expressed opposition to President Truman's request that Palestine be opened to 100,000 Jewish refugees from Europe. On October 3 the Iraq Foreign Office released a protest which it had sent to Washington backing up the Regent's statement. In this note the United States was reminded that President Truman's suggestion violated Mr. Roosevelt's engagement not to settle the Palestine problem without consulting the Arabs.

Characteristics of the People. The estimated population in 1935 was 3,560,456. Over 3,000,000 of these were Moslems; 101,375 were Christian, including Orthodox, Catholics, Protestants and a few remaining Assyrians; and 90,970 were Jews. The official language spoken by the great majority of the people is Arabic. However, on the northern and eastern frontiers there are Kurdish and other

minorities which jealously preserve their cultural identities.

According to law primary education is free and compulsory, but the law is not enforced everywhere. Recent statistics show 788 elementary schools, 61 private primary schools, 63 intermediate schools, and 16 secondary schools. By far the great majority of these institutions are for boys, though the education of girls has been making marked progress in Iraq during recent years. There is no university, but there are colleges of engineering, medicine, pharmacy, teacher training and law, as well as technical schools of agriculture, nursing, etc.

The Country and Its Economy. Iraq is the land of the Biblical Garden of Eden. It has rich agricultural potentialities which could be realized by extensive irrigation and drainage works. At present about 10 percent of the area of Iraq is cultivated; 20 percent is potentially arable; 8 percent is mountainous; 5 percent consists of flooded areas, swamps and lakes; while 66 percent is desert or steppe country. In the north wheat and barley are important crops and sheep-herding is extensive. In the lower delta region some 80 percent of the world's total output of dates is grown.

The country's most valuable product is petroleum, which is produced at several places in northern Iraq. The principal oil field is at Kirkuk, which is connected by pipelines with the Mediterranean ports of Tripoli and Haifa. In 1942 oil production totaled 16,500,000 bbl. The Iraq Petroleum Company, which exploits the Kirkuk field, is controlled by an international group in which British, American and French interests have been represented.

In 1939 imports were valued at 8,156,179 dinars, and exports (exclusive of oil) at 3,759,401 dinars. Basrah, on the Shatt-el-Arab, is the country's principal port. At the beginning of the recent war the standard gage railway which had long been projected to connect Baghdad with Syria and Turkey—the old Berlin-to-Baghdad line—was finally completed. There is also a metre-gauge line from Basrah to Baghdad, and thence to Kirkuk and Khanakin. Highway communication with Iran is maintained from the latter point. Altogether there are nearly 1,000 miles of railway in the country. There are also over 1,200 miles of good highway, including the routes from Baghdad to Damascus and from Baghdad toward Trans-Jordan and Palestine.

Iraq lies athwart the principal air lines running from Europe to India and the Far East. Before the war intercontinental services via Iraq were supplied by the British, French and Dutch. At present American air lines are preparing to enter this field.

ROBERT GALE WOOLBERT.

IRELAND, Northern. An area, largely co-extensive with the region of Ulster, in the north of Ireland; consisting of 6 counties and two parliamentary boroughs, closely united with Great Britain under the title of United Kingdom. Area, 5,237 square miles. Capital, Belfast.

Government. Although Northern Ireland is an integral part of the United Kingdom and is represented by 13 members in the British House of Commons, the country exercises a degree of local autonomy through a Parliament of its own and a Cabinet responsible thereto. The Senate of this Parliament has 24 elected and two ex-officio members and the House of Commons has 52 members, all elected. The composition of the House of Commons in 1945, following the general election of

July 10, was as follows: 33 Unionists; 10 Nationalists; 2 Independent Unionists; 2 Labor; 1 Commonwealth Labor; 1 Socialist Republican; 1 Independent Labor; and 2 Independents.

The chief permanent officer is the Governor, Vice-Admiral the Earl of Granville, who succeeded the Duke of Abercorn on Sept. 6, 1945. Head of the Cabinet is Prime Minister Sir Basil Brooke, elected May 6, 1943, and reelected July 10, 1945.

Events, 1945. Polling for a general election in Northern Ireland took place on June 14 and the votes were counted on July 9 and 10. The dominant Unionist Party plainly stood in no danger of losing the election, but their forces were heartened by a characteristic telegram from Prime Minister Winston Churchill of Great Britain in June, saying that at every turn in the "hard and darksome road to victory . . . the loyalty and courage of Ulster have gleamed before the eyes of men." The Unionists concentrated upon maintaining the constitutional position of Northern Ireland, which was not seriously in question.

Against the Unionist victory were set four losses: two seats to Nationalists and two (in the industrial city of Belfast) to Socialists. Against this they had only one gain. The State opening of the sixth Parliament of Northern Ireland was held on July 20, with the Governor, the Duke of Abercorn, reading the king's speech.

The Duke of Abercorn's resignation as Governor was announced in London on July 2 by the Home Office, together with the appointment of his successor, Vice-Admiral the Earl of Granville. The Duke of Abercorn was Governor of Northern Ireland from the time the office was created in 1922, and it fell to him to initiate all the forms and usages of the new office.

The King and Queen, accompanied by Princess Elizabeth, visited Ulster on July 18 and 19. General Dwight D. Eisenhower visited Belfast in late August. He received a surprise ovation at the Belfast Opera House on August 23 and was given the freedom of the city on August 24.

A critical answer to Eire's Prime Minister de Valera's speech of Nov. 6 was made by Prime Minister Sir Basil Brooke on the following day. The statement said in part: "To expect Ulster to become part of the state in which loyalty to the Crown is blatantly repudiated is an outrage on reason and common sense." It said further that although Ulster desired to live on good terms with Eire, it would not be intimidated; and de Valera and other advocates of force were simply blocks to amity.

The budget, presented on Nov. 21 by Minister of Finance J. Maynard Sinclair, showed total revenue at £56,500,000, an imperial contribution of £34,500,000, and expenditure of £21,785,000, with increasing outlays for the social services.

The People. The estimated population of Northern Ireland in 1940 was 1,300,000. Vital statistics for 1943 showed a birth rate of 24.8 per thousand, a death rate of 11.5, and an infant mortality rate of 79 per thousand live births. The latest available figures show religious affiliations as follows: 33 per cent Roman Catholic, 31 per cent Presbyterian, 27 per cent Episcopalian, and the remaining 9 per cent in smaller denominations or unclassified. Educational facilities include elementary, secondary and technical schools with the Queen's University at Belfast at the apex of the structure.

The Economy. Agriculture and manufacturing are the chief occupations. Flax is extensively raised

and livestock production is large in proportion to the size of the country. Agricultural and dairy products find their chief external market in Great Britain. Linen, with 70,000 employees, is one of the chief manufacturing industries, but shipbuilding and repairing machinery in various forms and cotton textiles are also important. Mining, quarrying and fishing occupy appreciable numbers of the population.

ALZADA COMSTOCK.

IRON AND STEEL. The iron and steel industry reverted from khaki to mufti with little change in its basic production processes, but in both war and peace proved so vital that capacity proved insufficient to meet demand in 1945.

Continual shifts in the type of finished products which the industry was asked to produce kept production schedules off balance throughout the year. Concentrated demand first for one type of finished steel, then another, created avalanches which buried specific sections of the industry until swept away by production or cancellation. Weary from meeting the war demands of the United States and its allies for six years, the steel makers turned to the needs of peace to find many new plants built to supply war needs were unsuited for the demands of a peacetime economy hungry for metal products.

Actual production of steel ingots, the unfinished product by which industry activity is gaged, dropped to 79,745,581 tons in 1945 from 89,642,000 tons in 1944. This production, far ahead of any peacetime year, was shaped into 55,691,962 tons of finished steel products, compared with more than 63,500,000 tons in 1944. (The difference between the two figures represents scrap produced in the forming operations which was fed back into the steel making furnaces.)

The changing character of the demand for steel is indicated by the different products the industry was directed to produce during the first nine months of the year by the War Production Board and the materials demanded by its civilian customers the balance of the year. As the Army fought its way through Belgium and Germany in the spring, an artillery shell program larger than any previously during the war overloaded production facilities for special quality "hot-topped" steel to be rolled into round cornered square billets, approximately 4 in. by 4 in. and 6 in. by 6 in. in size. This type of demand came into direct conflict with production of rails, structural shapes, and, in some instances, plates. Yet during the same period demand for plates for shipbuilding was maintained near the high level reached earlier in the war. Armor plate and structural steel for demountable Bailey bridges placed a further load on the facilities for producing heavy products. As victory drew near in Europe, shipbuilding requirements were cut, and the shell program was trimmed although the latter dominated the mills until past mid-year. While the shell steel and plate demand was still the dominating production factor, a mounting clamor for light sheet products provided a gradual shift in emphasis. Oil drums for transporting fuel to the fighting fronts, steel landing mats, steel containers for packing shells (paper had proved unsuitable in the Pacific), and finally steel shelters called for far more tonnage of lighter gage products than the mills could roll. This demand, and an increasing need of steel plate for making bombs, gave the industry no chance to catch its breath with the end of the European war and prevented civilian industries from receiving

much more steel than previously until the last gun was fired at Japan. Production momentum hindered bringing operations to a quick halt on these types of steel with the end of the war and it was not until the last three months of the year that the rolls picked up speed on the pent-up needs of civilian economy.

Then manufacturers filed their needs so rapidly that soon a queue formed to wait for deliveries through the middle of 1946, beyond which few mills would book advance orders. Although there was a waiting list for nearly all types of steel except alloys, again demand was particularly concentrated for a few types, notably light gage sheets and strip needed by the automobile and appliance industries and many others. The impact of peacetime demand is shown by the fact that orders received for steel advanced about 15 per cent over 1944, although production declined.

One phenomenon of the latter stages of the war and the return to peace was the reduction in alloy steel production both in tonnage and in proportion to total steel produced. Alloy steel production hit a peak in 1943 when over 13,000,000 tons were made amounting to nearly 15 per cent of all steel produced that year. In 1945, only about 8,500,000 tons of alloy steel was made, amounting to about 10.7 per cent of total production. The trend is still downward, leading experts to believe alloy demand may be about 8 per cent of the total in 1946, which is about 2 per cent more than prewar. When steel capacity was hurriedly expanded early in the war, great emphasis was placed upon the construction of electric furnaces used principally in making alloy steel. As alloy demand slackened, steel makers turned back to the open hearth furnace, a cheaper method, so that in 1945 the open hearths supplied slightly more than 67 per cent of alloy steel, far more than had been envisioned. In the third quarter of 1945 electric steel making capacity operated at only 51 per cent as against 76 per cent in the third quarter of 1944 and 86 per cent in the first quarter of 1944.

Aside from the changing demand which left idle many electric furnaces and other specialized production units constructed for the war, such as far western capacity built for the shipbuilding industry, the reasons why the industry failed to produce up to its full capacity of 95,500,000 tons a year lay in unofficial retirement of obsolescent high cost facilities, manpower shortages, spasmodic stops and starts to meet production shifts, cold weather early and late in the year, and lack of coal during two coal strikes. Official abandonment of

high cost facilities reduced rated capacity to 91,890,560 tons as of Jan. 1, 1946.

Despite vast strides in the plastics and light metals industries, steel held its place as the major manufacturing material because of its low price in relation to the functions it was able to perform and because of technical advances meeting specialized needs. High strength, low alloy steels appeared certain to be in increased demand particularly in the transportation field. Stainless steel likewise seemed bidding for new popularity as reflected in plants for additional production facilities. Refinement in methods of casting small parts, weighing one quarter pound or less, indicated that many pieces which formerly were machined from bar stock henceforth could be cast directly to tolerances as close as 0.0005 in.

In addition to the expansion in alloy steel production facilities for special war needs, the United States had, during the war, achieved a 100 per cent increase in plate production capacity to more than 12,000,000 tons annually and had spent \$61,000,000 on new facilities in the West, accounting for 19.4 per cent of the total of \$1,862,000,000 spent on steel projects in the entire United States. At the end of the year, the Government had not delved deep into the problem of disposing of surplus facilities which it had constructed. Bids for disposal of the \$200,000,000 Geneva, Utah, steel plant were set for Apr. 1, 1946, and action on this plant disposal was indicated to be a bellwether of policy on sale of the other plants.

Shortage of manpower hampered the iron and steel industry throughout the year, with little improvement even after the end of the Japanese war. Production of the gray iron and malleable foundries was at 50 to 60 per cent of its estimated annual capacity of 19,000,000 tons a year because of a shortage of employees, resulting in a shortage of castings which was a bottleneck both to war production and reconversion. Work stoppages in the coal mines caused far more loss of steel production than temporary local slowdowns and unauthorized strikes in the nation's steel mills. Blast furnaces were banked and open hearths shut down

in Pittsburgh and Birmingham the first week in April due to a temporary unofficial coal strike, but the most serious coal curtailment came during the October strike which also prevented building up winter coal inventories.

Steel prices underwent adjustment on Jan. 11 and May 23 through Office of Price Administration action. Prices of most common carbon steel finished products except hot and cold rolled sheets and strip, tin plate, reinforcing bars, structurals, and sheet piling were advanced on either or both dates, and some semi-finished product prices were included in the May rise.

Pig iron prices were raised \$1.00 per gross ton on Feb. 14 and 75 cents additional on Oct. 22. *The Iron Age* magazine composite finished steel price, representing a weighted average in relation to quantities of individual products shipped, stood at 2.44076 cents per pound at the end of 1945, compared to 2.21189 cents per pound a year previous.

German steel production facilities suffered comparatively little damage during the war, it was revealed. At the end of the war Germany had a capacity of almost 36,000,000 net tons of ingots yearly and was producing at the rate of 27,000,000 net tons yearly. Reports were incomplete on damage to the Japanese industry, but it was indicated to be considerably more severe. Estimated Canadian production for the year was approximately 2,735,000 net tons of ingots compared to 2,878,407 net tons in 1944. Present capacity potentially makes Canada independent of the United States for its steel supply, whereas in prewar days imports were necessary.

The vast appetite of the iron and steel industry for raw materials during wartime has demonstrated that as much iron ore, coke, and scrap was consumed in the three years and five months between the attack on Pearl Harbor and the defeat of Germany as in the eight years from 1932 through 1939. United States production of iron ore during 1945 totalled 88,754,000 gross tons compared to 94,117,705 gross tons, the revised total for 1944. Minnesota, largest producing state, supplied 70 per cent of the total and, together with Michigan and Wisconsin, 85 per cent. Iron ore prices were raised 10 cents per gross ton on Mesabi range ores and 20 cents per gross ton on Old Range ores by OPA action. A potential scrap shortage more serious than any during the war was faced by the industry at the end of the year as flow of material from war plants ceased and production of scrap from reconversion activities had not yet started. U.S. Bureau of Mines records indicated that about 50,000,000 tons of scrap iron and steel was consumed during the year, slightly more than half of it produced in the steel plants themselves and the balance purchased. Production of pig iron from which, with the addition of scrap, steel is refined and which forms the basis of iron foundry operations, totalled (including ferro-alloys made in the blast furnace), about 53,500,000 tons (1944, revised, 61,939,474 net tons).

CHARLES T. POST.

ITALIAN LITERATURE. In 1943 the Italian literature section of this publication came to a regrettable but inevitable interruption. The task was relinquished with nostalgia and not without apprehension that for Italy dolorous days lay ahead, and its soil, so prolific in art, poetry, and incantation, was to undergo the ravage and desolation of war. These war years yielded scant, if any literary production, and the department of History, perforce, monopo-

lized the whole Italian panorama. In fading out of the Italian horizon, Italian literature and scholarship, by some miraculous and fortuitous circumstance found a foster home in America. And Italy, will surely feel gratitude to America, the gracious torch bearer of Italian letters in this war interim. For here not only many of our University Presses but numerous publishing houses magnanimously and courageously (Italy was not on our side for part of the war!) took over the duties of bringing to light many a monograph on special research and many a volume on varied and multiple pursuits: fiction, poetry, biography, philosophy, politics, and, yes, even a cook book! Among the reviews bearing Italian studies, the bulletins of the "Italcica" emerged as of utmost importance. The "Italcica," be it recalled, was founded in 1924 and is the official quarterly bulletin of the American Association of Teachers of Italian. Laudable and conscientious in its work, it was published uninterruptedly, and among its more recent articles, these could be singled out at random: *Leopardi and Impressionism* (March, 1945), *The Living Dante* (June, 1945), *On The Meaning in The Decameron*, and *Le Distrazioni di Ludovico Ariosto* (both, September, 1945).

Two novels published in America on Italian American themes were Jerre Mangioni's *Mount Allegro* (Houghton Mifflin Co., Boston). The scenes in *Mount Allegro* are projected in a "Little Italy" section of Rochester settled by Italians originally emanating from the Province of Girgenti. "They brought with them all their peasant superstitions, their dread of the evil eye, of witches, of direct divine punishment for sin. They brought heroic appetites, a fondness for good wine and for music and endless rounds of family parties. . . . You see the folk of Mount Allegro live their rich lives in America, but not of it. You see them age and die. Finally you see their children emerge as *Americani*, more fiercely loyal to the United States than the children sprung from Mayflower stock, and you understand why there are so many Italian names in current battle casualty lists." In Helen La Penta's *Piccola* (Harper & Brothers, New York) the heroine is a little girl first brought up in Italy then in America. It is a simple and touching narration about a child's strange and vivid world with episodes ending with her adolescence on a New England and New York background. "She is remarkable only in the fact that she grew up under unusual circumstances and was unwilling, or unable, to let any single environment mold her into a conventional pattern of behavior." Though not devoid of a sense of humor, the novel reached but a small public inasmuch as its principal appeal lay in the field of child psychology. Ignazio Silone who made an enviable reputation as an anti-fascist in his novel *Bread and Wine* continued his work in exile publishing this time *The Seed Beneath the Snow* (Harper & Brothers, New York). Pietro, the same hero of *Bread and Wine* is the political renegade in Fascist Italy. Of course this type of novel is already dated and might easily have disintegrated into another mouthpiece for propaganda had it not possessed other values, aptly pointed out by a recent critic in that *The Seed Beneath the Snow* "has indestructible meaning and grandeur, because Silone dramatizes, chiefly within one village (in the Abruzzi), the conflict of two irreconcilable worlds. One is the world of Caesar: petty officials, petty sycophants, sentimental housewives, craven husbands, tame-card priests . . . in short, the dull, timid, heartless ambitious mass of whom, in Silone's opinion, life

is chiefly made. The other is the world of God: the only world in which fearlessness and friendship are possible, and almost nothing else." One can look eagerly forward to a continuation of Silone's creation within a new Italy and an Italy at peace. W. P. Crozier, editor of *The Manchester Guardian*, published a second very entertaining and distinguished novel, *The Fates Are Laughing* (Harcourt, Brace and Co., New York) portraying the Rome of Tiberius and Caligula. *The Letters of Pontius Pilate*, published some twenty years ago, established the author as an adept master in projecting history on an imaginative canvas to bring vividly to life the ways and habits of the ancient Romans. *The Fates Are Laughing* appeared post-humously for Mr. Crozier died just after the proof-reading. With but few exceptions the pseudo-historical novels of this type, particularly those dealing with ancient Rome, have been "either ponderous literary documents or highly colored romances." This novel which W. P. Crozier did not live to see published, escaped the pitfalls of boredom and exaggeration, and offered to the contrary a portrayal of life among the ancient Romans with "delicious ironic humor and incomparable ease."

Many and varied were the biographies on the great Italian personalities, and a few can be recorded here without setting off any in order of importance. First at hand may be mentioned Count Carlo Boeuf's Renaissance figure, *Cesare Borgia, The Machiavellian Prince* (Oxford University Press). Time and again Cesare Borgia has been depicted as a sinister and ruthless prince, and the author of the present volume did not set out to prove or disprove the deeds of Borgia, the villain, but simply to picture his personality in a quietly reasoned and objective study. The result draws one into believing that Cesare is not as frightful as history has made him. Count Carlo Boeuf has obviously tried to be very fair in dealing with this enigmatic figure, and to be sure, he has made interesting reading material; but history has long ago "jelled" the character of this famous man and the mere mention of Cesare Borgia will always conjure up cunning and violence. Vernon J. Bourke prepared a comprehensive study of Saint Augustine, *Augustine's Quest of Wisdom* (Bruce Publishing Co., New York). In a "fast-moving narrative" the author has presented "all the Augustinian views on God, man, and the universe." A famous trio, Columbus, Amerigo Vespucci and Marco Polo, among Italy's navigators, travelers, and explorers, received broad as well as detailed study. In *Admiral of the Ocean Sea, A Life of Christopher Columbus* (Little, Brown & Co., Atlantic Monthly Press, Boston) Samuel Eliot Morison, scholar, seaman, historian, examined painstakingly all the records on the famous Genoese, and even put to sea along the courses taken by the Great Admiral in order to elucidate beyond any doubt some of the garbled and obscure historical data attached to this famous personality. This monumental work came out in two editions, one, handsomely assembled with illustrations, maps and drawings, and fully annotated in two volumes, the other in one volume, also with maps and illustrations. Amerigo Vespucci had two biographers. Stefan Zweig (now deceased) sought to clear up much of the vilification of the Florentine after whom America was named in *Amerigo, A Comedy of Errors In History* (The Viking Press, New York). The work was translated and prepared with maps and facsimiles by Andrew St. James. Though Stefan Zweig had a facile and artistic pen, the job of establishing a truer position

in history of our Piloto Mayor was left to Frederick J. Pohl in his succinct and convincing study. *Amerigo Vespucci, Pilot Major* (Columbia University Press, New York). The edition was well prepared with numerous designs, maps and illustrations. Lastly, in the trio, was Henry H. Hart's Marco Polo, *Venetian Adventurer: An Account of the Life and Times and of the Book of Messer Marco Polo* (Stanford University Press, Cal.). The work was hailed as a "full and living recreation of that legendary yet vitally real and important thirteenth century hero." From Chapel Hill, University of North Carolina Press, came a gracious and graceful volume, edited with care and good taste by Hardin Craig, *Machiavelli's The Prince, An Elizabethan Translation*. The translation was taken from a recently discovered manuscript found in London and now forming a part of the Jules Furthman collection (Los Angeles).

Varia. The period saw the passing of Italy's most famous contemporary historian, Guglielmo Ferrero, especially known here for his *Greatness and Decline of the Roman Empire*. Not just an objective historian, Signor Ferrero's interpretation of history was scintillating and full of invective allusions. His ultimate greatness lay in his ability to mold the historic idiom into one of literature. In fact, in recent years, he devoted his energies toward the creation of the historico-fictional novels, *The Third Rome*, *The Two Truths*, and *The Son's Revolt*. And now, at random, could be recorded books of various categories. First, the timely political creed of Italy's foremost philosopher, Benedetto Croce, was published in a translation done by Salvatore J. Castiglione, *Politics and Morals* (Philosophical Library, New York). Vincent Sheean translated four recent essays of Croce, *Germany and Europe, A Spiritual Dissension* (Random House, New York). In this connection could be mentioned a translation of *The Autobiography of Gianbattista Vico*, carefully prepared in a handsome volume by Max Harold Fisch and Thomas Goddard Bergin and published by the Cornell University Press (Ithaca, New York). The charming Roman dialect that the poet Trilussa made so famous throughout the world brightened his poems and fables, were published in part by an enterprising young editor, S. F. Vanni (New York), who already has brought out serious and scholarly works such as Professor Pei's *Italian Grammar and Languages for War and Peace*. *Trilussa's Roman Satirical Poems* have the Italian text on one page and Grant Showerman's translation on the opposite. The two artistic giants, of the Renaissance, Leonardo and Michelangelo, had separate biographies; Leo Lerman gave a full-bodied account of Michelangelo's life in his lengthy and richly illustrated book, *Michelangelo, A Renaissance Profile* (Alfred A. Knopf, New York); and Elizabeth Hubbard Lansing wrote of *Leonardo, Master of the Renaissance*. This volume, with an introduction by Hendrik Willem van Loon, follows the usual pattern of romanticized biographies in trying to recreate the life and mood of the period. The illustrations seem to be quite poor. While speaking of the Renaissance, mention should be made of a new pocket-size edition of Jacob Burckhardt's great work, *Civilization of the Renaissance in Italy* (Oxford University Press, New York). In conclusion, various specialized works might be recorded. *A Literary History of the Italian People* by the distinguished Italianist, Joseph Spencer Kennard, continued to be read in the past few seasons. Count Carlo Sforza dedicated his volume, *The Real Italians*,

(Columbia University Press, New York) to "the Italians and sons of Italians in Canada and the two Americas I dedicate these pages, dictated by an unshaken faith in our future . . ." *Translations from Leopardi* by R. C. Trevelyan was published by the Cambridge University Press, Cambridge. It includes fourteen of the poems in the *Canti* and the *Dialogue Between Torquato Tasso and His Familiar Spirit*. Lastly may be recorded a beautifully prepared volume of Michelangelo's *Rime*, the poems of the great master published by Viau of Buenos Aires.

O. A. BONTEMPO.

ITALY. A kingdom of southern Europe, upon which a Fascist dictatorship was superimposed from Oct. 22, 1922, to July 25, 1943. An armistice was concluded with the Allies during September, 1943. King: Victor Emmanuel III (ascended the throne July 29, 1900) who retired from public life on June 4, 1944, but he did not abdicate. A royal decree of June 5, 1944, nominated Crown Prince Umberto as "Lieutenant-General of the Realm."

Area and Population. Italy had an area of 119,764 square miles (1936). Population (Oct. 31 1943): 45,637,000, compared with (1936 census) 42,993,602 (31,735,027 urban and 11,258,575 rural residents). There were 67,063 emigrants in 1940. Vital statistics (rate per 1,000; based on Jan.-June, 1943): 20.5 live births, 14.2 deaths, 5.6 marriages. The infant mortality rate (deaths under one year per 1,000 live births) was 108 for 1942.

Rome, the capital, had an estimated population of 1,480,253 on Mar. 1, 1943. Other important cities (with estimated populations on Jan. 1, 1939, exclusive of workmen and soldiers in the Dodecanese and in Africa) were: Milan, 1,205,542; Naples, 920,460; Turin, 690,015; Genoa, 654,211; Palermo, 431,666; Florence, 351,055; Bologna, 315,158; Venice, 283,926; Trieste, 258,612; Catania, 251,978; Bari, 210,777; Messina, 202,375; Verona, 166,315; Padua, 150,203; Taranto, 151,150; Leghorn, 134,545; Brescia, 134,340; Ferrara, 122,913; Reggio di Calabria, 121,876; Cagliari, 119,934; La Spezia, 119,067.

Colonial Empire. When Italy entered World War II as an Axis partner of Nazi Germany, it had an overseas empire (including Albania and Libya) of 1,279,589 square miles with an estimated population of about 14,186,400. By the end of 1943, the Italians had lost effective control of the whole of their overseas empire. British and Allied forces occupied Eritrea, Ethiopia, and Italian Somaliland in 1941 and Libya in 1942-43. During 1943 and 1944 Albania and the Italian Aegean Islands as well as the territories annexed from Yugoslavia were occupied by either Allied or German troops. After the unconditional surrender of Germany in September, 1945, all Italian territory occupied by German troops passed into Allied control.

Education and Religion. School enrollment in 1937-38 was: elementary, 5,051,306; secondary (including technical and art), 613,588; higher education (1938-39), 77,429. One out of every five adults is illiterate. According to the census of 1931 there were 41,014,096 Roman Catholics (99.6 percent), 83,618 Protestants, and 47,825 Jews.

Production. About 46.3 percent of the working population was engaged in agriculture and fishing in 1939, 30.4 percent in mining, quarrying, and industry, 8.3 percent in commerce, and 4.6 percent in transportation. The wheat harvest was estimated at 4,180,000 metric tons—the smallest crop since 1920 and roughly two-thirds of the 1944 wheat crop. The output of barley, oats, and rye in

1945 was about two-thirds of the 1944 output. The 1945 corn crop was normal at 230,000 tons. Rice produced in 1945 was estimated at 400,000 tons which was below the normal yield. Dry legumes (beans, peas, and broad beans) suffered heavily. The 1945 olive crop was estimated at 950,000, and the output of grapes, other fruits, and vegetables was good. Other important crops are sugar beets, cotton, linseed, flax, and raw silk.

Mineral and metallurgical products included petroleum, coal, pyrites, sulfur, iron ore, pig iron and ferro-alloys, steel, lead, zinc, bauxite, aluminum, quicksilver, and silver, textiles, rayon and staple fibers, refined sugar, cheese, and macaroni are important industrial products. In 1941 the output of electric current amounted to 21 billion kwh.

Foreign Trade. Publication of official trade statistics was suspended after Italy entered the war. However, unofficial figures indicated that imports in 1940 totaled 12,908,000,000 lire (9,938,000,000 in 1939) and exports 9,244,000,000 lire (8,160,000,000 in 1939). These figures exclude trade with the Italian colonies.

Finance. Budget (1944-45): revenue 12,938,000,000 lire; expenditure 129,071,000,000 lire (ordinary 33,658,000,000 lire, extraordinary 95,413,000,000 lire). War expenditure for 1944-45 (included in the foregoing figures) totaled 32,700,000,000 lire. The minister of reconstruction on Oct. 24, 1945, summarized the financial situation of Italy as including a public debt of about 1,000 billion lire, a current budget deficit of 350 billion lire, and a total currency circulation of 350 billion lire.

Transportation. In 1941-42 there were 14,448 miles of railway lines, and 128,830 miles of roads. Shipping in control of the Italian merchant marine on Sept. 1, 1945, totaled 500,000 gross tons; in addition 300,000 tons of that sunk in Italian ports or along the Italian coast during World War II was considered salvageable. On June 10, 1940, Italian shipping totaled 3,537,000 gross tons, of which 900,000 tons were in enemy and neutral ports.

Government. With the overthrow of the Fascist dictatorship on July 25, 1943, Italy reverted to the status of a constitutional monarchy as established by the Constitution of Mar. 4, 1848 (see the 1943 YEAR BOOK for the principal features of the Fascist regime). That part of Italy under Anglo-American control was temporarily administered by the AMG (Allied Military Government of Occupied Territory) with the assistance of the Royal Government, headed by Crown Prince Umberto after the liberation of Rome. The German-held areas were ruled by German military authorities with the aid of an Italian Fascist puppet regime (see below under *Events*).

On June 10, 1940, the Italian Government declared Italy at war with France and Great Britain, effective the following day. An armistice with the Vichy Government of France was signed the following June 24. Italy attacked Greece without a declaration of war (Oct. 28, 1940), and joined Germany in the invasion of Yugoslavia (Apr. 6, 1941) and of Russia (June 22, 1941) and in declaring a state of war with the United States (Dec. 11, 1941). For details of Italy's withdrawal from the war, see YEAR BOOK for 1943; for developments during 1945, see below.

Events, 1945. For the frustrated and impoverished people of Italy the year, even more than its predecessor, was a grey interlude between a past of darkness, still lying heavily over the land, and a future of light as yet too pale to conquer night. War on the Reich brought no alliance with the Allies. War's end brought an end to the life and

works of Il Duce. But it brought no peace treaty to the prostrated kingdom and no resolution of its problems in the successive crises of the year of victory. The spokesmen of a new life, ever disappointed but persisting in their hopes, vied for popular favor with the apostles of despair, cynicism and neo-fascism. Hunger in January became misery in December, with few finding sustenance in any of the intervening changes of the Italian kaleidoscope.

The Politics of Poverty. The "co-belligerent" Government of Premier Bonomi and Prince Humbert, Lieutenant General of the Realm, was faced at the dawn of the year with the tasks of alleviating mass joblessness and starvation, as was the Allied Commission under Harold MacMillan. The Roosevelt-Churchill program of September, 1944, for increasing supplies to Italy, like the President's order of December to raise the Italian bread ration from 200 to 300 grams daily, was still unfulfilled, thanks to shipping shortages and Anglo-American differences regarding its implementation. Alexander C. Kirk, first U.S. Ambassador to the new regime, presented his letter of credence at the Quirinal on Jan. 8, but was unable to bring calories along with credentials. The collapse of the rationing system obliged many to resort to the black market or to rely on Vatican charity, which supplied 200,000 cheap meals daily in central Italy from Allied stores. Less fortunate Italians faced famine and inflation as best they could. Churchill's statement of January 18 that "we need Italy no more than we need Spain" added insult to injury.

These woes discouraged enrolment in the new Army (begun on Jan. 20) and led to student demonstrations and sporadic rioting. While the Cabinet asked material aid and relief from the fiscal burdens of the armistice, "Separatists" in Sicily agitated for autonomy or independence. New disappointment was felt when the Yalta Conference communiqué failed to mention Italy. In late February the Cabinet announced economies, higher taxes, a state loan and other measures designed to combat inflation and the black market. Not until March 1, however, was the promise of 300 daily grams of bread realized.

With painful slowness and in the face of many obstacles, the Bonomi regime restored Italy's diplomatic relations and obtained gradually increasing relief supplies. Ambassador Alberto Tarchiani presented his credentials in Washington on March 8. Roosevelt bespoke friendship, understanding, and hope. A fortnight later Giuseppe Saragat was named Ambassador to France. Meanwhile, on Feb. 25, the Allied Commission transferred to the Italian Government most of its authority throughout the liberated regions (except military zones near the front), thereby enabling the Cabinet to conduct foreign relations, make appointments and enact legislation without the approval of the Commission. A month later a joint program was evolved for increasing imports as a means of promoting agricultural and industrial rehabilitation.

By midsummer Rome had recovered control of the North, except for disputed frontier areas, and permission to conduct most foreign trade through Italian rather than Allied channels. On the proposal of the United States and over the objection of Yugoslavia, the Council of UNRRA voted on Aug. 22 to include Italy in its relief program. On September 1 the military relief program was replaced by FEA's interim program of \$100,000,000, to be extended until Dec. 31, after which UNRRA's program of \$450,000,000 for 1946 was to be inaugurated. Said Spurgeon M. Keeny, Chief of the

Italian Mission of UNRRA, on October 9: "Men and women dig entire fields by hand for the lack of animals to pull the plow. The wheat crop is the worst in 20 years. Prices are so high that the average family's earnings must nearly all go for food. A shirt costs \$15, a pair of men's shoes \$50. . . ." Despite some signs of convalescence, the sick Italy of the new era of peace was still a charity patient.

Pseudo-Caesar's Demise. Benito Mussolini—driven from power in July 1943, rescued from his foes by the northern barbarians, and propped up as head of the "Republican Fascist" regime behind the German lines—became a corpse with the collapse of the Wehrmacht. Further details of his follies and crimes—e.g. his connivance in the murder in France of Carlo and Nello Roselli, 1937—were revealed through the purge trials and the posthumous publication of Count Ciano's diary. During winter and early spring Mussolini lived on Lake Garda, near the villa of his mistress, Clara Petacci, and posed and postured with all of his waning powers as head of the puppet Cabinet. That he still had followers in the South was shown by the ease with which General Mario Roatta, chief defendant in a trial of Fascist criminals, escaped on March 4 from an army hospital in Rome; by the arrest during March and April of numerous Fascist agitators behind the Allied lines; and by reports of an underground Fascist Party of 20,000 members.

In preparation for the final Allied offensive on the Italian front, AMG made efforts to remember the "forgotten men"—the partisans and the Committee of National Liberation (CNL) of the North. Bologna was liberated on April 21. Giuseppe Dozza, Communist appointee of the CNL, was confirmed as mayor by AMG. While Prince Humbert was received with considerable acclaim by the inhabitants, Mussolini in disguise sought to flee northward from Milan. He was seized by partisans at Nesso on Lake Como on April 26, along with Roberto Farinacci, Achille Starace, and Alessandro Pavolini, all of whom were at once tried and executed. Marshal Rodolfo Graziani was captured nearby and reported to have been put to death.

On April 29, as Allied troops entered the city, Mussolini returned to Milan where he had founded the Fascist Party. He made no speeches. His body lay on the floor of a moving van, alongside his mistress and a dozen Fascists shot with him on the preceding day. The cadaver, after being manhandled by a mob, was strung up by the feet in the Piazza Loretto like a butchered pig, next to that of Clara Petacci, to be gaped at by the curious and the vengeful. The *Osservatore Romano*, Vatican organ, sounded the only note of dissent in the chorus of satisfaction with which the Italian press greeted the news. On the last day of April, Mussolini, Starace, and Clara were buried in the paupers' section of the Cimitero Maggiore. This ugly end of an ugly life marked *finis* to an epoch of fear and horror for Italy and all the world.

Pax and Purge. On April 29 enemy forces in North Italy and Austria surrendered unconditionally. Hostilities ceased at noon on May 2 under the terms signed in Caserta by an agent of Kesselring's successor, Col. Gen. Heinrich von Vietinghoff. Almost a million Axis troops became prisoners. Gen. Mark Clark at once ordered the partisans to maintain discipline and to cease attacks on German units. A thousand Fascists were shot in Milan as partisan violence swept through the Po Valley. A fortnight later leaders of all six parties of the CNL, including Premier Bonomi, Foreign Minister Alcide de Gasperi, Communist Vice Premier Palmiro To-

gliatti and Socialist Pietro Nenni, visited Milan on a tour of the North. On the 20th Nenni was arrested by British police at Vercelli for delivering an unauthorized speech to workers. He was soon released without trial, with his prestige enhanced, rather than diminished, by the episode.

The liquidation of *Fascismo*, partly by mob violence and partly by judicial process, was accelerated by the end of the war. Fulvio Suvich had been sentenced to 24 years' imprisonment on March 12. The missing Roatta received a life term. For remarking at a dinner that he would have shot the judges at the Suvich-Roatta trial, the Duke of Aosta, cousin of the Sovereign and erstwhile "King of Croatia," was dismissed from his post of Admiral by Prince Humbert. In Milan Guido Donegani, ex-President of the National Fascist Federation of Industries, escaped from prison in mid-July, allegedly by bribery, and fled to Switzerland. Numerous other Fascists were tried and sentenced during the course of the year. Donna Rachele, Mussolini's widow, was interned in Terni. Il Duce's daughter, Edda (Countess Ciano), returned from Switzerland and was sent to Lipari Island, though neither she nor her mother were prosecuted as war criminals.

Storm over Trieste. Far from simplifying Italy's foreign relations, the collapse of the Reich raised many new problems, the most pressing of which was the status of Venezia Giulia, with its Slovene population in the hinterland of the Istrian Peninsula. On April 30 Marshal Tito's forces entered Trieste, where they set up a civil administration and convoked a "General Assembly." Bonomi proposed to the Allied Commission that the province be under Allied rather than Yugoslav occupation. As New Zealand troops arrived in Trieste and Gorizia on May 2, over Tito's protest, Communists in Rome attacked student demonstrators who were shouting "Trieste is Italian!" The Communist Party, however, shared this sentiment and was no less opposed than other parties to any cessions of territories containing Italian majorities.

On May 12, as Bonomi renewed his plea for Allied occupation of Trieste, Acting Secretary of State Joseph C. Grew expressed American opposition to Tito's unilateral action. Two days later Washington and London sent notes to Belgrade contending that Trieste and Istria, being Italian territories when the armistice was signed, must remain under Allied control. A similar view was taken of Greek designs on Rhodes and the Dodecanese Islands and of French hopes of annexing Aosta and a strip of Piedmont. Allied troops and warships at Trieste lent weight to the protest. Said Field Marshal Sir Harold Alexander on the 19th: "It is our duty to hold these disputed territories as trustees until their ultimate disposal is settled at the peace conference. . . . We are now waiting to hear whether Marshal Tito is prepared to co-operate in accepting a peaceful settlement of his territorial claims or whether he will attempt to establish them by force." Tito was accused of repudiating an earlier agreement. On the 20th an American battalion withdrew from Trieste in anticipation of possible hostilities.

Marshal Tito accepted Allied proposals "in principle" on May 22 after complex negotiations which continued for several more weeks. On June 9 the State Department announced an Anglo-American-Yugoslav accord by which the western portion of Istria, including Trieste, would be under the Supreme Allied Commander and AMG, with all Yugoslav forces to be withdrawn by June 12 save for a military mission and a detachment of 2,000

men. Tito's forces were promptly evacuated, with the ultimate disposition of the territory and the fixing of the boundary left for later consideration. The most acute inter-Allied crisis of the spring was thus resolved with the Italian Government as an interested but impotent bystander.

From Bonomi to Parri. The Bonomi Cabinet (See YEAR BOOK for 1944, pp. 310 f.) had meanwhile faced the necessity of resigning in accordance with its pledge to step down when the North should be liberated. Early in March rioting in Rome over the escape of Roatta led to demands for Bonomi's resignation. The result was the transfer of authority over the purge to a four-man commission, representing the four parties in the Government: Communists, Liberals, Christian Democrats, and Labor Democrats. The other two parties of the CNL, Socialists and Actionists, remained in "opposition." Humbert's post-victory tour of the North, where he was cheered in Bologna and allegedly fired upon in Milan, revived controversy between monarchists and republicans. Following extended conferences in Rome between party leaders and representatives of the CNL groups in the liberated regions, Bonomi threatened on June 8 to resign and throw the issue of a broadened Cabinet into the hands of Humbert. Prof. Ferruccio Parri, northern leader of the anti-monarchist Actionists who was prominently mentioned as Bonomi's successor, declared "You can strike me off your list. If I were chosen I should regret that the SS didn't have me shot."

Despite his modesty, this courageous partisan leader and staunchly anti-Fascist Genoese inherited Bonomi's post. The latter formally resigned on June 12 but agreed to head a "caretaker government" until Humbert could find a successor acceptable to all the parties of the CNL. The Prince was pained at Nenni's insistence that a constituent assembly was needed to decide the fate of the monarchy. The Allied Commission was said to have warned Bonomi that his successor must observe the armistice terms and maintain the "truce" on the question of the monarchy. After further consultations, Nenni announced on June 17 that the CNL had accepted Parri. The new Cabinet, announced on the 19th and sworn in two days later included all six parties of the CNL:

Premier and Minister of the Interior—Ferruccio Parri, Actionist.
 Vice Premiers—Pietro Nenni, Socialist, and Mauro Brossio, Liberal.
 Foreign Affairs—Alcide de Gasperi, Christian Democrat.
 Justice—Palmiro Togliatti, Communist.
 Finance—Mauro Scoccimarro, Communist.
 Treasury—Marcello Soleri, Liberal.
 Agriculture—Fausto Gullo, Communist.
 Education—Vincenzo Arangio Ruiz, Liberal.
 Transport—Ugo La Malfa, Actionist.
 Reconstruction—Meuccio Ruini, Labor Democrat.
 Industry and Commerce—Giovanni Gronchi, Christian Democrat.
 Food—Enrico Mole, Labor Democrat.
 Post-War Relief—Emilio Luasu, Actionist.
 Public Works—Giuseppe Romita, Socialist.
 Labor and Social Welfare—Gaetano Barbareschi, Socialist.
 War—Stefan Jacini, Christian Democrat.
 Air—Mario Cevolotto, Labor Democrat.
 Navy—Admiral De Courten, Independent.

The new regime strove for economic reconstruction, the election of a Constituent Assembly, termination of the armistice by a peace treaty, and control of the northern provinces, still under AMG. But most of its hopes were hopes deferred. An Italian declaration of war on Japan (July 13) produced no immediate change in Allied policy. Socialists and other republicans hailed the victory of the British Labor Party as a favorable omen. In an article of Sept. 2 in the Roman *Nuova Europa*,

Harold J. Laski urged Nenni to aim at a republic, at socialization, and an end of the Vatican concordat, but reproved him for favoring a union of Socialists and Communists. Summer's end registered little progress toward the achievement of any of the Cabinet's major goals.

Stalemate in Peace-making. Without a treaty defining frontiers, fixing reparations, establishing the status of the colonies, and governing the new Italy's relations with other Powers, few effective steps could be taken to grapple with domestic institutional and economic problems. Rome welcomed the Potsdam decision to entrust the drafting of a treaty to the new Council of Foreign Ministers. Field Marshal Alexander, Ambassadors Kirk and Sir Charles Noel and Rear Admiral Ellery W. Stone, now head of the Allied Commission, were reported to have urged upon Truman and Attlee a settlement involving Italian retention of Tripolitania (western Libya), entry into the UNO, restoration of an Italian Army and Navy, and elections under Allied supervision, all as a means of keeping Italy within a "Western Bloc" and out of the range of Soviet influence. In the State Department those of similar mind were said to be opposed to converting the Italian colonies into UNO trust territories (with possible Soviet participation) and to favor their return to Italy as a buffer against Russia.

Although these counsels did not prevail, other rifts among the Big Three doomed the September meeting of the Council of Foreign Ministers to failure. The U.S. delegation submitted proposals contemplating no changes in the Italian frontiers with France, Switzerland and Austria; acceptance of the old "Wilson Line," with minor changes, as the Italian-Yugoslav frontier, with Trieste (as a free port) remaining Italian, but with Zara and the Dalmatian Islands ceded to Yugoslavia; cession of the Dodecanese Islands to Greece; conversion of Libya, Eritrea, and Somaliland into UNO trust territories, with the first two to become independent in ten years; limitation of Italian armament; restriction of reparations to Italian assets within the jurisdiction of the United Nations; and enactment of an Italian bill of rights. Foreign Minister Alcide de Gasperi, who arrived in London on September 16, repressed his inevitable disappointment at the proposed disposition of the Italian colonies and countered a Yugoslav memorandum asking for all of Venezia Giulia with an Italian memorandum championing the Wilson Line, plus a special status for Fiume and Zara. When Molotov urged that Trieste should go to Yugoslavia and expressed Moscow's willingness to assume a trusteeship over Tripolitania, the Ministers referred the whole issue to their deputies and experts for further study.

The deadlock in the Council, which ended in discord on Oct. 3, left all these questions unresolved. The U.S.S.R. urged a \$300,000,000 reparations bill for Italy, with the proceeds to be divided among the Soviet Union, Yugoslavia, Albania and Greece, and opposed the replacement of the armistice terms by an interim arrangement. The text of the armistice of Sept. 24, 1943, was released on Nov. 6, 1945, but it contained no surprises and no clues as to why it had been kept secret so long. "There is talk of fantastic reparations being demanded of Italy," said Gasperi early in November, "together with spoliation of our colonies and of those territories we gained during the last war. . . . Our aid must not be forgotten. We appeal to General Clark and Admiral Cunningham to remember the activities of both the Italian partisans

and the Italian forces that fought shoulder to shoulder with the Allies."

From Parri to Gasperi. In a realm whose rulers are at the mercy of others who have not yet reached decisions, all politics becomes futile juggling with unrealities. Parri admitted fatigue and bewilderment. Increasingly vehement criticisms of Humbert and the monarchy during October caused the Liberals and the monarchists to accuse the Premier of breaking the "truce" on the institutional question and thus violating his oath of office. Nenni, now in charge of the purge and of preparations for the Constituent Assembly, was assailed by the Liberals and other Rightists. On November 22 two Liberals, Brosio and Ruiz, left the Cabinet. Parri resigned on the 24th, warning his successors to beware of resurgent Fascism and of possible civil war.

The ensuing crisis was revealing of new forces at work but, in the mode of its resolution, changed nothing. The aged Vittorio Orlando, who was anathema to the Left, reported to Humbert on the 27th that he had been unable to form a Cabinet of "national union." Francisco Nitti's aspirations were frustrated for similar reasons. On November 30, to the tune of rioting in the South against the high cost of living, the six parties of the CNL agreed on Gasperi as Premier. His party, the Christian Democrats, stood to the right of center. The liberals, however, still balked. The new Cabinet was not chosen until December 9 in an atmosphere of tedium and weariness. Brosio and Nenni remained Vice Premiers. Leone Cattani, secretary of the Liberal Party, became Minister of Public Works. Gasperi remained Foreign Minister as well as Premier. The Cabinet contained only three new names. Save for promising an end of the purge by March 31 and elections for a Constituent Assembly by April 30, 1946, the Gasperi regime was indistinguishable in policy from its predecessor.

The Poverty of Politics. Italy's plight, both at home and abroad, fostered anew those attitudes of indifference and defeatism which had once paved the way for Fascism. The success of the Moscow Conference and the resultant promise of new progress toward treaty-making (mingled with fears that Italy was to be treated as an "enemy" rather than as a "co-belligerent") were no more able to lift Italian spirits than the prospect of elections and a new Constitution. The poor, miserable in their poverty, saw little hope from the Left. The rich, fearful for their privileges, raised once more the bogey of Communism. Among the symptoms of neo-Fascism, the most striking was the weekly *L'Uomo Qualunque* (*The Common Man*), published by ex-Fascist Guglielmo Giannini, a Neapolitan addicted to monocles, pistols and bodyguards. He condemned the purge, praised Mussolini with faint damns, denounced all politicians, demanded an "Administrative State," and promised that his supporters would win control of the Constituent Assembly and retain power for 20 years. His journal rapidly won a circulation of 800,000, with most of the paper acquired in the black market.

Although the United Nations would plainly not permit the advent of a new Fascism in Italy, it was not clear by the close of the year that the CNL, or any part of it, could create a new democracy in the atmosphere of hunger and despair which prevailed. Ambassador Tarchiani's words of April, spoken in New York at the HQ of American Relief for Italy, Inc., were still true in December in their hopes as well as in their fears: "Problems cannot be solved by words. People who cannot eat cannot make politics. They are a luxury that is not

intended for hungry people. The past is gone. The Italian people, even those who had faith in Fascism, have learned a lesson from hard experience. . . . The present is difficult. The future does not yet look bright. It is for us to prepare for a better, democratic future that will give the children of Italy, together with the children of all the rest of the world, their chance in life."

See FRANCE, GREAT BRITAIN, YUGOSLAVIA, U.S.S.R., UNITED NATIONS, UNITED STATES.

FREDERICK L. SCHUMAN.

JALUIT. The chief island (169° 42' E. and 5° 48' N.) in the Marshall group of the Japanese Pacific Islands (which see). Area, 8 square miles. Civil population (1938), 10,546 (10,038 natives and 504 Japanese). Copra was the principal export. The island has been under the control of United States armed forces since the defeat of Japan in 1945.

JAMES FOUNDATION OF NEW YORK, Inc., was incorporated Aug. 23, 1941, under the Membership Corporation Law of the State of New York, pursuant to the provisions of the will of the late Arthur Curtiss James who died on June 4, 1941. The Foundation will receive, upon the conclusion of the executorial administration of the estate of Arthur Curtiss James, the residuary estate, the amount of which is not yet determined. The income of the funds received, and ultimately the principal of the funds, will be distributed through organized religious, educational, and other charitable corporations. The officer is William W. Carman, President. Trustees: William W. Carman, Robert E. Coulson, Williamson Pell, and Wm. B. Warner. Offices: 40 Wall Street, New York City.

JAN MAYEN. An arctic island between Greenland and northern Norway, 220 miles north-northeast of Iceland. Area, 144 square miles. It is mountainous, Mt. Beerenberg in the north being 8,350 feet high. A meteorological station was established on the island by Norwegians in 1921. The island was formally annexed by Norway on Feb. 27, 1930.

JAPAN. A country of Far Eastern Asia, comprising four main islands (Hokkaido, Honshu, Kyushu, and Shikoku) and a number of smaller islands. Japan and her overseas possessions and conquests passed under the control of Allied armed forces following the surrender of Japan in 1945. Territories which Japan relinquished included Formosa, Japanese Pacific Islands, Korea, Kuriles, Kwantung, Manchukuo, and the southern half of Sakhalin (Karafuto). Emperor of Japan: Hirohito (ascended the throne, Dec. 25, 1926).

Area and Population. Japan proper had an area of 143,667, exclusive of the Kuriles (3,944 sq. mi.) which were occupied by the U.S.S.R. after V-J Day in 1945. Japan proper had a population (1940 census) of 73,114,308 (male 36,566,010, female 36,548,297). There was an increase of 5.6 percent in the population of Japan proper during the intercensal period 1935-40. Vital statistics (rate per 1,000) for 1941: births 29.9, deaths 15.4. Chief cities (1940 census): Tokyo (capital) 7,778,804, Osaka 3,252,340, Nagoya 1,328,084, Kyoto 1,089,726, Yokohama 968,091, Kobe 967,234, Hiroshima 343,968, Fukuoka 306,763, Kawasaki 300,777, Yawata 261,309, Kokura 173,638.

Production. In prewar times manufacturing accounted for about 33 percent of the national income, commerce for 26 percent, and agriculture for 17.7 percent. The chief crops (in metric tons) were: rough rice 11,372,900 in 1943-44, wheat

1,096,600 in 1943-44, barley 1,656,400 in 1942-43, potatoes 2,025,000 in 1943-44, beet sugar 40,000 in 1941-42, cane sugar 84,000 in 1941-42, tobacco 87,100 in 1940-41, tea (exports) 57,500 in 1939, rapeseed 103,200 in 1941, soybeans 348,300 in 1938, raw silk (exports) 29,000. In 1936 the sea-fisheries catch totaled 3,622,000 metric tons, valued at 334 million yen.

Livestock (1938): 7,666,890 cattle, 9,467,400 sheep, 1,828,070 goats, 791,390 donkeys, 791,120 horses, 431,150 mules. In 1940 Japan exported 1,800 million sq. yd. of cotton cloth. The output of rayon and staple fiber during 1942 totaled 135,000 metric tons and 180,000 metric tons, respectively. Other important manufactured products were: cement, newsprint, and motor vehicles. The annual capacity of merchant shipbuilding yards was 500,000 tons.

Minerals and metallurgical output included steel, pig iron, coal, petroleum, copper, magnesium, aluminum, iron ore, lead, zinc, and gold. Electric power capacity in 1941 was estimated at 8 million kilowatts. See **Events**.

Foreign Trade. For Japan proper in 1940, excluding trade with other parts of the empire, imports were valued at 2,492,000,000 yen; exports 2,753,000,000 yen. The aggregate figures of trade in 1940, for Japan, Korea, and Formosa were: imports 3,708,000,000 yen; exports 3,970,000,000 yen. Before Japan entered World War II, trade was mainly with China, British India, Netherlands East Indies, and Great Britain, in the order named.

Finance. The budget for the fiscal year ending Mar. 31, 1945, was balanced at 50,967,000,000 yen. The Finance Ministry completed the first draft of the budget for 1946 on Jan. 2, 1946. It estimated revenue at 15,900,000,000 yen and expenditure at 12,600,000,000 yen. The government debt in December, 1945, was about 170 billion yen. Notes in circulation at the end of July, 1945, totaled 28,456 million yen. The average exchange value of the yen was \$0.2344 in 1940 and 1941; it rose to \$0.27 just prior to Japan's attack upon the United States and Great Britain on Dec. 7-8, 1941.

Transportation. In 1938 there were 15,364 miles of railway lines, of which 11,144 miles were state-owned. Highways extended 591,766 miles in 1940. The air routes totaled 9,598 miles on August, 1939.

Government. The parliamentary system of government established under the Constitution of Feb. 11, 1889 (see **YEAR BOOK** for 1941, p. 303) fell increasingly under the control of Japanese militarist-fascist elements after the conquest of Manchuria in 1931. Beginning in 1940, a totalitarian, corporative state was superimposed upon the old constitutional system by Premier Prince Konoye, the announced aim being state control of all economic, political, and cultural activities. The first step was the "voluntary" dissolution of the old political parties, some of them acting under strong military pressure. A new political agency, known as the Imperial Rule Assistance Association or League for Support of the Throne, was then created by the army leaders and government to function as the instrument of the new totalitarian principles. It consisted of an Executive Council to "convey the will and ideas of those who govern to those who are governed," and a Central Cooperative Council, to "convey the will and ideas of those who are governed to those who govern." Members of both Councils were appointed by the Premier, one-half of the appointees to the Central Cooperative Council being chosen from names submitted by prefectural branches of the Imperial Rule Assistance Association. Branches of the Association were formed

in every town and village, with all leaders appointed from above. In 1942 the Association entered candidates in the elections to the Diet and emerged as the organ of a one-party state (see *YEAR BOOK* for 1942, p. 347). A Supreme Economic Council and a Supreme Cultural Council were appointed in 1940 to supervise economic and cultural affairs.

The Government assumed most of the aspects of an open military dictatorship with the formation of the Tojo Ministry on Oct. 18, 1941. Japan signed the Anti-Comintern Pact with Germany Nov. 25, 1936, and adhered to the Italo-German military alliance Sept. 27, 1940. After signing a nonaggression pact with the U.S.S.R. on Apr. 13, 1941, Japan attacked the United States and the British Empire without warning on Dec. 7, 1941. Premier at the beginning of 1945: Gen. Kuniaki Koiso.

Events, 1945. Imperial Japan, the only oriental country which escaped occupation by the Mongolian conquerors, Genghis and Kublai Khan in the 12th and 13th centuries, and since that time had boasted of its invincibility, was forced to capitulate to the United Nations.

The reason the Japanese escaped occupation of their homeland at the hands of the Mongols 7 centuries ago, was due, not to superior military prowess, but to a disastrous typhoon which wrecked the great Mongol fleet in the Yellow Sea and the Sea of Japan. This led the Japanese to attribute their escape to supernatural causes, as evidenced in their use of the word "kamikaze" (meaning Divine Wind) for their suicide planes used against the American and British warships at Okinawa in the Ryukyu Islands.

Since the year 1944 was recorded in Japan as the "year of the B-29 Superfortress raids," bringing home to the Japanese people the inescapable fact that their country was vulnerable to external attack, it was inevitable that the year 1945 would go down in Japanese history as the "year of the atomic bomb and Japan's capitulation to the superior force and ingenuity of the United Nations."

Never before in Japan's 2,600 years of mythological and recorded history had there been so many calamitous happenings to the war-built empire in such a short period of time. Although Japan's war with China had been in progress for 8 years (14 years counting from Japan's seizure of Manchuria in 1931), and with the United Nations for 4 years, the main Japanese islands were still uninvaded and Japan's well-equipped army, ranging from 5 to 7 million men, was still undefeated.

Tragic Sequence of Events. Then began the tragic happenings, which, in the short space of a few weeks reduced the Japanese Empire from the status of a powerful world power with more than a half-billion people and untold wealth, to that of a nation, of little greater importance than when the country was opened to world trade and intercourse by Commodore Perry of the U.S. Navy in 1853. The tragic happenings of mid-summer, 1945, were in the following sequence:

July 26—Ultimatum to Japan to surrender or suffer complete destruction, issued by the United States, Great Britain and China (with the U.S.S.R. present) at the Potsdam Conference.

Aug. 6—Americans drop first atomic bomb, from B-29 Superfortress, on Hiroshima, important industrial city of Japan, causing almost complete destruction of the city with vast loss of life. (The second atomic bomb to be dropped struck Nagasaki, with equally serious consequence, on Aug. 9.)

Aug. 9—Russia decided to enter the war against

Japan, launching strong attacks against Manchuria, Karafuto (southern Sakhalin), Korea, the Kurile Islands, and Inner Mongolia.

Aug. 10—Japan offered to surrender in a broadcast issued through official *Domei* news agency, providing Allies would consent to retention of Emperor Hirohito.

Aug. 14—Japanese agree to accept surrender terms which, while consenting to retention of Hirohito, specified that the Emperor would be subject to the orders of the Allied Supreme Commander, Gen. Douglas MacArthur.

Aug. 28—(Tokyo Time) United States troops began landing in Japan.

Sept. 2—Japanese envoys signed official surrender documents aboard the U.S.S. *Missouri* in Tokyo Bay, 9:08 A.M. Tokyo Time (Sept. 1, 8:08 P.M. U.S. Eastern War Time).

Sept. 5—United States combat reconnaissance troops enter Tokyo as vanguard for the First Cavalry Division to occupy the Japanese capital and make preparations for the arrival of Gen. Douglas MacArthur.

Sept. 8—General MacArthur entered Tokyo.

Cabinet Resigns. The Japanese cabinet of Premier Kantaro Suzuki announced its resignation on September 16, "because of the new situation created by Japan's acceptance of the Potsdam Declaration which requires a new cabinet of men with fresh ideas." The Suzuki cabinet was succeeded on the following day by a new cabinet headed by Prince Naruhiko Higashi-kuni, a cousin of Emperor Hirohito and the first member of the Japanese imperial family ever to head a Tokyo cabinet. The full cabinet included the following names: Premier and War—Prince Naruhiko Higashi-kuni; Foreign Affairs and Greater East Asia—Mamoru Shigemitsu; Navy—Adm. Mitsumasa Yonai; Transport—Naoto Kohiyama; Information—Takatora Ogata; Munitions—Chikuei Nakajima; Finance—Juichi Tsushima; Justice—Dr. Chuzo Iwata; Agriculture and Commerce—Kotaro Sengoku; Chief of the Legislative Bureau—Naokai Murase; Home Minister—Iwao Yamazaki; Minister without Portfolio—Prince Fumimaro Konoye; Education and Welfare—Kenzo Matsumura. (Admiral Yonai, Transport Minister Kohiyama, and Information Minister Ogata were holdovers from the previous cabinet.)

In its report concerning the new cabinet, *Domei* stated that the Emperor had taken action "without consulting the senior statesmen, as on previous occasions." Since the new cabinet of Prince Higashi-kuni would have the unpopular duty of passing on to the Japanese people and enforcing the orders of the Supreme Allied Commander, Gen. Douglas MacArthur, its personnel was closely scanned in Allied quarters. The first member to arouse serious question was Information Minister Takatora Ogata (head of the Black Dragon Society) whose name appeared on the initial list of Japanese war criminals, and whose arrest was ordered by the supreme war commander. The cabinet secretary promptly announced that he had been dropped.

Obey the Emperor. Indicative of the tension prevailing in Japanese official quarters was a further *Domei* broadcast, combined with editorials in the Tokyo papers, warning the people to "obey all imperial rescripts," and particularly warning religious organizations to "comply with His Imperial Majesty's wishes concerning Japan's acceptance of the Allied peace terms." An editorial in the *Matrichi* said, "If Japan should go back on its word, by taking an evasive attitude in living up to the forthcoming peace terms dictated by the Allied powers, there will be no possibility whatever for Japan to

rise to her feet again." *Domei* also issued a broadcast directed to Japanese nationals throughout the Orient summoning them "to work for the innate glory of our imperial state," and "to devote themselves to the advancement of scientific knowledge, since it was the superiority of enemy science that defeated Japan. . . . We must plan to build up quickly our production in order to rebuild a new Japan."

The editorial department of Tokyo Radio, headed by Kusuo Oya, broadcast a declaration, "We lost the war, but we did not lose the war spiritually. We are still fighting for the independence of the Far East. . . . Our ideals are not wrong in that."

The U.S. State Department in Washington in noting the personnel of the new Prince Higashi-kuni cabinet, called attention to the fact that Prince Higashi-kuni the Japanese Premier had been in office as Chief of Home Defense at the time of the Doolittle air raid (Apr. 18, 1942) and had declared at the time that the crews of the American planes who had been captured in Japanese-occupied territory, "would be court-martialed and severely punished or executed if their attacks were inhuman, that is directed at civilians, causing them to suffer."

Blamed Atomic Bomb. Emperor Hirohito, as well as former Premier Suzuki, placed the Government's official stamp of approval on a declaration, issued just before Suzuki's resignation, claiming that the cause of Japan's defeat was the Atomic Bomb. The declaration said, "The Imperial judgment has already been passed. The way for His Majesty's subjects to follow is self-evident. Japan will face in future further difficulties and hardships which will demand greater endurance on the part of the people. . . . there was no way for Japan to realize her objective in the war. . . . With the use of the new bomb, which has destructive power unprecedented in history, science has brought a change in the method of warfare. . . . Moreover, the Soviet Union on August 9 declared war on Japan and Japan has come to face an unprecedentedly difficult situation. . . . Japan must develop its fortunes in future through its endurance. . . . the way for the people to proceed is in guarding our national policy. . . ."

Staggering Losses. Premier Prince Higashi-kuni, told an extraordinary session of the Diet on Sept. 5, 1945, some further and probably the decisive reasons for Japan's defeat. He said, "Our material fighting resources in the last days of the war were grievously deteriorating. On the other hand, the capacity for supply and replenishment on the part of the Allied nations, with their vast resources and industrial power, was ever on the increase. . . . By May, 1945, Japan's shipping bottoms had dwindled to about one-fourth of what Japan had possessed at the start of the war, and the lack of fuel was causing further shipping difficulties. Rail transportation had steadily become poorer because of Allied air attacks and the depreciation of rolling stock, and after the middle of the current year (1945) was reduced to less than one-half that of 1944. This affected the supply of coal and made importation difficult. . . . Finally the country's production dwindled to such a point that any swift restoration of it came to be considered beyond hope. . . . Steel production was less than one-fourth of the prewar total, coal could not be transported, materials were lacking for the chemical industry and it appeared by the middle of this year that the supply of explosives would be impeded. . . . The lack of foodstuffs was seriously felt by the people as were the gradually growing effects of inflation."

The Premier concluded his address to the Diet with a graphic description of the Allied air assaults on Japan proper, "which were steadily intensified and small, medium and great cities were gradually destroyed in rapid succession with calamitous consequences. . . . Then in August the Allied forces started to use the Atomic Bomb. . . . The ruins of Hiroshima and Nagasaki, which were subjected to attack by this weapon, are indeed too ghastly to look upon. . . . This terrific weapon was likely to result in obliteration of the Japanese people and lead to the total extinction of human civilization. . . . Furthermore the Soviet Union suddenly declared war on Japan, forcing us into the worst international situation. . . ."

Tried Separate Deal with the U.S.S.R. The Japanese government then disclosed officially the information already widely rumored, that the Japanese government had begun negotiations as far back as June, 1945, with the Soviet Union for "conclusion of a treaty of amity and friendship and certain other matters," thus hoping to bring about an early end of the war. According to the Tokyo Radio, a reply to these overtures, "was being awaited, when the Potsdam ultimatum was issued on July 26; thus Japan's surrender was delayed, pending a reply from the Russians." The Soviet Government announced on August 8 that it had communicated to Naotake Sato, Japanese Ambassador in Moscow that Japan's peace proposal "had lost its ground since Japan had repudiated the Potsdam Declaration and that the Soviet Union would enter into a state of war with Japan as from August 9."

Finally (not mentioned in the Premier's address to the Diet), was the knowledge possessed by Japan's military leaders that the Allies were massing the greatest force of sea, land, and air forces ever assembled in world history for a combined attack on Japan's positions both in Japan proper and on the continent of Asia. Also, unmentioned in the Premier's address was the fact fully realized by the Japanese Army that reorganized and freshly-trained, armed and equipped Chinese forces had already begun a general attack on Japan's positions in central China, particularly along the north-south "corridor" which the Japanese Army had established for the double purpose of paralyzing Chinese resistance, and maintaining communications between their far-flung military positions extending from Manchuria, through China to Indo-China, Malaya and Burma.

Suffered Most From B-29's. Information concerning the vast destruction wrought in Japan upon cities and industrial establishments, prior to the dropping of the Atomic Bombs, was provided in reports from advanced American aviation headquarters at Guam and elsewhere in the Pacific. Gen. Carl A. Spaatz, commanding general of the U.S. Army Strategic Air Forces, reported on August 17 that Superfortresses operating from the Marianas, India, and China, flew 32,612 sorties against the Japanese and dropped 169,420 tons of bombs in the 14 months they were operating. The B-29's destroyed the major portion of the industrial productive capacity of 59 Japanese cities, laid 12,049 mines in enemy waters and destroyed or damaged 2,285 Japanese planes. In carrying out these missions the Americans lost 437 Superforts, each carrying 11 men, of which number those from 297 bombers were not rescued. Some 600 airmen from downed B-29's were saved.

Further items in General Spaatz's report were as follows: incendiary attacks burned out 157.98 square miles of Japanese urban industrial areas and left homeless or dead an estimated 8,480,000

persons. Tokyo was ravaged in 6 low-level fire-bombing attacks, leaving in ashes 50.8 square miles. Sixty-one industrial plants in the Tokyo area were attacked and many completely wiped out.

Japanese Casualties from Air Attacks. A Japanese broadcast on August 24 claimed that Allied air attacks on the Japanese home islands had killed 280,000, injured 420,000 and had "almost completely" wiped out the people of 44 cities. The Japanese broadcast claimed that 9,200,000 people were homeless, which combined with those affected outside the home islands, made a grand total of 10,000,000 or one-sixth of Japan's home population. Out of 206 cities of Japan, 44 were almost entirely wiped out and 37 others lost 30 percent of their built-up area. Japanese broadcasts claimed that 2,210,000 Japanese homes were destroyed and 90,000 were damaged.

Documents in the Case. The following are summaries of the various documents, concerned with Japan's capitulation. They are presented in chronological order:

CAIRO DECLARATION

Dec. 1, 1943—The American, British and Chinese governments . . . have agreed upon future military operations against Japan. The three great Allies are resolved to bring unrelenting pressure against their brutal enemies by sea, land and air. The three great Allies are fighting to restrain and punish the aggression of Japan. They covet no gain for themselves and have no thought of territorial expansion. It is their purpose.

(1) That Japan be stripped of all the islands in the Pacific which she has seized or occupied since the beginning of the first World War in 1914, and that all the territories Japan has stolen from the Chinese, such as Manchuria, Formosa and the Pescadores, shall be restored to the Republic of China.

(2) Japan also will be expelled from all other territories which she has taken by violence and greed.

(3) The aforesaid three great powers, mindful of the enslavement of the people of Korea, are determined that in due course, Korea shall become free and independent.

(4) With these objects in view, the three Allies, in harmony with those of the United Nations at war with Japan, will continue to persevere in the serious and prolonged operations necessary to procure the unconditional surrender of Japan.

POTSDAM DECLARATION

July 26, 1945—American-British-Chinese declaration, issued at Potsdam, calling on Japan to surrender:

President of the United States, President of China and Prime Minister of Great Britain have conferred and agreed that Japan shall be given an opportunity to end this war. The prodigious land, sea and air forces of the United States, British Empire and China are poised to strike the final blows upon Japan. The Allied nations are determined to prosecute the war against Japan until she ceases to resist. The result of the futile and senseless resistance of Germany stands in awful clarity as an example to the people of Japan. The might now converging on Japan is immeasurably greater than that which applied to the resisting Nazis laid waste to the land, industry and methods of life of the whole German people. The full application of our military power, backed by our resolve, will mean the inevitable destruction of the Japanese armed forces and utter destruction of the Japanese homeland. Time has come for Japan to decide whether she will continue under the control of self-willed militaristic advisers whose unintelligent calculations have brought the Empire of Japan to the threshold of annihilation, or whether Japan will follow the path of reason. The following are our terms:

(1) There must be eliminated for all time the influence of those who have deceived and misled the people of Japan into embarking on world conquest. We insist that a new order of peace, security and justice, will be impossible until irresponsible militarism is driven from the world.

(2) Until such a new order is established and until there is convincing proof that Japan's war-making power is destroyed, points in Japanese territory to be designated by the Allies shall be occupied to secure achievement of the basic objectives we are her setting forth.

(3) The terms of the Cairo Declaration shall be carried out and Japanese sovereignty shall be limited to the islands of Honshu, Hokkaido, Kyushu, Shikoku and such smaller islands as we designate.

(4) Japanese military forces, after being completely disarmed, shall be permitted to return to their homes with the opportunity to lead peaceful and productive lives.

(5) We do not intend that the Japanese shall be enslaved as a race, or destroyed as a nation, but stern justice shall be meted out to all war criminals, including those who have visited cruelties upon our prisoners. The Japanese government shall remove all obstacles to revival and strengthening of democratic tendencies among the Japanese people. Freedom of speech, religion and of thought, as well as respect for the fundamental human rights shall be established.

(6) Japan shall be permitted to maintain such industries as will sustain her economy and permit the exaction of just reparations in kind, but not those industries which will enable her to rearm for war. To this end, access to, as distinguished from control of, raw materials shall be permitted. Eventual Japanese participation in world trade relations shall be permitted.

(7) The occupying forces of the Allies shall be withdrawn from Japan as soon as these objectives have been accomplished and there has been established in accordance with the freely expressed will of the Japanese people, a peacefully inclined and responsible government.

(8) We call upon the government of Japan to proclaim now the unconditional surrender of all Japanese armed forces, and to provide proper and adequate assurances of their good faith in such action. The alternative for Japan is prompt and utter destruction.

JAPAN'S SURRENDER OFFER

August 10—The Japanese issued a proposal of surrender to the governments of the United States, Great Britain, China and the Soviet Union. (The Soviet Union declared war on Japan on the preceding day, that is, August 9). The Japanese surrender proposal was as follows:

In obedience to the gracious command of His Majesty, the Emperor who, ever anxious to enhance the cause of world peace, desires earnestly to bring about a speedy termination of hostilities with a view to saving mankind from the calamities imposed upon them by further continuance of the war, the Japanese government several weeks ago asked the Soviet government, with which neutral relations then prevailed, to render good offices in restoring peace vis-à-vis the enemy powers. Unfortunately, these efforts in the interest of peace having failed, the Japanese government in conformity with the august wish of His Majesty to restore the general peace, and desiring to put an end to the untold sufferings entailed by war as quickly as possible, have decided upon the following:

(1) The Japanese Government are ready to accept the terms enumerated in the joint declaration which was issued at Potsdam on July 26, 1945, by the heads of the governments of the United States, Great Britain and China, and later subscribed by the Soviet government, with the understanding that the said declaration does not comprise any demand which prejudices the prerogatives of His Majesty as a sovereign ruler.

(2) The Japanese government sincerely hope that this understanding is warranted and desire keenly that an explicit indication to that effect will be speedily forthcoming.

THE ALLIES' REPLY

August 11—With regard to the Japanese government's message accepting the terms of the Potsdam Declaration but containing the statement "with the understanding that the said declaration does not comprise any demand which prejudices the prerogatives of His Majesty as a sovereign ruler," our position is as follows:

(1) From the moment of surrender the authority of the Emperor and the Japanese government to rule the state shall be subject to the Supreme Commander of the Allied Powers, who will take such steps as he deems proper to effectuate the surrender terms.

(2) The Emperor will be required to authorize and insure the signature by the government of Japan and the Japanese Imperial Headquarters of the surrender terms necessary to carry out the provisions of the Potsdam Declaration, and shall issue his commands to all the Japanese military, naval and air authorities and to all the forces under their control wherever located, to cease active operations and to surrender their arms, and to issue such other orders as the Supreme Commander may require to give effect to the surrender terms.

(3) Immediately upon the surrender the Japanese government shall transport prisoners of war and civilian internees to places of safety, as directed, where they can quickly be placed aboard Allied transports.

(4) The ultimate form of government of Japan shall, in accordance with the Potsdam Declaration, be established by the freely expressed will of the Japanese people.

(5) The armed forces of the Allied Powers will remain in Japan until the purposes set forth in the Potsdam Declaration are achieved.

JAPAN'S SURRENDER MESSAGE

August 14—Communication of the Japanese government addressed to the governments of the United States, Great Britain, Soviet Union and China. With reference to the Japanese government's note of August 10, regarding

their acceptance of the provisions of the Potsdam Declaration and the reply of the governments of the United States, Great Britain, the Soviet Union and China, sent by American Secretary of State Byrnes under the date of August 11, the Japanese government have the honor to communicate to the governments of the Four Powers as follows:

- (1) His Majesty the Emperor has issued an imperial rescript regarding Japan's acceptance of the provisions of the Potsdam Declaration.
- (2) His Majesty the Emperor is prepared to authorize and insure the signature by his government and the Imperial General Headquarters of the necessary terms for carrying out the provisions of the Potsdam Declaration. His Majesty is also prepared to issue his commands to all the military, naval and air authorities of Japan and all the forces under their control, wherever located, to cease operations, to surrender arms and to issue such other orders as may be required by the Supreme Commander of the Allied Forces for the execution of the above-mentioned terms.

INSTRUCTIONS FOR JAPAN'S SURRENDER

August 14—Instructions for formal Japanese surrender transmitted on behalf of the Allied nations by United States Secretary of State Byrnes.

With reference to the communication of today's date transmitting the reply of the Japanese government to my communication of August 11, which I sent on behalf of the governments of the United States, China, the United Kingdom and the Union of Soviet Socialist Republics, which I regard as full acceptance of the Potsdam Declaration, and of my statement of August 11, 1945, I have the honor to inform you that the President of the United States directed that the following message be transmitted to the Japanese government.

- (1) You are to proceed as follows: Direct prompt cessation of hostilities by Japanese forces, informing the Supreme Commander for the Allied Forces of the effective date and hour of such cessation.
- (2) Send emissaries at once to the Supreme Commander for the Allied Powers with information of the disposition of the Japanese forces and commanders, and fully empowered to make any arrangements directed by the Supreme Commander for the Allied Powers to enable him and his accompanying forces to arrive at the place designated by him to receive the formal surrender.
- (3) For the purpose of receiving such surrender and the carrying of it into effect, General of the Army Douglas MacArthur has been designated as the Supreme Commander for the Allied Powers, and he will notify the Japanese government of the time, place and other details of the formal surrender.

OFFICIAL ANNOUNCEMENT

August 14—President Truman's Statement.

I have received this afternoon a message from the Japanese government in reply to the message forwarded to that government by the Secretary of State on August 11. I deem this reply a full acceptance of the Potsdam Declaration, which specifies the unconditional surrender of Japan. In the reply there is no qualification. . . . Arrangements are now being made for the formal surrender terms at the earliest possible moment. . . . General Douglas MacArthur has been appointed Supreme Allied Commander to receive the Japanese surrender. . . . Great Britain, Russia and China will be represented by high ranking officers. . . . Meanwhile the Allied armed forces have been ordered to suspend offensive action. . . . The proclamation of V-J Day must wait upon the formal signing of the surrender terms by Japan.

Japan Now Fourth-Rate Nation. General MacArthur, Commander-in-Chief of Allied Forces in the Pacific, declared on Sept. 11, following the landing of American forces at Yokohama, that Japan has now been reduced to a "Fourth-rate State." He said that in reports concerning Japan's capitulation, the fact had been overlooked that Japan's army also had been defeated in addition to the country's navy and air establishments. He said that Japan's army, which had long ago convinced the Japanese people of its invincibility, would now be broken up and returned to civil life with a record of defeat. He emphasized that American and Allied responsibilities, aside from the release and repatriation of war prisoners, would be to land and disperse strategically throughout the Japanese archipelago, sufficient occupation troops to secure utmost security against any possible outbreak of violence; and to guarantee the complete disarmament, demobilization and return to their homes of all Japanese mili-

tary personnel from general and admiral to the lowest grade soldier and sailor.

Imperial Staff Broken Up. The most effective measures, looking to the break up of Japan's military establishment and the destruction of the prestige which has surrounded military life in Japan from earliest times were set in motion on September 10 when General MacArthur ordered Emperor Hirohito to abolish the Japanese Imperial General Headquarters. The order became effective as soon as there were sufficient American forces ashore to guarantee against resistance by Japanese remnants not yet disarmed. The Imperial General Headquarters, including both Army and Navy, had been responsible for the Russo-Japanese War of 1904-05, territorial expansion in the Pacific in World War I and the initiation of the conflict in Manchuria in 1931. The order amounted to the lopping off of the head of Japan's vast military establishment, which included a minimum of 6,000,000 troops stretching from Hokkaido, the most northern Japanese island, to Singapore, Netherlands East Indies, and the Solomon Islands in the tropics; and also the remnants of Japan's fleet personnel, and finally the dismantling of innumerable bases, barracks, fortified zones, forts and other military establishments throughout Japan's far-flung oriental empire.

The total number of American and Allied troops required for the occupation of Japan was estimated at 400,000 to 500,000. Approximately 150,000 men were used in the initial occupying force, which took up positions in 10 major Japanese ports and naval bases, but it was announced that 10 additional divisions were scheduled for landing within the first six weeks. A later statement by General MacArthur that Japan could be policed by 200,000 regular troops, was questioned by the U.S. State Department in Washington.

Japanese Atrocities. The U.S. State Department on September 5 made public a detailed documented report concerning Japan's mistreatment of American and Allied military and civilian prisoners. The report, which occupied two full pages in the *New York Times* of September 6, told of repeated attempts to induce the Japanese to consent to visits to American and Allied prison camps in Japan on the part of officials of the neutral (Swiss) International Red Cross. With few exceptions these attempts were refused by the Japanese military officials; the Japanese also refusing to supply the names of prisoners held. Of large sums of money transmitted from the United States to prisoners for purchase of clothing and food, little ever reached its destination, stated the report. The U.S. State Department also repeatedly protested breaches on the part of Japan of the Geneva Convention, concerning treatment of prisoners of war and civilian internees. The most serious violation, according to the report, was the location of prison camps in the vicinity of war objectives, resulting in some cases, of Allied prisoners being killed during American bombing raids.

The report contained texts of official protests containing the signatures of Secretaries Hull and Stettinius and Assistant Secretary Grew of the U.S. State Department, which had been forwarded to the Japanese authorities (through the Swiss Government) concerning a long category of atrocities, including the decapitation of airmen and the murder of other Americans; prisoners being forced to work in Japanese war plants; prisoners being machine-gunned in the sea, following the sinking of torpedoed ships upon which they were being transported to Japan; of innumerable cases of torture and inhuman treatment at the hands of the Jap-

anese gendarmerie; of starvation diets provided in camps when food and medicines supplied by the American Red Cross were available. The U.S. State Department charged that the practice of the Japanese in locating prisoners' camps near legitimate bombing objectives was "both persistent and methodical," the Japanese object being to protect certain plants from bombardment. Stated the report, "We are forced to draw the conclusion from the continued practice of the Japanese Government in locating prisoner-of-war camps in close proximity to docks, warehouses, war factories, railroad yards and other military objectives that the Japanese Government was carrying out a deliberate policy of attempting to render certain points or areas immune from bombardment by the presence of prisoners of war in such areas." The report cited several specific instances at Shanghai and elsewhere where such situations prevailed.

The U.S. State Department announced that the Swiss Government had been authorized to represent Japanese interests in the United States and in consequence was permitted to visit all camps in the United States where Japanese were held. The ill-treatment, starvation and torture of prisoners extended throughout the territories under Japanese occupation from Manchuria and Korea—where many Americans were held—to Siam and Malaya—where tens of thousands of Britons, Dutch and other occidentals, including a smaller number of Americans were held and forced to work in disease-infested jungles and swamps, with little or no medical attention available.

The following reports of atrocities appeared in the newspapers in the period from January 1 to mid-September when most of the Allied prisoners had been released. Five American fliers, shot down over Borneo, were executed by the Japanese on January 13. Large numbers of wounded prisoners on Wake Island were bayoneted following surrender. Of 644 survivors of the American cruiser *Houston*, torpedoed in the battle of the Java Sea (total personnel 1,012), 368 managed to reach the beaches of the island of Java where they were captured by the Japanese. Of these 220 were sent to Burma, where 69 died, along with 62 other Americans and some 20,000 Britons while laboring in the steaming sun in the construction of the Burma-Thailand Railroad. The remainder of those rescued from the *Houston*, were sent to Japan to labor as technicians.

American children in Japanese concentration camps were denied shoes and clothing in sub-zero weather. Japanese guards tossed grenades into the hold of a sinking ship off the Philippines which contained 750 American prisoners. The Japanese made a huge bonfire out of an air-raid shelter filled with 150 prisoners and then buried the survivors alive. Survivors of forced labor gangs composed of American, British and Australian war prisoners on the Burma-Thailand Railway stated that the prisoners called it the "railway of death" because every tie laid beneath the tracks cost the life of an Allied war prisoner. According to a report by Australian survivors, one railway bridge at the Thailand end of the railway, cost 600 men. When the men dropped from disease and fatigue, the Japanese guards tossed them over a cliff. Prisoners suffered from malaria, dengue fever, and tropical ulcers, but no medicines were available. Articles of clothing and jewelry belonging to the prisoners were exchanged for food. Thirty men were killed during an Allied air raid on a camp in Burma where Allied prisoners were deliberately housed adjoining an ammunition dump.

Seriously ailing prisoners in a hospital at Shima-

gawa, Japan, were used by the Japanese doctors as human "guinea pigs" in fantastic experiments recalling the sorcery and sadism of the Middle Ages. An American bomber-pilot at Shanghai was hung by his thumbs for twenty minutes and seven other Army and Navy pilots were severely beaten by the Japanese guards in an effort to force them to disclose American plans for the invasion of the Japanese homeland. A report from the Netherlands East Indies stated that at least 50,000 Allied prisoners, chiefly Dutchmen, but also including many Britons and some Americans, died in prison camps in the Netherlands East Indies. Allied Headquarters in Manila reported on August 18 that a grand total of 155,000 Americans, Britons, and Dutchmen had been held throughout most of the war by the Japanese in more than 100 camps and prisons in the Japanese homeland and on the continent of Asia. Approximately 7,000 Americans were held in eight camps scattered about Shanghai, some in close proximity to military objectives.

The number of prisoners held in the Japanese home islands was estimated at approximately 32,500. About 200 high-ranking officers and some 1,200 American enlisted men were held in a camp near Mukden, Manchuria. A Red Cross report stated that the Japanese originally interned, after Pearl Harbor, some 200,000 Allied troops and civilians, exclusive of native troops in the various Asiatic countries which the Japanese occupied. Deaths in camps and on torpedoed ships, up to April, 1945, numbered in excess of 50,000, mostly prisoners of war. The number held at the time of the Japanese surrender was estimated at 75,000 to 85,000 prisoners of war and 60,000 to 70,000 civilian internees. These prisoners were held in camps in Japan proper, Korea, Manchuria, Shanghai, Peiping, Hong Kong, Canton, Indochina, Siam, Malaya, and Netherlands East Indies.

A report from Manila placed the total number of prisoners at 140,000, of which 100,000 were British, 33,000 Americans, and the remainder Dutch. Heading the list was Lieut. Gen. Jonathan M. Wainwright, who was held first in Formosa, then taken to Manchuria, and finally liberated in mid-August. Another widely known prisoner, Lieut. Col. James P. Devereux, former commander of Wake Island, was found in a secret camp in Hokkaido, Japan. Julius Ochs Adler, special correspondent for the *New York Times*, who investigated Nazi concentration camps in Europe, expressed the opinion that Japanese treatment of American soldiers, airmen, sailors, and marines was in many instances as horrible and atrocious as that meted out by the Germans to inmates of Nazi camps.

Comm. Harold L. Stassen, flag secretary to Admiral Halsey, described a central Japanese "inquisition" camp where Allied prisoners were starved and tortured systematically. Most of the prisoners in the inquisition camp were submarine men and fliers. The prisoners were told by their Japanese guards that the Red Cross would not be notified of their capture and they would be considered "dead or missing," hence there would be no record of them. The prisoners, according to Commander Stassen, were taken to the camp blindfolded and placed in groups of fifteen in cells, 8 ft. by 10 ft., while some were placed in solitary confinement. All were tortured and starved in an effort to extort information from them. There were no sanitary facilities and the men were forced to live in filth, and while being interrogated by officers, were subjected to kicks, slaps, lashings and variations of the thumb-screws of medieval times, crushing

the fingers or jabbing matches under fingernails.

Many died under the torture. Some 1,000 men from this camp were released in a badly emaciated condition on August 31. Every one was suffering from malnutrition and many had lacerated hands and fingers showing results of torture. An American physician, Dr. Gottfried, imprisoned with the men, was prevented from practicing his profession and forced to work in the camp with a pick and shovel. Dysentery was prevalent and more than 5,000 of the men liberated immediately after the Japanese capitulation, were in dire need of hospital treatment. Ninety-five American airmen and eight Englishmen, mostly from carrier planes, were found in an unregistered torture camp near Yokohama.

Economic Control of Japan. Gen. Douglas MacArthur announced on September 19 the organization of an economic and scientific section, under the direction of Col. Raymond C. Kramer, which was designed to "look into every nook and cranny" of Japanese business and science and to make recommendations for the control thereof. The creation of the new department marked the first step on the part of the Allies to obtain definite information concerning the economic, industrial, financial, mining and scientific resources and services of Japan and Korea for the purpose of formulating Allied policies looking toward the conversion of Japan's over-expanded war industries to peacetime and peaceful production. It was stated that the job of Colonel Kramer would be to make recommendations for the dismantling of industrial enterprises, removal or transfer of machinery and non-military records, recommend basic changes in the character of products, transfer of money, bullion or securities into or out of Japan.

The announcement of the creation of the new department followed, and may have been intended, to circumvent an attempt on the part of Premier Gen. Prince Naruhiko Higashi-kuni and his Japanese supporters to obtain "substantial credits and economic assistance from abroad for use in the reconstruction of Japan." General MacArthur's headquarters reported that Japan, as a defeated nation, would be required, first, to pay the costs of occupation, and eventually, reparations for damages. It was therefore pointed out that Japan was in no position to ask for financial assistance. It was pointed out that Japan was already paying the costs of occupation because the salaries of all officers and enlisted men were being paid in Japanese yen obtained from the Bank of Japan or printed by the Allies as military currency. The circulation of foreign currency in Japan was forbidden by the Allied command. The Japanese authorities were also compelled to provide housing for the Allied headquarters staff at Japanese expense.

Further lines of activity of the Economic and Scientific Section, included supervision over exports and imports, use of transportation and public utilities, conversion of available facilities to civilian use, coordination of the activities of scientific and economic missions from the United States and other nations. It also was expected to prepare inventories of economic and scientific resources of Japan, including an investigation of patents and cartel agreements between Japan and other countries, and was authorized to make recommendations concerning distribution of civilian goods and price stabilization.

In a further statement on the same subject by Dean Acheson, Acting U.S. Secretary of State, issued following General MacArthur's announcement, it was declared that Japan "will be put in a

position where it cannot renew aggressive warfare; that the present economic and social system in Japan which makes for war, will not be permitted to continue, and whatever it takes to carry out this policy will be used to carry it out." The U.S. State Department's declaration was interpreted as a forecast of revolutionary changes in the economic and social structure of Japan which centered around breaking down the economic power of the great families which dominated Japanese economic life.

Other measures designed to establish, more securely, Allied control of Japanese affairs, included:

- (1) Dissolution of the Great Japan Political Society, totalitarian political association, inaugurated on March 30, 1944, ostensibly for the purpose of uniting all political opinions and the creation of harmonious relations between the cabinet of Premier Koiso and the people. The Great Japan Political Society succeeded the Imperial Rule Assistance Society, which had served as Japan's sole political party since 1941. In addition to the foregoing action, the House of Representatives of the Diet formed a committee to take over the functions previously exercised by the totalitarian parties.
- (2) Japanese War Office ordered to form a committee to investigate atrocities and maltreatment of Allied prisoners.
- (3) Japanese government issued Imperial Decree whereby all measures taken by the government at the request of the Allied Supreme Commander, automatically become legal.
- (4) Approved a plan to manufacture and encourage sale of all-wave radios, in order to permit the Japanese people to hear foreign broadcasts. Previously all radios in Japan were tuned to the official Japanese stations only.
- (5) Instructed Gen. Kenji Doihara to cooperate with the U.S. Eighth Army Headquarters in facilitating the American occupation of Japan. Gen. Doihara succeeded Field Marshal Gen. Sugiyama, who committed suicide.

Desperate Economic Situation. A report in the *New York Herald Tribune*, from its correspondent, Homer Bigart, with the occupation forces in Tokyo on September 12 quoted a number of leading Japanese executives concerning the desperate economic situation prevailing in Japan at the time of the capitulation. Ryozo Asano, important figure in the Japanese steel industry, said that the leading Japanese businessmen never thought Japan could defeat the United States and were appalled at the Japanese attack on Pearl Harbor, but they couldn't say anything, "because we feared the military would clap us in jail; we were afraid of death." Asano said that many small business men had been jailed because of their defeatist attitude. He declared, "Even in June when the rapid disintegration of Japan's industry produced almost complete paralysis of war production, we were unable to obtain the Emperor's ear." "We were badly beaten, our communications were crippled, but we couldn't do anything about it," he said.

Miyasaki, head of the powerful Mitsui interests, said the greatest single factor in the industrial collapse, was the inability to repair broken down machinery. Lack of spare parts paralyzed railroads, automobiles, trucks, street cars, and the telephone system. Thousands of workers, who fled from the cities because of the B-29 air raids, were lost to the industries because there was no means of communication and transportation between the factories and the countryside. According to Miyasaki, Japanese steel production, best barometer of the country's industrial capacity, fell from a peak of 4,500,000 tons in 1942 to less than 500,000 tons for the present year. Only 253,000 tons were produced in April, May and June, first quarter of the fiscal year. Fujiyama, head of the Japanese Chambers of Commerce, said that the Allied blockade had cut off coal and iron imports from North China

and this paralyzed the steel industry. Japan was forced to depend on inferior Japanese coal and on 42 percent iron ore. Then, said Fujiyama, our railroads broke down. The people ran away to the country and the workers never came back.

Terai, president of the Nippon Yusen Kaisha, revealed the amazing decline in Japanese ship construction. He said that shipbuilding had declined from 1,583,000 tons last year to 163,000 tons in the period from April to July this year, and in the closing month before the end of the war shipbuilding was at a standstill. Ship losses, due to American submarine action, bombers, and mines, had risen from 328,500 tons last year, to 798,000 tons in April, May and June this year, or almost five times current production. He said that mines sowed in Japanese harbors and sea lanes had sunk twice as many ships as bombers and twelve times as many as the submarines sank. He said that the scarcity of bauxite had paralyzed the aluminum industry, making it necessary to build airplanes from plywood.

All of the industrialists severely criticized Japanese army mobilization, which stripped the shops of skilled workers. Serious political unrest was expected as a result of widespread unemployment. Asano, president of the Japan Steel Tube Company, predicted 8,000,000 unemployed and declared that if food could not be imported at least 7,000,000 would starve in the coming winter. He said that practically all workers are on half-ration, due to shortage of rice; that the rice crop this year would amount to only 10,000,000 tons as compared to 13,000,000 tons last year. This year there will be no imports from Korea or Manchuria. Production of farm implements and fertilizers had dropped to one-quarter of normal. He said there was great uncertainty among the industrialists, because there had been prior to mid-September no instructions concerning future production from the Allied Headquarters.

That Japanese leaders were long aware of the critical economic situation, but had decreed to continue the war in the face of it, was indicated in a report from Washington (Federal Communications Commission) which stated that the Japanese had ordered a two-months state of emergency for the railroads in order to speed distribution of food and military supplies. As a result of American air assaults, the railways had been placed under military control in order to effect repairs and break freight jams. All civilian railway workers had been formed into "combat corps" to meet the desperate situation of the Japanese homeland being turned into a battlefield. . . . Private property rights in devastated cities were cancelled in order that the rubble could be cleared away and the land converted to food production. Orders were issued directing that devastated areas in 35 cities be planted with sweet potatoes, which could be used for food and as a source of supply for gasoline substitute. The cabinet spokesman hinted at a "hitherto untried material" which would be developed for food purposes.

Japan's Textile Industry. A report in the New York Times, from its correspondent in Tokyo (September 10) stated that serious anxiety prevailed concerning the Japanese clothing situation. The Japanese textile industry, particularly cheap cotton cloth, which dominated the Far East prior to the war, and was the largest customer for American raw cotton, is practically non-existent today. This is due, according to the correspondent, to two causes: American bombings and the fact that it was swallowed up in the production of war ma-

terials. A further cause, of which the correspondent apparently was not aware, was that the Japanese cotton industrialists, for nearly two decades had been following a program of decentralizing their industry by establishing cotton mills on the Asiatic continent—at Shanghai, Tsingtao, Tientsin, in Korea, and Manchuria—where cheap native labor and supplies of cheap cotton were available. These mills on the continent will now, in all probability, be taken over by the industrial leaders of the countries where the mills are located.

Japan's Economy at Rock Bottom. The correspondent of the New York Times in Japan, George E. Jones, reported during September that it would be necessary for Japan to "start the task of feeding, clothing and housing her people from rock bottom, and that only in the indefinite future would Japan be able to turn to the long-range work of reconstructing an industrial economy that was once one of the world's most powerful." Referring to current conditions, Mr. Jones stated that thousands of demobilized Japanese soldiers flood the railway stations and war-workers are streaming home from the cities. He said that most conservative estimates placed Japan's unemployed at 10,000,000. There are no industries, and there are no raw materials to build up light industries and there is no shipping even to bring home all overseas servicemen within less than two or three years. The number of Japanese servicemen and civilians to be brought home ultimately—within two or three years—is estimated from 3,000,000 to 6,000,000. And when they return they will find, according to private estimates, that 2,210,000 of their dwellings were destroyed and 9,200,000 people made homeless. The Japanese Home Ministry estimated that Japan needed 5,000,000 houses and that 190,000,000 cubic feet of lumber would be required. In the meantime much of the population of Japan's devastated cities are living in "shanty-town" collections of scrap tin dwellings that have sprung up. They lack both sanitation and warmth.

Regarding the food situation, Mr. Jones said that there had been a 10 percent reduction in the food ration in July, cutting the individual food diet to 1,500 calories daily, or a third of the American standard. The food crisis would be aggravated as the millions of servicemen and civilians are returned from abroad, "where they have been living on the country." Generally the Japanese look toward next year with dread and there will undoubtedly have to be a dole system for the homeless and hungry. Farming has suffered severely due to the exodus of workers from the country to the war industries. At present the Japanese have on hand 900,000 tons of rice, wheat, and potatoes, which were imported from abroad, and they are said to have more than 9,000,000 tons carried over from 1943 and 1944. Next year, however, there will be a deficiency of 1,500,000 tons of staple goods. Cotton industrialists estimated that 820,000 bales of cotton would be required to give the Japanese people half of their peacetime cotton cloth consumption.

Japan's Naval Losses. Japan's once proud fleet and merchant marine were reduced to almost insignificant remnants as a result of the blasting they received from American air and undersea power. Adm. Chester M. Nimitz stated on August 21 that Japan's once-powerful navy consisting of 382 combat and auxiliary vessels had been reduced to a bare 55, most of which were unseaworthy. In addition Japan's merchant fleet, once dominant on the Pacific and third in world trade, has been reduced to a little more than 1,000,000 tons of small and

antiquated vessels. The figures, thought to be approximately accurate, had been supplied by the Japanese surrender envoys in Manila.

MacArthur's "Revolution." The following is a summary of the outstanding "directives" issued by General Douglas MacArthur up to the end of 1945:

- 1—Dissolution of the Imperial Army and Navy General Staffs.
- 2—Arrest and trial of war criminals ordered.
- 3—Abolition of secret semi-military "Black Dragon Society" and order for arrest of leaders as war criminals.
- 4—Abolition of military censorship and dissolution of the semi-official *Domei* news service, which had become an organ of the military. Order issued for formation of a new cooperative news distribution organization to be known as Kyodo or "Cooperative." Kyodo is prohibited from sending correspondents abroad, hence will depend upon foreign news agencies for world news. The Japanese newspapers were instructed to initiate "open discussions" on subjects the people were interested in, including the status of the emperor system and trial of war criminals.
- 5—Japanese schools were ordered purged of all elements regarded as responsible for "bringing war and suffering to the people." Order meant dismissal of all known militarists and ultra-nationalists from the school system. It meant the "screening" of some 400,000 teachers throughout the school system from the grades to the universities.
- 6—Japanese women given the vote.
- 7—Labor Unions were legalized.
- 8—Political prisoners, allegedly numbering a million persons, ordered released from various prisons.
- 9—Four great family monopolies ordered dissolved in order to aid Japanese economic development along democratic lines. Companies affected are: Mitsui, Mitsubishi, Sumitomo, Yasudo, Zaibatsu. The large families, a hang-over from feudalism, had interlocking directorates, thus controlling much of the business, industries, shipping and overseas trade of the Empire. The order for the dissolution of the large Japanese family monopolies had serious repercussions in the United States where many large American companies, chiefly in the electrical and machinery lines, had close relations, even interlocking stock interests in the Japanese concerns.
- 10—Japanese narcotic monopoly ordered dissolved and stocks confiscated.
- 11—Japan ordered to sever all diplomatic ties with other countries and withdraw all diplomats from abroad.
- 12—Japanese constitution ordered revised.
- 13—War "loot" valued at hundreds of millions of dollars seized. Included were stocks of gold and silver seized by the Japanese Army in other Asiatic countries.
- 14—Japanese secret or "thought police," ordered dissolved and all repressive laws ordered repealed.
- 15—Freedom of speech, political activities and religion proclaimed. Order involved discontinuance of Shinto or Emperor-worship as a state religion.
- 16—Fifty percent reduction of government personnel ordered. Total number of government personnel estimated at 300,000.
- 17—All monopolistic and feudalistic land holdings, a hold-over from feudalistic times ordered dissolved.

Hirohito's New Year's Rescript. Emperor Hirohito, in a New Year's (1946) Imperial Rescript, declared that his divinity—the ancient tradition taught in the schools of the throne descended from the sun goddess Amaterasu—"is a false conception" based on legends and myths. The rescript repudiating the divinity creed was regarded as one of the most devastating declarations since the arrival of Commodore Perry. According to observers in Tokyo the rescript will rank as one of the most important state papers in Japanese history.

Revision of School Books. General MacArthur issued an order at the end of the year for a complete revision of all Japanese school books teaching the "divinity" and racial "superiority" theories. The order will necessitate the destruction of tens of thousands of school books now used throughout the school system.

Far Eastern Commission and Allied Council for Japan. The role of Gen. Douglas MacArthur as sole representative of the Allied Chiefs of Staff in carrying out the terms of the Potsdam Declaration, was modified considerably as a result of the meeting of the Big Three in Moscow in the last week of December, 1945. According to the Moscow Com-

munique of December 27, there is to be created a Far Eastern Commission to include representatives of the Soviet Union, United Kingdom, United States of America, China, France, Netherlands, Canada, Australia, New Zealand, India, and the Philippine Commonwealth.

In addition the Big Three Foreign Ministers Conference in Moscow announced the formation of an Allied Council for Japan, which will have its headquarters in Tokyo under the Chairmanship of the Supreme Commander for the Allied Powers. The Allied Council will include the Supreme Commander, (who shall be Chairman and the United States member) and representation of the Soviet Union, the Republic of China, and the United Kingdom.

JOHN B. POWELL.

JAPANESE PACIFIC ISLANDS (Nanyo). The former German possessions in the Pacific, north of the Equator (130° to 175° E. and 0° to 22° N.), over which Japan was appointed mandatory in accordance with the terms of the Treaty of Versailles, 1919. The mandate comprised some 1,458 islands, islets, and reefs, extending over an area of 1,200 miles north to south and 2,500 miles west to east. There are three main groups: (1) MARIANA or LADRONE (14 islands), including Saipan, Tinian, Rota; (2) CAROLINE (577 islands), including Yap, Palau (Babeldaob), Koror, Truk, Ponape, Kusaie; (3) MARSHALL (60 islands), including Jaluit. Total area, 830 square miles. Some of the islands were conquered and occupied during 1944 by United States armed forces. In 1945, following the defeat of Japan, all the islands passed under the control of the Allies. Population (1940 census), 131,157 (72,540 males and 58,617 females).

Production and Trade. The main products were sugar, maize, coffee, phosphates, tapioca, bananas, breadfruits, copra, alcohol, vegetables, fish, forest products, and bauxite. Trade (1938): imports were valued at U.S.\$8,723,000 (rice, machinery, cloth, oil, wax, wood and wood manufactures, cigarettes, and alcohol were the chief items); exports were valued at U.S.\$13,350,000.

Government. Budget (1940): revenue U.S.\$2,564,182; expenditure U.S.\$2,540,228. Under Japanese rule, the administrative affairs of the mandate were managed by a governor who was subject to the direction of the Japanese Minister of Overseas Affairs. Headquarters of the Governor were in Koror, one of the Palau islands in the western Carolines. See WORLD WAR.

JARVIS ISLAND. A mid-Pacific island (0° 23' S. and 159° 54' W.), south of Hawaii; owned by the United States. The island lies in the path of the main steamship lanes and airways from Honolulu to New Zealand and Australia. In former years guano was produced from the island but it remained uninhabited for years until 1936 when the U.S. Dept. of the Interior set up an aerological station.

JEWISH WELFARE BOARD, National. Organized Apr. 9, 1917, the Board has a two-fold purpose. It is the National Association of Y.M.H.A.'s, Y.W.H.A.'s, and Jewish Community Centers in the United States and Canada. It also provides for the religious and welfare needs of men and women in the armed forces of the United States. The Board is composed of 288 constituent societies in the United States and Canada, which have 400,000 members. Ten regional organizations of Jewish Centers are affiliated in its work.

The Board serves the Jewish Center field and

deals with problems relating to administration, vocational guidance, education, cultural, and recreational activities, special Jewish cultural programs, community surveys and institutional studies, club leadership training, summer country and day camps, health and physical education, forums, concerts and lectures, and personnel placement; it maintains a field service in contact with its affiliated organizations. The Jewish Center Division of the Board cooperates closely with government and private agencies and brings materials and plans to the attention of constituent societies.

The National Jewish Welfare Board is one of six organizations of the United Service Organizations (q.v.). In this connection, its activities are conducted on a non-sectarian basis.

The Army and Navy Committee of the Board (Walter Rothschild, Chairman) services men and women of Jewish faith in the Army and Navy in relation to their religious and welfare needs. This committee is composed largely of representatives of the 38 national Jewish organizations which are affiliated with it. There are more than 630 local Army and Navy Committees in the United States as well as overseas, through which communities cooperate in providing welfare activities for men and women in the armed forces. The Committee on Army and Navy Religious Activities (Rev. Dr. David de Sola Pool, Chairman) selects and endorses rabbis to serve as chaplains in the Army and Navy and prepares the devotional literature distributed to Jewish personnel in the forces. Other committees in the Army and Navy Division include Personal Service and the Bureau of War Records. A National Veterans' Service Committee, in association with the Jewish War Veterans of the United States and other national bodies, serves the needs of hospitalized and able-bodied veterans. The Board is an accredited agency of the Veterans' Administration and has been serving veterans since World War I.

The Women's Division (Mrs. Alfred R. Bachrach, Chairman) coordinates the efforts of national and local women's groups in behalf of the program of service to men and women in uniform and civilian war efforts.

The officers of the Board are: Frank L. Weil, President; Mrs. Alfred R. Bachrach, Lt. Col. Lloyd W. Dinkelspiel, Irving Edison, Mrs. Walter E. Heller, Carl M. Loeb, Jr., Donald Oberdorfer, Walter Rothschild, and Mrs. Felix M. Warburg, Vice-Presidents; Max Wilner, Treasurer; Merwin R. Haskel, Assistant Treasurer; Joseph Rosenzweig, Secretary; Ralph K. Guinzburg, Assistant Secretary; and Louis Kraft, Executive Director.

The headquarters are at 145 East 32 Street, New York 16, New York.

JEWIS AND JUDAISM. With the coming of victory for the United Nations, the Jews of the world concluded one of the darkest periods in their long history. According to estimates, the total world population had fallen to under 10,000,000, due to the unprecedented extermination by the Nazis of over 6,000,000 European Jews. It appears at the close of 1945 that of a prewar population of six millions in continental Europe, outside the Soviet Union, only about 1,250,000 remain. At least 100,000 of them were still in "Displaced Persons" camps eight months after V-E Day.

The condition of these Jews was studied by Earl G. Harrison, American member of the Inter-Governmental Committee on Refugees, at the request of President Harry S. Truman in a letter dated June 22, 1945. Harrison reported that many

displaced Jews were living in crowded, unsanitary concentration camps, and suffering from malnutrition. "Most Jews," he wrote, "want to leave Germany and Austria as soon as possible. . . . They want to be evacuated. . . . Palestine, while clearly the choice of most, is not the only named place of possible emigration." Mr. Harrison urged that a plan, submitted by the Jewish Agency of Palestine to the British Government, be sponsored by President Truman, calling for the immediate issuance of 100,000 additional immigration certificates for Jews. For those who wished to return to their original homes, he urged special aid. He also pleaded that "the United States, should, under existing immigration laws, permit reasonable numbers of . . . persons to come here . . ."

President Truman acted upon Harrison's recommendations. First, he wrote to Gen. Eisenhower, ordering that living conditions in the Displaced Persons camps be improved. He also wrote to Prime Minister Clement R. Attlee of Great Britain requesting that action be taken by the British to admit 100,000 Jews to Palestine. On Oct. 18, the President announced that the British had rejected the proposal, and on the same day, Secretary of State Byrnes published a letter, written by the late President Roosevelt to King Ibn Saud, of Saudi Arabia, dated April 5, 1945, in which the late President assured Ibn Saud that "no decision (would) be taken with respect to the basic situation in that country (Palestine) without full consultation with both Arabs and Jews." Byrnes announced, at the same time, that the Truman administration would follow the Roosevelt policy. This announcement was intended, no doubt, to prepare the American public for the plan, announced Nov. 13, to set up a Joint Anglo-American Committee of Inquiry whose functions would be to: 1) examine conditions in Palestine bearing on the problem of Jewish immigration and settlement there; 2) estimate how many Jews want to migrate to Palestine or other countries outside Europe; 3) make recommendations for a temporary and permanent solution of the two foregoing problems; 4) recommend aid for the Jews in Europe, "by remedial action in the European countries in question" or by immigration to countries outside Europe. In the meantime, the British Foreign Secretary, Ernest Bevin, announced that 1,500 immigration certificates per month would be issued.

These decisions, following upon the Harrison report and President Truman's request for 100,000 certificates, were a severe blow to Zionists and Zionist sympathizers everywhere. Protests against the setting up of the Joint Commission were issued from many Jewish communities, but in Palestine, even before Nov. 13, the Jews had been preparing to take action against the White Paper. (The White Paper on Palestine was issued in May, 1939, by the Secretary of State for the Colonies. In brief, it called for "the establishment within ten years of an independent Palestine State . . .": "Jewish immigration during the next five years (to) be at a rate which, if economic absorptive capacity permits, will bring the Jewish population up to approximately one-third of the total population of the country . . . some 75,000 immigrants over the next five years; the High Commissioner will be given general powers to prohibit and regulate transfers of land.")

On Oct. 2, the Histadruth (Federation of Jewish Workers) announced that it would bring immigrants into the country "by all ways and means." On Oct. 8, thousands of Jews took part in a general strike in protest against British policy. A re-

sistance movement was organized; a secret radio station began broadcasting, as "the Voice of Israel." On Oct. 31, a planned attack on Palestine's railroads resulted in several deaths. The Jewish Agency officially repudiated this attack, but warned: "(It) finds its capacity to impose restraint severely tried by the maintenance of a policy which Jews regard as fatal to their future."

The mood of Palestine Jewry is best understood in the light of the figures of Jewish decimation in European countries during the Nazi regime and in the light of restrictions on emigration to other countries. According to estimates, the surviving Jews in Germany (mainly deportees from other European countries), amounted to 275,000. In Austria, only 2,000 remain of original Austrian Jewry. In Belgium out of a prewar Jewish population of about 90,000, only some 20,000 have been found, of whom 6,000 were German and Austrian and 8,000 Polish. In the Netherlands, there were an estimated 25,000 Jews, out of some 180,000 before May, 1940; and of these, some 5,000 were refugees. Of 2,900 Jews in Luxembourg, only 400 have been found. In Poland, within barely two years, some 1,800,000 Jews were murdered by the Nazis in death camps or died of torture and starvation. In July, 1945, an official estimate was made of 80,000 surviving Polish Jews. In Soviet territories, between 200,000-250,000 more are assumed to be residing. In Czechoslovakia, no more than 15,000 are alive. In Hungary, of 800,000 Jews, about 280,000 survive. Of the original Jewish population of Rumania of 850,000, some 280,000-300,000 are accounted for. In Yugoslavia, of a prewar total of 80,000 there may be a maximum of 12,000 Jews. In Greece, of a prewar total of 85,000, about 18,000 Jews have been found alive.

The condition of the surviving remnants is precarious. In Poland, for example, by midsummer of 1945, almost 150 Jews had been massacred in pogroms. Since that time there has been a steady flow of Polish Jews into the American zone of occupation, due to violent anti-Semitism among the Poles. While the Nuremberg laws have been revoked in the liberated countries, Jews find it almost impossible to retrieve property stolen by the Nazis. Anti-Semitism, inculcated by the Nazis, is not easily eradicated.

Palestinian Jewry continued to develop during the war years. The present Jewish population is about 650,000. Since 1939, food output has risen 40-45 per cent. Industry has grown, so that in Tel Aviv, for example, the budget for 1945-1956 has reached £588,000. The Jewish National Fund increased its holdings to 704,859 dunams (each dunam is $\frac{1}{4}$ acre). The Jewish Brigade served well with the British forces in Italy.

The largest and strongest Jewish community in the world continued to be the American, with a population of nearly 5,000,000. In 1944, American Jewry provided \$17,500,000 for Palestine, \$20,000,000 for European relief, rehabilitation, and rescue. For health, cultural, and religious services \$6,200,000 were spent, in addition to local budgets of \$19,500,000. Over 500,000 Jewish men and women served in the armed forces; 35,000 were casualties; 8,200 died, or received awards for valor.

At the San Francisco Conference Jewish organizations were active among the consultants. The work for the inclusion in the World Charter of an International Bill of Rights was led by the American Jewish Committee and the American Jewish Conference.

The influence of Nazi theories of anti-Semitism had their effects in the United States too. The

American Nationalist Party, the Ku Klux Klan, and other anti-Semitic groups became active in the early part of the year, revealing a heightening of tensions. Recent studies of attitudes toward minority groups in America show a general increase of antagonistic feeling. Efforts to combat anti-Semitism have also broadened. Government, labor, industrial, educational, women's, and religious groups have inaugurated programs for curbing intolerance. In New York State, the Ives-Quinn Bill went into effect July 1, 1945, providing for a permanent five-member commission with full enforcement power to prevent racial and religious discrimination in employment. Similar state laws have been passed by New Jersey, Indiana, and Utah.

With the destruction of virtually all the traditional centers of Jewish culture in Europe, American Jewry prepares to make of the United States the main cultural center of the diaspora. The leading theological seminaries have laid plans for expanding their scope to include, besides the training of rabbis and teachers, the preparation of social workers, administrators, musicians, artists, and writers. Educational activities also developed. It was estimated that over 200,000 children were enrolled in all types of Jewish schools during 1944. A recent poll conducted by Elmo Roper revealed that events throughout the world had stimulated Zionist sympathies among American Jews. According to the poll, 80.1 per cent of those asked favored a Jewish state; 10.5 were opposed, while 9.4 were undecided.

The presence of such a vast number of Jewish men and women in the armed forces, and the fact that European schools and libraries had been destroyed, laid a heavy responsibility upon American Jewish organizations to provide cultural and religious guidance to the Jewish service personnel. The National Jewish Welfare Board, in cooperation with many groups, distributed during 1944 152,000 Bibles, 377,000 prayer books, 513,000 Jewish calendars, and 1,060,000 pamphlets and books of Jewish interest, covering a wide range of topics from religion and history to postwar problems.

American Jewry must not only be called upon to provide relief for Jewries abroad, but also to maintain standards of religious and cultural life; and to guarantee that refugees coming to these shores will not become a charge upon the community. The closing week of 1945 witnessed the issuance of a directive by President Truman, admitting refugees to the United States to the full extent of the immigration laws. "Responsible welfare organizations," he announced, "now at work in this field, will guarantee that these children will not become public charges." A large percentage of those expected will be Jews. For this purpose, the National Refugee Service, organized in 1939, will have to expand its activities.

Latin American Jewry has begun to play a more important role in world Jewry since the European centers were liquidated. Although the total Jewish population in South and Central America number little over 500,000, the Jewish communities are becoming more aware of their future role. The possibility of building strong Jewish communities is brighter since the Inter-American Conference held in Mexico City in March, 1945, when a resolution against racial and religious discrimination was passed. The resolution reads in part: "Be it resolved, 1) to affirm the principle recognized by all the American states of equality of rights and opportunities for all men, regardless of race and

religion; 2) to recommend to the Governments of the American Republics that, without prejudicing the freedom of the spoken or written word, they make in their respective countries every effort to prevent all acts which tend to provoke discrimination between individuals by reason of their race or religion." Recent events in Argentina, inspired by the followers of Peron, have violated the spirit and letter of the resolution. Whether the will of the Peronists will prevail against the Inter-American resolution, remains to be seen.

IRA EISENSTEIN.

JOHNSTON ISLAND. An atoll in the central Pacific, 809 air miles southwest of Honolulu, belonging to the United States. Useful as an advance observation post in the Hawaiian defense system, it is under the jurisdiction of the U.S. Navy Dept. With funds appropriated by Congress in 1939 and 1941, the atoll was converted into a naval base for aircraft and submarines. On May 15, 1941, the island was designated a "naval defensive sea area" and on Aug. 15, 1941, the naval air station was commissioned. During World War II the island remained under the control of U.S. armed forces.

JOINT BRAZIL-UNITED STATES DEFENSE COMMISSION. A Commission composed of military delegates (Army, Navy, and Air Forces) of the two countries, established in August, 1942. Meetings are held in Washington for the purpose of making staff plans for the mutual defense of the Western Hemisphere. U.S. Chairman: Maj. Gen. J. G. Ord.

JOINT CHIEFS OF STAFF, U.S. Under the direction of the President, the Joint Chiefs of Staff consult together on matters of joint concern to the armed forces, advise the President as to their use, and take appropriate action to implement his plans and policies as Commander in Chief of the Army and Navy. The Joint Chiefs of Staff comprise the United States membership of the Combined Chiefs of Staff (q.v.).

Office of Strategic Services (OSS) On June 13, 1942, the Office of Strategic Services, formerly the Office of Coordinator of Information, was placed under the jurisdiction of the Joint United States Chiefs of Staff. The Office was terminated October 1, 1945. Some of its functions were transferred to an Interim Research and Intelligence Service, and the rest were assigned to the War Department.

Army and Navy Staff College. The Army and Navy Staff College was established pursuant to a directive issued by the Joint Chiefs of Staff on April 23, 1943. Officially opened on August 5, 1943, the College operates under the direction of the Joint Chiefs of Staff. It provides a special course of instruction for specially selected and qualified Army, Navy, and Marine Corps officers in order to increase efficiency in the performance of command and staff duties in unified and coordinated operations of the Army and Navy forces. Commandant: Lt. Gen. John L. DeWitt.

JOINT MEXICAN-UNITED STATES DEFENSE COMMISSION. A Commission organized Jan. 12, 1942, to study problems relating to the common defense of the United States and Mexico, to consider broad plans for the defense of Mexico and adjacent areas of the United States, and to propose to the respective governments cooperative measures. U.S. Chairman, Vice Adm. David W. Bagley.

JOINT PATENT INTERCHANGE COMMITTEE, British-American. A Committee created pursuant to the British-

American Patent Interchange Agreement signed Aug. 24, 1942. The Agreement has for its purpose facilitating the interchange of patent rights, inventions, technical information, designs, and processes between the two governments under the lend-lease and mutual-aid programs. The Committee meets jointly as well as in its American and British sections. Problems pertaining to both governments are finally resolved by the Joint Committee and appropriate recommendations are made to the proper authorities of both governments.

American chairman: Justice Harold M. Stephens. British chairman: Sir Henry Self.

JOINT WAR PRODUCTION COMMITTEE—United States and Canada. The Joint War (originally, Defense) Production Committee of Canada and the United States was established on Nov. 5, 1941, by the President of the United States and the Prime Minister of Canada, to coordinate the capacities of the two countries for the production of war materiel. The Committee has in the main functioned through the organization of 10 joint technical subcommittees composed chiefly, on the Canadian side, of Government production executives and, on the United States side, of War Production Board officials and procurement officers from the armed services. These 10 joint technical subcommittees are: Tank-Automotive, Artillery, Artillery Ammunition, Small Arms and Small Arms Ammunition, Chemicals and Explosives, Signal Corps Equipment, Conservation, Aircraft, Naval Shipbuilding, and Merchant Shipbuilding. Chairmen: U.S. Section, William L. Batt; Canadian Section, H. J. Carmichael.

JUILLIARD MUSICAL FOUNDATION. A foundation incorporated in New York State in 1920, in accordance with the will of Augustus D. Juilliard, to aid worthy students of music, promote the instruction of the general public in the musical arts, and to encourage a deeper interest in music in the United States. Invested trust funds had a book value of about \$12,000,000 in 1945; only the income is distributed. Secretary: M. Steilen, 31 Nassau Street, New York City, 5.

JUSTICE, U.S. Department of. A Department of the U.S. Government which in 1945 had the following divisions and offices.

Office of the Attorney General
Office of the Solicitor General
Office of the Pardon Attorney
Antitrust Division (q.v.)
Tax Division
Claims Division
Lands Division
Criminal Division
Customs Division
War Division
Administrative Division
Federal Bureau of Investigation (q.v.)
Bureau of Prisons
Immigration and Naturalization Service
Board of Parole
Board of Immigration Appeals

Attorney General in 1945: Thomas C. Clark. Solicitor General: Charles Fahy.

JUVENILE DELINQUENCY. The last 4 months of 1945 were without combat for the armed forces of the United States, but many of the same conditions persisted for children that had unsettled their lives and had caused some of them to become "delinquent." Large numbers of fathers were still absent from home; the uncertainty of mothers about when fathers would return was substituted for apprehension about their physical safety. Overcrowded living and school conditions continued, as well as

laxity of supervision, because mothers were still working and had no satisfactory place to leave their children during working hours. When war ended some families pulled up stakes in the swollen communities of production for war and, without a place to live, turned toward their former homes or to new communities, just when the makeshift shelters had begun to feel like home to the younger children. Undesirable commercial entertainment places still operated around the crowded boom towns to attract the older children in the absence of wholesome recreation facilities. Moreover, the general spirit of excitement and adventure aroused by war was present throughout the year, creating in some children restlessness, defiance of authority, and aggressive behavior, and leading them to commit specific acts that are regarded as delinquency.

But the same encouraging fact held true through this year as through other war years, that most children took the confusion, hardships, and deprivations well. In spite of the spectacular misbehavior of some of teen age the majority conducted themselves admirably.

Extent of Delinquency. The extent of juvenile delinquency, and especially the question of its increase, is still a live subject in newspapers and magazines, but is impossible to gage on a nationwide scale. Few communities have an accurate statistical picture of the misbehavior of their children. Only children brought into court or dealt with by the police can well be counted, but scores of others commit the same "delinquencies" without being apprehended, and others have their misconduct handled by parents, relatives, friends or social agencies. The police commonly try to avoid "giving a child a record," by not reporting for juvenile-court action delinquencies considered not serious.

The most comprehensive figures on this subject are those reported yearly by juvenile courts to the Children's Bureau in a series begun in 1927. Even these figures have well recognized limitations, which the Bureau is attempting to lessen.

These figures show an upward swing in the number of cases disposed of in 1940-44 by 81 of these courts that serve areas of 100,000 or more population—an increase of 44 percent in total cases, 39 in boys' cases and 67 in girls' cases. Conditions in the expanding war-affected areas were attended by an increase in juvenile-delinquency cases disposed of by courts that was more marked than in other areas. In 38 courts located in areas of increasing population the increase was 46 percent, whereas in 43 courts in areas of declining population the increase was 40 percent from 1940 to 1944.

During 1944, 118,626 delinquency cases were disposed of by 380 juvenile courts that served areas representing about two-fifths of the total population of the United States. Of these, 95,827 were boys' cases and 22,799 girls'.

The greatest concentration of children referred to court was in the 14 to 16 age group. The ages when referred to court were reported in 87,450 of the boys' cases and 20,913 of the girls'. Of these, 85 percent of the boys' cases and 48 percent of the girls' involved children in the 14 to 16 age group. In 4 percent the child was under 10.

The reasons for reference to court were reported in 88,027 of the boys' cases and in 21,041 of the girls'. Of the boys "stealing," with 40 percent, ranked first in the reasons for reference; "acts of carelessness or mischief," 20 percent, was next. Sixty percent of the girls' cases were referred to court for "being ungovernable," "running away," or

"sex offenses." These three reasons must be considered together, because ungovernable behavior and running away frequently involve sex offenses, also some courts use the term "ungovernable behavior" to avoid recording a sex offense.

The types of disposition were reported in 109,745 of the total cases disposed of by these 380 courts in 1944. Of these, 44 percent were dismissed, adjusted, or held open without further action; in 32 percent, the child was referred to the probation office for supervision, and in 9 percent, the child was committed or referred to an institution.

Proposals for Action. Because juvenile delinquency results from many causes, including breakdown in home life and in community safeguards and services to children, it can be attacked only through a wide range of measures based on the needs of all children and young people. Its control requires action of individual parents, the school, the church, and local social and civic agencies. Moreover, the State and Federal Governments have an important role to play in providing information, guidance and, when necessary, financial assistance.

Of significance in presenting a nation-wide program that focuses on the total needs of children, is a publication issued in April 1945 by the Children's Bureau, *Building the Future for Children and Youth*. It presents proposals for action made by the National Commission on Children in Wartime.

To achieve social and health services of high quality for all as a public responsibility, the Commission urges that Federal and State funds be appropriated in sufficient amounts so that each State may reach certain goals in 10 years. This means the expansion of existing services for maternal and child health, for crippled children, and for child-welfare services under the Social Security Act. Of these three services the last is of greatest importance to the prevention of delinquency among children.

The action proposed is the granting of Federal funds to States for extending and improving child-welfare services in amounts sufficient to make possible State-wide coverage within 10 years, so that "each State is able to assure to children in all its political subdivisions, urban and rural, access to the services of workers trained to deal with the problems of children who have special needs." The Commission recommends also that programs administered by the Social Security Board having to do with the support of children, that is, insurance and public assistance, be extended and improved, and that grants of Federal funds be made to States to share the cost of assistance for needy families not now eligible for other types of public assistance. In addition, the Commission urges Federal aid for education so that full opportunity may be assured to all children and youth, and recommends the strengthening of Federal child-labor legislation to cover current gaps in the protection of child workers. Proposals for State action also include a 16-year minimum age for employment and safeguards for adoption. The Commission proposed for immediate study a correlated mental-hygiene program; guardianship of children; leisure-time services; and a comprehensive program.

The need for services for various special groups is mentioned, for example: "Community resources for mentally deficient children are grossly inadequate everywhere . . . The cost to society of neglecting the needs of mentally deficient children is high, not only because large numbers of

children who might be fitted for community life by special training fail to receive it, but also because mental deficiency looms large in the problem of juvenile delinquency."

Community Interest. An encouraging factor was a growing awareness on the part of adults of conditions that lead to delinquency and an interest in methods for its prevention and treatment. This interest has not been confined to those with responsibility in this field, such as judges of juvenile courts, police, child-welfare workers in publicly and privately supported agencies; it has been shown by workers in related fields and by civic groups. As a result the subject has been widely discussed, efforts have been made to improve the practices of existing agencies, projects have been developed, and activities coordinated. Some of the projects and attempts at coordination have been sound but some have been potentially harmful to the families and children they were intended to serve. For example, some emphasized punishment of parents whose children are delinquent rather than the need of these parents for help in meeting family situations in which delinquent behavior often has its roots, and in dealing wisely with children's problems before they become serious. Efforts being made to develop "schools" for parents of delinquent children are effective or futile according to the caliber of leadership and to what is taught. Some civic groups are attempting to develop "courts" or councils staffed by lay persons to hear cases and recommend treatment. Such a procedure may be dangerous because it takes on, without proper authority, judicial functions and undertakes treatment that only qualified workers should give. Nevertheless, awareness of the problem and the desire to do something about it are constructive.

More than usual attention has been focused on the conditions under which children are detained pending the disposition of their cases. The report of the National Commission on Children in Wartime, *Building the Future for Children and Youth*, says: "Large numbers of children are held in jails where they are confined with adult offenders and subjected to conditions that threaten their health and well-being. Although many States have laws prohibiting the detention of children in jail, lack of suitable detention facilities for children in many communities results in the use of jails for this purpose, even in some instances where the children are held for reasons other than delinquency. Many of these children are very young. In one State 500 children under 16 were detained in jail during a recent year, 84 of them being under 12 years of age. The records of two rural counties in another State showed 66 children under 16 detained in jail during the last 6 months of 1943 in one and 55 during the last 4 months of 1943 in the other. Children in jail seldom have access to . . . any of the things children need, even suitable food, yet their stay is sometimes prolonged for weeks and months."

One group of young delinquents that increased in many communities during the war is greatly affected by the quality of detention quarters. They are boys and girls who run away from home to seek adventure, or to escape from some situation in their families or home communities that has made them unhappy. Many of them are as young as 12, some even younger. About 9,700 were dealt with in 1944 by 380 juvenile courts, although this number includes children who did not leave their own cities. The number does not include, however, children dealt with by the police and social agencies

without reference to court. Most communities have no suitable places for these children while plans are being made for them, and either lodge them in jail, although no charges may have been made against them, or encourage them to move on.

Instead of this unintelligent response to their plight, these children should have resourceful help. Their situations call for social services in the community in which the child is found and also in his home community. Many of these young people are confused and fearful. They need help from a person who can win their confidence and give them reassurance. This help should be given by social workers who have an understanding of the behavior of children and adolescents and who have experience in dealing with them. The parents of the child also need help in planning for his return, if that is the plan decided on. Supervision may be needed by the child or his family after his return if he is to make a good adjustment. Social services may also play an important part in safeguarding a child from return to an unfit home. Sometimes children have run away from situations or conditions that involve cruelty on the part of parents, including physical abuse, as well as from conditions less tangible but nevertheless serious. To add to this flight from unhappiness detention in jail, possibly with adult offenders, is to give a child a most disturbing experience.

The Children's Bureau has become particularly aware of an awakening interest in this problem. An increasing number of requests were received during the year for information about approved practices, building plans, use of foster homes for detention, and the relative costs of various methods of care. Many communities reported to the Bureau their concerted efforts to study the problem and take action on it, and several States reported action at the State level, which is a new approach to this particular type of care. In addition, the National Probation Association has under way a study of types of detention care and practice in selected communities.

Role of the Child-Welfare Worker. Hundreds of thousands of children in the United States are living under conditions that prevent their full growth and development and deprive them of the opportunities and advantages that help them to become good citizens. Many children cannot be cared for in their own homes or are cared for inadequately there because of the absence of one parent or both, or because of incompetency of the parents that results in neglect or in constant family discord. Individual difficulties or physical or emotional handicaps create problems of adjustment in school and in play. Some children overcome all the obstacles to wholesome development that are in their paths, and grow into adults adjusted to hold their own. Others break in some way at some time for lack of a secure home life, affection and appreciation from their parents, and constructive recreational activities. From their number come many of the children labelled as "delinquent."

The child-welfare worker is in the community to help prevent these breakdowns and the necessity for authoritative action, to open doors of what opportunity is offered by the community to its children, and to encourage the creation of new advantages for them. This, in brief, is her approach to the prevention and control of juvenile delinquency. If a child needs care away from his own home, the child-welfare worker may assist in finding a foster home that is suitable and as much like a home of his own as possible.

If child-welfare workers are to safeguard chil-

dren and promote their interests, they must be easily available to parents and children where they live, which means throughout each State and to each community. As of June 30, 1945, more than half of the 1,971 workers, paid from Federal, State, and local funds providing service to children on a full-time basis, were located in 8 States. The uneven geographical distribution appears more strikingly on a county basis. More than two-fifths (43 percent) of the 1,971 full-time workers were employed in 61 counties containing cities of 100,000 or more. The lack of child-welfare staffs in large sections of the nation is further indicated by the fact that in only 504, or 16 percent, of the 3,100 counties were there one or more full-time child-welfare workers. In other counties, services were known to be available under other arrangements, that is, from workers responsible for serving several counties, or were not available at all. Limited funds are not the only obstacle to making these services country-wide; the shortage of qualified workers for local positions is still serious.

State Planning. Other proposals of the National Commission on Children in Wartime are for the development of social planning in the States by a council or commission on children and youth. This body should be a part of the State planning board, if such organization is appropriate, or a separate body appointed by the Governor and directed to perform the functions he may prescribe. Its functions, in general, would be to "provide a center of information on children and youth and to promote action in their behalf," its work supplemented by citizens' organizations that study its recommendations and give their support to those they approve. The council should be equipped to ascertain the facts by encouraging sound research by State departments and agencies and by correlating the results of this and other authoritative research; to review legislation; to appraise services; to consult with all agencies and groups concerned with or about services to children; to formulate proposals; to report findings to the public; and to encourage and foster local community planning and action. For this local planning the Commission gives detailed suggestions based on the experience of local groups.

State planning and coordination of services to children provide an essential approach to the problem of delinquency—for which there is no quick, sudden, or dramatic solution. Only through development of a program unifying the forces that spell security and opportunity for all children and young people is it possible to deal with the matter successfully.

KATHARINE F. LENROOT.

KARAFUTO. The Japanese part (south of 50° N.) of Sakhalin island; occupied and taken over by the U.S.S.R. following the defeat of Japan by the Allies in 1945. Area, 13,935 square miles. Population (census of October, 1940), 414,891. Chief towns (Jan. 1, 1938, populations): Toyohara, the capital, 37,365; Esutoru, 31,959; Shikka, 24,399; Otomari, 24,269. Chief products: paper, fish, coal, and petroleum.

KELLOGG FOUNDATION. A foundation established by W. K. Kellogg in 1930 to advance the well-being of children without regard to race, creed, or geographical boundary. Expenditures for year ended Aug. 31, 1945, were \$1,803,962.61. Total capital assets on that date were \$46,927,165.94.

The Foundation has undertaken and administers the Michigan Community Health Project,

a health program involving seven counties in southwestern Michigan. The present program includes also national and international health promotion activities and the granting of fellowships. President and General Director: Emory W. Morris. Headquarters: Battle Creek, Mich.

KINGMAN REEF. An atoll in the Pacific Ocean 1,067 miles southwest of Honolulu, Hawaii, owned by the United States. The reef is about eight miles long and the lagoon five miles wide, but only a small area of land remains uncovered at high tide. The Navy Department has jurisdiction over the atoll. Its strategic importance is due to its being the only seaplane base located between Honolulu (1,067 miles to the north) and Pago Pago (1,797 miles to the southwest).

KOREA (Chosen). A country between the Yellow Sea and the Eastern Sea in eastern Asia, annexed by Japan on Aug. 22, 1910; incorporated as an integral part of the Japanese empire from 1919 until September, 1945, when Japan surrendered the country to Allied armed forces.

Area and Population. Area, 85,246 square miles. Population, 24,326,327 at census of Oct. 1, 1940. The racial division of the population on Jan. 1, 1939, was: Koreans, 21,950,716; Japanese, 633,320; foreigners (mostly Chinese), 94,815. Chief cities: Seoul (Keijo), the capital, 935,464 inhabitants in 1940; Pyongyang (Heijo), 285,965; Pusan (Fusan), 249,734; Taegu (Taikyū), 110,866; Inchon (Jinsen), 102,473. The Koreans have their own spoken and written language.

Education and Religion. About 60 per cent of all adults were illiterate. There are many modern schools. At Seoul (Keijo) there is a university. The chief religions are Confucianism, Buddhism, Shintoism, and Christianity.

Production. Over three-fourths of the working population is engaged in agriculture and forestry. About one-fourth of the cultivated area is devoted to rice. Other crops include barley, millet, soybeans, rye, wheat, cotton, and apples. Silkworm rearing is an important occupation. Livestock (1939): 1,705,000 cattle, 1,400,000 pigs, 51,000 horses, 20,000 sheep. The important minerals produced are gold, iron, coal, and graphite. Mica, molybdenum, and wolfram, are found.

The chief industries are cotton spinning, and rayon weaving. Other manufactured products are fertilizers, cement, chemicals, paper, saké, pottery, flour, electric bulbs, and enamelled ironwares.

Foreign Trade. Korea's merchandise trade with other parts of the Japanese Empire during the first 10 months of 1940 was: imports, 1,121,900,000 yen; exports, 614,100,000 yen. Merchandise trade with foreign countries during the first nine months of 1940 was: imports, 168,200,000 yen; exports, 150,700,000 yen. The chief exports are rice, fertilizer, crude copper containing gold and silver, raw silk, and soybeans.

Finance. Budget estimates for the fiscal year ended Mar. 31, 1942, balanced at 1,012,577,000 yen. The public debt on Mar. 31, 1938, was 593,546,214 yen. The yen exchanged at \$0.2596 in 1939, \$0.2344 in 1940 and 1941 (first 7 months).

Transportation. Railways extended about 3,345 miles on Jan. 1, 1941 (state lines, 2,469; private, 876). Highways extended 19,048 miles in 1940. Airlines linked Keijo with the other chief cities of Korea, Japan, Manchukuo, and North China. Shipping entering the open ports in 1938 totaled 14,677,742 tons.

Government. Under Japanese occupation, the

country was ruled by a Governor-General appointed by the Emperor of Japan until October, 1942, when it was unified with that of Japan proper and placed under the jurisdiction of the Japanese Home Minister. A Korean "provisional government" and "restoration army" were established in Chungking in 1940. The joint communiqué issued Dec. 1, 1943, following the Cairo Conference of President Roosevelt, Prime Minister Churchill, and Gen. Chiang Kai-shek, declared that the United States, Britain, and China "mindful of the enslavement of the people of Korea, are determined that in due course Korea shall become free and independent."

Events, 1945. The problem of reestablishing Korea as an independent democratic state received the attention of the "Big Three" at the conference held in Moscow on Dec. 27. The report recommended the "earliest possible liquidation of the disastrous results of protracted Japanese occupation." The conference authorized the setting up of a provisional Korean democratic government "which shall take all necessary steps for developing the industry, transport and agriculture of Korea and the national culture of the Korean people."

In order to carry out the provision for establishing a provisional Korean Government, "there shall be established a joint commission consisting of representatives of the United States Command in southern Korea and the Soviet Command in northern Korea."

(Korea is divided along the 38th parallel, with the American Army in control in the southern part and the Soviet Army in control of the northern part.)

In carrying out this program the Joint American-Russian Commission was authorized to consult with the Korean democratic parties and social organization, according to the Moscow report, which stated that the recommendation worked out "shall be submitted to the governments of the U.S.A. and the U.S.S.R., the United Kingdom and the Republic of China prior to final decision by the two governments represented on the Joint Commission." Continuing it stated,

"It shall be the duty of the Joint Commission—with the participation of the provisional Korean democratic government and Korean democratic organizations to work out measures for helping and assisting (trusteeship) the political, economic and social progress of the Korean people, the development of democratic self-government and establishment of Korean national independence."

The proposals of the Joint Commission (American-Russian) shall be submitted—following consultation with the Provisional Korean Government—for the joint consideration of the Governments of the U.S.A., the U.S.S.R., United Kingdom and China, "for the working out of an agreement concerning a four-power trusteeship of Korea for a period up to five years."

In order to carry out the foregoing recommendation the Moscow Conference ordered a conference of representatives of the American and Russian Commands "within two weeks." Heretofore there had been no communication whatever between the two military groups and while Soviet consular representatives are stationed at Seoul, the capital, which is in the American zone, no American consular or other officials or American newspaper correspondents were permitted within the Russian zone. No communication or travel was permitted between the two zones, which was responsible for serious misunderstanding and distress on the part of the people, because all supplies of coal are in the Russian zone in the north, while practically all

rice is produced in the southern part controlled by the Americans.

Korea Discussed at Cairo and Yalta. While the complete discussions concerning the disposition of Korea have not been published, the announcement of the Moscow Conference, providing for a 5-year trusteeship, created serious complications with the Koreans who staged numerous meetings of protest (in the American zone) and there was considerable rioting and some stones were thrown at American soldiers. Korean leaders asserted that the splitting of their country by the Americans and the Russians "had divided three of Korea's thirteen provinces with the governors of the three provinces coming under the jurisdiction of both the American and Russian administrations—and there is little similarity between the two administrations and virtually no liaison," said the Korean spokesman. The Koreans, according to a *United Press* dispatch from Seoul on Sept. 19, declared the "major crime" of the Allied set-up was that the Allies had "broken faith with small countries in the Far East." With respect to Korea, the Cairo Conference had adopted a resolution declaring that Korea "would become free and independent in due course." The bisecting of the country would hinder independence and prevent the integration of the country. The Koreans demanded that the Japanese-built industrial empire in Korea be turned over to the Koreans "in payment for the years when the Japanese bled the wealth of the country."

The Korean spokesman then made the significant declaration that the withdrawal of the American and Russian armies might be followed by the creation of two governments in Korea, one Communist fostered by the Russians and the other democratic fostered by the Americans.

The Koreans pointed out that the Russians in north Korea controlled virtually all of Korea's hydro-electric power, heavy industry, coal and iron, while the southern part of the peninsula produced most of the rice, fish, and other foods. Americans admitted that in order to obtain supplies of coal it was necessary for them to ship coal from Japan, because the Russians in northern Korea "even refused to discuss the subject."

MacArthur Also Critical. In his report on the Military Government in Japan and Korea on Jan. 2, 1946, Gen. Douglas MacArthur also referred to the complications in Korea and urged an early conference on the part of the Americans and Russians. He declared there was "confusion everywhere in the entire economic, political and social structure of the country." The lack of qualified Korean administrators left the Allies with only two alternative courses, (1) continue the foreign military administration with Korean advisers, or (2) continue the Japanese administration. He said that up to the present the Koreans had developed only two definite opinions—hatred of the Japanese and the desire for independence.

Gen. MacArthur said that at a recent gathering of 1,200 Koreans, (Oct. 24, 1945) there were fifty-four political parties represented which were registered with the Military Government. "The aims of many of these parties were vague and obscure and only had a few dozen followers," he said. The only common desire apparently was to "seize Japanese property, expel the Japanese, and establish independence and self-rule immediately."

Two Leading Groups. Chief political contenders for the right to rule Korea were the "Korean People's Republic (radical)" and the Korean Democratic Party (conservative). Both sides claimed the two popular and outstanding leaders, Kim Koo and

Sigman Rea. According to Gen. MacArthur's report the "Korean's People's Republican Party was most active and articulate and had adopted a platform calling for changes in land-ownership, speedy expulsion of Japanese and collaborators, higher wages and stable prices." He said the radicals generally praised the Russians and denounced the Americans, while the conservatives praised the Americans and denounced the Russians.

Gen. MacArthur referred to the economic complications caused by the "long holiday" which practically all Korean workers took immediately after the Japanese capitulation. There were further complications due to the return to Korea of thousands of "slave laborers" from Japan. With reference to the problems of repatriation MacArthur's report stated there were about 2,000,000 Koreans in Japan, including 350,000 contract or requisitioned laborers. About 160,000 had been repatriated by Oct. 31 and within the same period about 110,000 Japanese soldiers and sailors had been sent back to Japan. Of the 700,000 Japanese civilians in Korea, some 71,000 had been sent home by Oct. 25.

Hodge's Report. The American commander in Korea, Lt. Gen. John R. Hodge, reported on Jan. 2 that he had opened negotiations with the Soviet Consulate in Seoul to arrange a meeting with the Russian commander in northern Korea in order to carry out the instructions of the Moscow Conference. Gen. Hodge said that the latest and most significant political development was a reported offer of the leftist Korean People's Republic to merge with the Provisional Government and offer the resultant coalition to the Allies as a "provisional government" for which the Moscow Big Three Conference had called.

A further important development was a call issued by Kim Koo of the Provisional Government and David Um, Information Minister to all Koreans to conclude their 4-day celebration and go back to work, end strikes, and cooperate with the American Military Government. According to a report by the *United Press* there was hope in Seoul that a definite program for the creation of an independent Korean administration might result from the Moscow action. There was a further reference to the Cairo Declaration that Korea "was to be permitted to choose its form of government by a national plebiscite and this was to be accomplished by grouping all of the political factions behind the two major groups. It was said the American position was "that Korea had been promised its independence at the Cairo Conference (Roosevelt, Churchill and Chiang Kai-shek) and that the United States would not recognize any group as a legal government pending the plebiscite."

There was a feeling, however, in American circles that the Korean Provisional Government was entitled to chief consideration because it had been organized originally at Seoul in 1919 and since had existed in exile in China and had received the recognition of China and France.

It was explained that in the Russian administered area the Soviet authorities had turned over much of the local administration to the so-called "Korean Committee of Liberation." Within the American zone it was reputed that forty-three political groups had decided to unite under the leadership of Kim Koo of the Provisional Government. Another minority group calling itself the "people's republic" had been ordered dissolved.

Considerable uncertainty existed because of the failure up to the present to publish the discussions concerning the future of Korea which took place

at the Yalta Conference, where it was alleged Stalin had taken a strong stand for Russia's dominant position in any future Korean Government.

Red Korean Army. The Korean Foreign Minister, Joso-Wang, explained that there were two complicating elements in the Korean situation which had not received adequate attention in the press. The first was the entrance into Korea of 30,000 Korean troops which had been trained and armed in the Soviet Union. Russia began training Korean troops at Vladivostok in 1935. These troops, serving under Russian officers, had entered northern Korea immediately after Russia's declaration of war against Japan, and were now in control of the areas about the ports of Yuki and Rashin, both important harbors.

In addition to the Russian trained and officered Korean divisions, there were "several thousand" Korean troops in the Chinese Communist forces of Gen. Chu Teh, now allegedly marching overland to Korea. Mr. Joso-Wang stated that prior to Russia's declaration of war the Russians had prevented the Korean Provincial Government in Chungking from communicating with Korean groups in Siberia. He declared, "even now the Korean Provisional Government is experiencing difficulty in establishing relations with the Russians in northern Korea. Joso-Wang called attention to a further complicating element in the military situation, due to the presence in the Japanese Army on the continent of many thousands of Korean soldiers." They had been recruited and trained by the Japanese, given Japanese names and uniforms and scattered through many of the Japanese armies all the way from China to the South Seas. Mr. Joso-Wang thought that all of these Korean soldiers would ultimately return to Korea and exert political influence. It was reported that large numbers of Koreans were congregating in Shanghai in the hope of obtaining ships to return to their homeland. It also was stated that a considerable number of Korean officers had been trained at the Chinese Central Military Academy in Nanking, and they also would be wanting to return to a liberated Korea.

The Soviet Magazine *New Times* in Moscow recently attacked the Korean Provisional Government in Chungking (now in Korea) and also the Korean spokesman in the United States, Singman Rhee, on the ground that "neither had any authority to speak on behalf of the Korean people." The Moscow magazine declared that Mr. Rhee "on several occasions had made statements hostile to Korea's nearest neighbor, the Soviet Union, and that now as the liberation of his country nears he is worried by the ghost of the Soviet danger—a danger which Rhee himself had created." The Moscow paper said that since Korea was a continental country it could achieve its greatest development "by receiving economic, technical and cultural help from the Allied nations and primarily from the powerful neighboring continental countries."

Entrance of Russian and American Troops. Russian troops first landed on Korean soil on Aug. 12 or slightly less than a month before the initial American landing which took place on Sept. 8. The first landing was at the recently Japanese-constructed ports of Yuki and Rashin on the upper northeast Korean coast opposite the Russian port of Vladivostok. The American landing took place at Jinsen on the western coast of the peninsula. There was considerable fighting between the Russians and Japanese troops in north Korea, but since the American landing was after the Japanese capitulation there was no Japanese resistance there and the

Americans were given a hearty welcome by Korean civilians.

The Koreans, however, quickly became resentful due to a misunderstanding resulting from a statement by Gen. Hodge that he intended to retain the Japanese administrators, and, temporarily at least, "govern through the Japanese command." Hodge also expressed the opinion that "half to two-thirds of the Koreans are afraid of the Russians."

Gen. Hodge, a graduate of the University of Illinois, had an excellent record in France in World War I and as an administrator on Leyte and Okinawa in World War II. Reports from other American sources, including the representative of the State Department attached to Gen. Hodge's Headquarters all referred to the "scarcity of competent Korean administrators who were not tainted with the charge of collaboration with the Japanese." It was explained in a dispatch by Homer Bigart in the New York *Herald-Tribune* on Sept. 11 that Gen. Hodge "had received only the vaguest directives from any quarter and in consequence had assumed he was expected to govern through the Japanese command." General Hodge was quoted as declaring, "who the government will be, I don't know. It will be decided on a higher level than mine." MacArthur immediately issued instructions to Hodge "to replace all Japanese in Government positions in Korea as soon as possible, consistent with the safety of operations."

Awakening of the Koreans. Richard J. H. Johnston, correspondent for the New York *Times*, who arrived in Korea with the American vanguard, said the chief problem faced by the United States occupation forces "is the awakening political consciousness of 30,000,000 Koreans who for thirty-six years had been kept from open political activity by the Japanese masters of their country." Mr. Johnston said that there were "sudden and immature stirrings of political activity by at least a half dozen factions or shades of Korean opinion . . . but the tragedy here is immediately apparent in the fact that the Koreans, completely dominated by their oppressors since Japan annexed the country in 1910, are pathetically inexperienced politically."

Japanese Governor Removed. Gen. Hodge announced on Sept. 12 that Nobuyuki Abe, Japanese Governor-General had been removed from office. Gen. Hodge made the announcement to a delegation of about 1,000 Koreans representing fifty-one different groups, of which thirty-three were political or semi-political in nature. Gen. Hodge also announced the removal of Radao Nishihiro, director of the Korean Police Bureau. The functions of Governor-General Abe were taken over by Maj. Gen. A. V. Arnold of the 7th Infantry Division, while the Police Director's duties were assumed by Brig. Gen. L. E. Schick, Provost Marshal General of the U. S. Forces.

Anti-Korean Laws Repealed. Gen. Hodge on Sept. 19 announced through the office of Gen. A. V. Arnold, the military governor of Korea that five Japanese "anti-Korean" statutes had been repealed. Of these the three most important were, (1) abolition of a law preventing political expression by Koreans, and providing for indeterminate imprisonment for Koreans suspected of favoring independence; (2) abolition of the Japanese "act of publication," which required Koreans to submit copy of any book or magazine to the Japanese Governor-General for approval before publication; (3) abolition of the Japanese "Law of Shrine" which attempted to impose Shintoism on the Koreans and compelled all Korean school children to worship at Shinto shrines on all Japanese na-

tional holidays. The Japanese Shrine law gave large areas of land and a large subsidy to every shrine. Shintoism was used to force Korean submission to the Japanese throne.

Missionaries Opposed Shrine Law. The Japanese action in forcing Korean school children to worship at Shinto shrines became a serious issue between Japanese colonial administrators and the American missionaries in Korea who refused to permit the pupils in their mission schools to worship at the Shinto shrines as such action was contrary to the teachings of Christianity. Several of the missions in northern Korea were forced to close their schools and withdraw from Korea as a result of their refusal to comply with the Japanese "Law of Shrine."

American Congressmen Fostered Korean Independence Movement. The active part played in the present situation in Korea by the Korean Provisional Government, has attracted attention to the fact that a delegation of American Congressmen and Senators traveling through Korea in 1919 were indirectly responsible for the organization of the Korean Provisional Government. The American Congressional party on a tour through the Far East, was contacted at Shanghai by members of the Korean revolutionary factions, who arranged for a conference when the Congressmen reached Seoul, the capital of Korea. But when the Congressmen arrived at the hall in Seoul where the meeting was scheduled, none of the Koreans appeared—all had been arrested by the Japanese police and put in jail.

When the Congressmen learned of the situation a group led by the late Stephen G. Porter of Pittsburgh, refused to leave the hall until the Japanese released the Koreans. The Japanese were finally forced, with poor grace, to comply.

It was out of this incident that the so-called Korean Provisional Government was formed and a declaration of independence and provisional constitution adopted. Japanese political police, for years spent their time searching out and arresting members of the "Korean Provisional Government," who had fled to China. For several years the Korean revolutionaries maintained a secret headquarters in the French Concession at Shanghai where they received help from American missionaries and also from the Chinese. After the Japanese invaded the Shanghai area in 1937 many of the Koreans were killed by Japanese gangsters.

Korea's Troubled History. Korea, which the Japanese renamed Chosen, or Tyosen, after they annexed the country in 1910, had a traditional history extending back to 1122 B.C. when the Korean Empire was founded. According to the ancient literature of the country and of China, Korea's history extends back for 4,000 years. According to recorded history the Korean Peninsula and its population were annexed by China in 108 B.C., but Korea regained her independence from China about 100 A.D.

Chinese influence, language, customs and the Buddhist and Confucian religions were dominant in the Korean Empire through the centuries, until 1895 when China was defeated by Japan, and Chinese political and economic influence declined rapidly.

Russians Also Interested. Since the period between 1895 and 1905 marked the high point of Russian Czarist expansion into China's northeastern territories, there ensued a bitter struggle between Russia and Japan for a dominant position in both Manchuria and Korea. This struggle culminated in the Russo-Japanese War, which, aside from naval en-

gagements, was fought entirely on the soil of south Manchuria with northern Korea within the zone of hostilities.

Russia's defeat was followed by Japan's assumption of a dominant position in Korean affairs and a long period of intrigue culminating in the barbarous assassination of the Korean King.

Peace Conference at Portsmouth. At the peace conference between Japan and Russia, which was held at Portsmouth, New Hampshire, upon the invitation of President Theodore Roosevelt, strong pressure was exerted by the American President on both sides to force a compromise. Japan was induced to forego a heavy indemnity which she had planned to impose on Russia to cover the cost of the war which had practically bankrupted the Japanese. Instead the Japanese were induced to accept the southern half of Sakhalin Island and were given a free hand in Korea. After the war certain American firms were given valuable contracts in reconstructing the railways of South Manchuria which had fallen to Japanese control. Thus was exemplified the power politics of an earlier age.

In 1910 Japan put all pretence aside and annexed Korea, making it a territory of the expanding Japanese Empire. While the Japanese previously had referred to the Korean Peninsula as a "sword pointed at Japan's heart," they now referred to the peninsula as a "bridge connecting Japan with the Continent." It was reported that the Japanese were engaged during the late war in constructing a tunnel under the Straits of Tsushima connecting the main Japanese Island of Honshu with the southern point of the Korean Peninsula. The Japanese had already completed an under-sea canal connecting the two islands of Honshu and Kyushu in this vicinity, hence regarded the other project (150 miles) as feasible.

America "Opened" Korea to World Trade. The United States was the first Western Power to establish peaceful diplomatic and commercial relations with Korea and for a time American merchants enjoyed profitable trade relations, particularly in textile goods, in Korea. Of special significance was an "alliance" or treaty which the United States signed with Korea whereby the two countries agreed to come to each other's assistance in the event of an attack on either party by another country. The Koreans attempted to invoke this treaty, but without success when the Japanese seized the country in 1910.

The late Dr. Sun Yat-Sen, "father" of the Chinese Republic used to refer to this treaty between the United States and Korea and declare that "Had America intervened to prevent Japan's seizure of Korea in 1910, Japanese expansion on the Continent would have been blocked."

JOHN B. POWELL.

KURE (Ocean). An island in the Pacific located 56 miles northwest of Midway Islands. It is a coral reef having a circumference of 14.7 miles. By Executive Order the island was placed under the jurisdiction of the Navy Department as of February, 1936.

CHARLES F. REID.

KURILE ISLANDS (Chishima). A chain of 47 islands reaching from the Japanese island of Hokkaido to the tip of the Kamchatka peninsula in the eastern Asiatic U.S.S.R. The most important islands are Kunashiri, Etorofu, Uruppu, Shimushiru, and Paramushiro. Total area: 3,944 square miles. Population: 5,000, exclusive of a large number of hunters and fishermen who enter the islands from

the south during the summer. The islands were occupied by U.S.S.R. after the surrender of Japan in 1945. According to the text of a secret Yalta agreement (made public Feb. 11, 1946) signed by the "Big Three" at Yalta on Feb. 11, 1945, "The Kurile Islands shall be handed over to the Soviet Union."

KUSAIE. An island in the eastern Carolines of the Japanese Pacific Islands; under the control of the Allies following the defeat of Japan in 1945. Area, 45 square miles. There is a fine harbor with large commercial piers.

KWANTUNG. The territory occupying the southern part of the Liaotung peninsula in Manchuria, leased from China by Japan; surrendered by Japan in 1945 to Allied armed forces. Area, including 40 adjacent islands, 1,337 square miles. Population (census of October, 1940), 1,367,334. Chief towns (1938 populations): Dairen, 515,743; Port Arthur (Ryojun), 145,286; Pulantien; Kinchow. The chief industries are agriculture, fishing, and salt manufacture.

LABOR CONDITIONS. The year 1945 saw the beginning of a relaxing of governmental control of labor conditions and labor relations. In the United States, with the end of the war, restrictions on labor mobility were lifted, and wage increases by collective bargaining or otherwise were freed of the requirement of government approval provided they would not result in price increases. Despite substantial cutbacks in munitions, aircraft, transportation equipment, and shipbuilding, unemployment did not increase to the extent anticipated. At the end of the year, only 1,750,000 were so classified. The hours of labor decreased with the gradual resumption of the 40-hour week marked throughout industry. Average hourly and weekly earnings, likewise, decreased due to diminution in overtime pay through the abolition of extra shifts and decreases in hours. Toward the end of the year the number and extent of strikes increased. Most of the strikes were motivated by a desire to maintain wartime earnings in take-home pay. In Great Britain labor controls were continued by the Labor Government for five years. The number of strikes increased as compared with 1944 but were shorter in duration. In Canada price and wage controls were continued but manpower controls were lifted. In contrast with British experience, American and Canadian strikes decreased in number, but working time lost by strikes increased greatly in 1945.

Employment and Unemployment. The advent of World War II had induced a mobilization of manpower greater than ever before in American history. In five years the employed population was increased by some 17 million persons. In April, 1940, civilian employment totalled 45 million. There were about one-half million in the Armed Forces. By 1945 the civilian labor force in the United States had reached a summertime peak of 55,220,000 but, as in 1944, declined to approximately 53,500,000 by the closing months of the year.

About 83 percent of all employed workers were in non-agricultural industries, the remaining 17 percent on farms. While the decline in agricultural employment during the war was about 9 percent, farm production was one-third greater than the average for 1935 to 1939. The number of men and women in the Armed Forces reached 12,300,000 immediately prior to the end of the war, but declined to approximately 10 million by the end of the year. By December 1945 the number of idle workers was estimated at 1,750,000.

Employment in the aircraft, shipbuilding, transportation equipment and ordnance industries declined drastically. Airframe workers reached over 900,000 in 1943, but dropped to less than 250,000 by August of 1945. Shipyard rolls declined after V-J Day to 762,300 on Sept. 15 as compared with a wartime peak of 1,722,500 in December, 1943.

ESTIMATES OF THE CIVILIAN LABOR FORCE, AGRICULTURAL AND NON-AGRICULTURAL EMPLOYMENT IN THE UNITED STATES IN OCTOBER 1942, 1943, 1944, 1945

(Millions of persons 14 years and older)

Labor Market Status and Sex	October 1942	October 1943	October 1944	October 1945
Total Labor Force	54.0	52.6	52.9	53.1
Employed	52.4	51.9	52.2	51.6
Non-agricultural Industries	41.9	41.2	43.5	42.8
Male	29.2	26.7	27.3	27.0
Female	12.7	14.5	16.2	15.7
Agriculture	10.5	10.7	8.8	8.8
Male	8.9	8.8	6.8	6.6
Female	1.6	1.9	2.0	2.2
Unemployed	1.6	0.7	0.6	1.55
Male	0.9	0.4	0.3	0.93
Female	0.7	0.3	0.3	0.62

In September the President abolished the War Manpower Commission together with virtually all of the controls, such as the requirement of statements of availability from individual employees, which had been imposed in order to direct the flow of wartime labor into high priority defense industries.

By 1945, 83,000 foreign workers had been recruited for work in the United States. Sixty-seven thousand of these were brought from Mexico to fill vacancies on American railroads, and 16,000 from the West Indies. Some 64,000 prisoners of war were working in food-processing plants, foundries, forestry and logging work, and other industries. After V-J Day the return of foreign workers to their homes was begun, and by the end of the year the number had declined to approximately 33,000.

In Great Britain the civilian labor force declined from 22,400,000 in June of 1944 to 21,652,000 in May of 1945. Unemployment, while almost twice that of 1944, was nevertheless quite low. In July of 1945 it was estimated there were 130,991 persons unemployed. The Essential Work Orders were continued in effect: workers whose jobs were covered by the Orders could not leave without the permission of the Representative of the Ministry of Labor. Exceptions were men of 65 or over and women of 50 or over, workers who had been away three years or more from their homes and could find important work near their homes, and people granted licenses to reopen shops or businesses.

In Canada the draft was ended shortly after the termination of the war with Japan, and other controls such as the compulsory transfer of men to more essential work, and Selective Service restrictions on women, were ended. The sole exception was in agricultural employment where the power to direct male persons between the ages of 16 to 65 was continued until the close of the harvest season in November. Unemployment rose from 3,241 in August, 1944, to 20,557 in August 1945.

Women Workers. When the war ended in August 1945, the number of women in the civilian labor force was estimated at 19½ million, of whom all but about 350,000 were actively employed. In May of 1940 there were approximately 13½ million workers in the labor force, 2 million unemployed

and seeking work. Women workers increased from a fourth of the labor force to a third during the war. It was estimated in 1945 that about 2 million of the employed women were from the group which had been unemployed in 1940, while about 3 million represented war-induced workers such as former housewives or retired workers, and girls leaving school for the purpose of taking jobs. In every group of employees, except domestic service which lost almost ¼ million women, there was a decided increase in employment. There were strikingly significant increases in manufacturing, in which the number of women employees was more than doubled.

A study by the National Industrial Conference Board with reference to the average weekly earnings of women showed the following in May, 1945.

AVERAGE WEEKLY EARNINGS OF WOMEN INDUSTRIAL WORKERS

War Industries	Civilian Industries
Shipbuilding ... \$49.80	Textiles ... \$33.01
Aircraft ... 48.27	Wool ... 28.71
Automobile ... 45.79	Hosiery & knit goods ... 28.71
Iron & Steel ... 42.69	Silk & rayon ... 27.73
Electrical ... 40.16	Cotton, north ... 27.72
Rubber ... 37.82	Meat packing ... 29.87
Tires and Tubes ... 42.17	Boot and Shoe ... 29.01
Other rubber products ... 33.41	Paper products ... 27.29
Chemicals ... 33.68	

The curtailment of war production in August, 1945 affected women about the same as men. Aircraft, ordnance, and shipbuilding showed a sharp decline. Except as to ordnance, there was no indication that women were being laid off in significantly greater proportions than were men. In the ordnance industry, however, women were dropped at a relatively faster rate: 64 percent as against 46.

With the increase of employed women the number enrolled in labor unions increased from the prewar figure of 800,000 to over 3 million by V-J Day. Delegates to a Women's Bureau Trade Union Conference stressed the fact that union protection and benefits to women are needed not only for them, but also as a means of safeguarding the standards of male employees and the interests of all.

Massachusetts passed an Equal Pay Bill which prohibited the payment of a lower wage rate to women than to men for work of comparable character or for work on comparable operations. A bill to the same effect was introduced in Congress, but no action on it had been taken when the year ended. Several states subsequent to V-J Day ended wartime relaxations of limitations on the employment of women.

The Labor Advisory Committee of the Women's Bureau of the Department of Labor urged dissemination of factual information indicating the necessity for employment of women, action toward nation-wide adoption of equal pay for equal work, and the improvement of existing minimum wage legislation.

Child Labor. As in 1944, the number of young workers 14 to 17 years of age working full or part time was estimated at nearly 3,000,000. This figure is to be compared with the 1940 figure of 1,000,000. The corresponding decrease in high school enrollment likewise continued. From 1940 to 1941 the number of high school students reached an all-time high of 7½ million; in 1944 and 1945 it had dropped to slightly below 6 million.

There was, however, a trend toward the reinstatement of legislative limitations on the use of

child labor which had been removed to aid war production. Illinois raised the minimum age for employment during school hours in factories, stores, and other specified establishments and corporations, from 14 to 16 years. Maine raised its 14-year minimum standard for work in factories and other specified establishments to 15. Child labor standards improved in Illinois, New York, Hawaii, Rhode Island, California, and Nebraska. Tightened compulsory school attendance laws were adopted in Georgia, North Carolina, Oregon, and Texas. Seven states, however, continued wartime relaxations.

The Secretary of Labor ordered withdrawal of the 1942 exemption of the 18-year minimum age limit for employment of girls under the Walsh-Healy Act. The exemption had permitted girls of 16 to 17 to be employed under certain conditions. The Children's Bureau of the Department of Labor revoked wartime amendments to Child Labor Regulation No. 3, issued under the Fair Labor Standards Act. Under these amendments, employers in raw shrimp, fresh fruit and vegetable packing houses, and fruit drying houses had been permitted to hire 14 and 15 year old minors. Hazardous Occupations Order No. 5 restricting employment of children on power-driven woodworking machines was likewise restored to its prewar status. A wartime amendment had permitted the use of 16 and 17 year old minors in operating certain machines.

Wages and Working Hours. During the early months of 1945 factory earnings continued at about the same comparatively high rates as in the latter part of 1944. By midsummer, with the end of the Japanese war, factory earnings declined substantially. By October the gross average hourly pay in all manufacturing had dropped below \$1.00, for the first time since December, 1943, to a figure of \$.985. Average weekly earnings declined to \$41.02 in October from \$47.50 in January, 1945. The decline in earnings was attributable to the disappearance of extra shift and overtime pay in heavy industry as well as the general return to a 40-hour week.

Nevertheless, October average weekly earnings of workers in all manufacturing were \$17.83 above the January, 1939, figure or 76.6 percent. Average hourly earnings were approximately 56 percent above the January, 1939, figure of \$.632 per hour

AVERAGE HOURS AND EARNINGS OF FACTORY WORKERS, SELECTED MONTHS, 1939-1945

Month and Year	Weekly Hours	Hourly Earnings	Weekly Earnings
January, 1939	36.7	\$0.632	\$23.19
January, 1940	37.5	.655	24.56
January, 1941	39.0	.683	26.64
January, 1942	41.7	.801	33.40
January, 1943	44.2	.919	40.62
October, 1943	44.4	.968	42.76
January, 1944	45.2	1.002	45.29
October, 1944	45.6	1.031	46.98
January, 1945	45.4	1.047	47.52
October, 1945	41.6	.985	41.02

Source: U. S. Bureau of Labor Statistics

Substantial numbers of workers in textile, food processing, agricultural and service trades continued to receive less than \$.60 per hour. In recognition of this situation several bills were introduced in Congress providing for the raising of the legal minimum wage to \$.65 per hour. These proposals were still awaiting action by the Congress at the year's end. The National War Labor Board amended its rules to permit employers to pay up to \$.55 (instead of \$.50) per hour without Board approval.

Average weekly hours worked in the United

States had dropped to 40.8 in August as compared with 44 in July, 1945, and 45.2 in September, 1944.

The Secretary of Labor established a minimum wage for the cigar and cigarette industry in Puerto Rico of \$.30 per hour. A minimum rate of \$.35 per hour became effective for the sugar industry in that territory. Minimum rates of \$.40 per hour were set in banking, insurance and finance, cement manufacturing, paper box manufacturing, rum and industrial alcohol manufacturing, and shipping.

In Canada weekly earnings in manufacturing averaged \$32.15 in August of 1945 as compared with \$31.63 in August of 1944, \$31.06 in August of 1943, and \$28.62 in August of 1942.

In Britain the first wartime decline in average weekly earnings of manual workers manifested itself during January, 1945. Thus was attributable to the reduction in working time, since average hourly earnings remained the same as in July, 1944. Between October, 1938, and January, 1945, the average increased 76 percent for all classes. Average weekly hours declined from 48.6 in July, 1944, to 47 in January of 1945.

The British Wages Councils Act, designed to insure minimum wage standards, was enacted in March of 1945. The Act established autonomous boards, composed of employee and employer representatives in a particular industry, which were empowered to fix legally enforceable standards. These boards, known as Wages Councils, have also the power to fix a guaranteed wage. Until December, 1950, employers must observe terms and conditions of employment not less favorable than those which were representative of substantial proportions of employers and employees engaged in that trade or industry in the district concerned.

In Luxembourg, minimum wage rates were set for all workers except domestic, agricultural, and house workers. In India, data gathered from several industries showed substantial wage increases for the period from 1939 to 1943. In Italy also increases were granted in specific localities in Central and Southern Italy during the period from November, 1944, to April, 1945. In Switzerland, although the wage index had advanced 42 points over 1939, real wages had dropped to 93, by the index in January and March of 1945.

Strikes. With the close of war in mid-1945, the United States experienced not only an increased number of strikes but also strikes of greater duration than those in the wartime years. The major ones were motivated by the decline in take-home pay and labor's demand for a corresponding increase of 30 percent in wages.

Illustrative were the strikes of the CIO Oil Workers Union which initiated the 30 percent demand; this was terminated by the Government's seizure of the struck companies. In November the United Automobile Workers, CIO, struck to obtain a 30 percent increase from General Motors, after indicating its strike strategy would be to initiate strikes against each of the large automobile producers singly. The United Steelworkers set a strike date for early in January which would involve 700,000 workers in all branches of the steel industry.

For the whole year 1945 the number of strikes was several hundred below the 5,000 reported in 1944. But the working time lost multiplied more than four times. The figure for man-days of idleness was 8,721,000 in 1944, as compared with about 35,000,000 in 1945. The number of workers involved in strikes increased more than a third between the two years.

In Great Britain the number of strikes was about

the same as in 1944, but the number of workers involved and time lost decreased.

In Canada, however, strikes did not increase, and the number of workers involved, also, was not significantly greater than in 1944. But duration of strikes and working time lost rose greatly. In the first ten months of 1945 man-days of idleness caused by strikes were 64 percent above the corresponding ten months of 1944. The most serious Canadian strike during the year involved a work stoppage of four months at the Ford Motor Company plant in Windsor, Ontario, involving 12,000 workers.

Australia, despite its compulsory arbitration laws, had its three most important industries—steel, mining, and shipping—all but paralyzed by strikes.

STRIKES IN UNITED STATES, CANADA AND GREAT BRITAIN, 1940 TO 1945

Country and Year	Strikes	Workers Involved	Man-Days Idle
<i>United States *</i>			
1945 *	4,600	3,325,000	35,000,000
1944	4,956	2,115,600	8,721,000
1943	3,752	1,980,000	13,500,000
1942	2,968	840,000	4,180,000
1941	4,288	2,360,000	23,050,000
1940	2,508	577,000	6,700,000
<i>Canada *</i>			
1945 *	182	90,509	1,478,811
1944	189	77,700	502,000
1943	402	218,400	1,040,000
1942	354	114,000	450,000
1941	231	87,000	434,000
1940	168	60,000	266,000
<i>Great Britain *</i>			
1945 *	2,282	530,000	2,830,000
1944	2,185	850,000	3,700,000

Collective Bargaining and Government Control. In August, immediately after V-J Day, President Truman announced that greater emphasis would henceforth be placed on collective bargaining and the War Labor Board would be terminated as soon as possible. At the same time Executive Order 9599 was issued permitting the granting of wage or salary increases without War Labor Board approval, on condition that price changes or increases in costs to contracting government agencies were not involved. If price changes or increases in costs to the Government were involved, approval was required; the approved wage adjustments were then to be taken into account by the Office of Price Administration in allowing price adjustments.

In the latter part of October, in response to complaints that the Government's wage and price policy was unclear, and in view of increasing labor disturbances arising over labor's demand for 30 percent wage increases to offset losses in take-home pay, Executive Order 9651 was issued. Employers were permitted to make wage or salary increases without waiting for approval even if price adjustments were considered necessary to offset the newly granted increases. If approval were asked and obtained from the War Labor Board, OPA was required to give immediate attention to granting appropriate price relief. Where wages were raised without prior approval, a period of six months was set before the employer might ask for price relief. The Order empowered the War Labor Board to approve wage increases in three new classes of cases: (1) Where the percentage of increase in

average straight time and hourly earnings since January, 1941, was not equal to the increase in cost of living between January, 1941, and September, 1945 (33 percent was officially announced as the cost of living increase in this period). (2) Where increases were necessary to correct inequities in wage rates or salaries among plants in the same industry or locality with due regard to normal competitive relationships. (3) Where increases were necessary to insure full production in an industry designated by the Stabilization Administrator as essential to reconversion and in which existing wage rates or salaries were inadequate to the recruitment of needed manpower.

In November the President convened in Washington a National Labor-Management Conference. Despite a message from President Truman stressing the urgency of agreement upon machinery for the settlement of industrial disputes, no agreement was reached with reference to this problem. The Conference adopted recommendations that expeditious collective bargaining be undertaken in initial contract cases under orderly procedures; that the United States Conciliation Service be strengthened and enlarged; that grievances arising under labor contracts and disputes concerning the interpretation of the contracts should be settled by voluntary arbitration; and that there should be no discrimination in employment because of race, creed, color, or national origin.

The War Labor Board went out of existence at the end of the year. Its dispute functions were taken over by the Conciliation Service of the Department of Labor, supplemented by Fact Finding Boards which the President asked Congress to authorize by legislation. A tripartite Stabilization Board was also set up in the Department of Labor to take over the duties of the War Labor Board relating to requests for approval of wage adjustments involving either price relief or wage decreases.

In Great Britain it was determined that labor controls would be continued for five years. The Conditions of Employment and National Arbitration Order was continued in effect. Under this order strikes or lockouts are illegal unless a dispute has been referred to the Minister of Labour and he has not settled it or referred it to arbitration within 21 days after reference to him. The Minister may refer the dispute to a body chosen by the parties or to the wartime National Arbitration Tribunal. In either case, the decision is compulsory. All employers are required to observe the terms and conditions operating in each district. This generally means the terms and conditions contained in collective bargaining agreements.

In Canada wage controls were continued but manpower controls were eliminated.

Labor Movements. In the United States, due to transportation difficulties, no conventions were held by the AFL or the CIO during the year.

In January, 1945, some 14½ million workers in the United States were employed under collective bargaining contracts. These workers included approximately 47 percent of all workers employed in industry in occupations in which unions are actively engaged in obtaining written agreements with employers. There were approximately 30½ million employees in such occupations. About 8½ million production wage-earners in manufacturing industries were employed under the terms of union agreements at the beginning of 1945, or approximately 65 percent of all production wage-earners; an increase for the year 1944 of about 8 percent in the proportion of employees working under union

agreements. Approximately 33 percent, or slightly more than 5½ million employees, of all non-manufacturing workers were employed under the terms of union agreements at the beginning of 1945, representing an increase during the year of 6 percent in the proportion of employees working under agreements.

By January, 1945, approximately 27 percent (3½ million) of all persons employed under union agreements were employed under maintenance of membership clauses, representing an increase during the year 1944 of almost 23 percent in the proportion of workers under such agreements. About 28 percent (4 million) of all workers under agreements were employed under closed shop agreements, and about 18 percent (2½ million) under union shop agreements. About 28 percent of the proportion of workers under agreements were covered by some form of check-off provisions.

In September, 1945, the British Trades Union Congress held its 77th annual conference at Blackpool, England. The Congress represents approximately 6 million workers. Resolutions were adopted or presented for adoption of the 40-hour week "in stages appropriate to the circumstances of each industry," urging continuation of the system of shop steward and joint production committees established for wartime purposes, seeking assurance from the Government that temporary surplus workers should not be used for the purpose of lowering wages, recommending establishment of a guaranteed weekly wage, recommending enforcement of all negotiated wage agreements and the payment of "rate on the job" in all government employment with establishment of a similar basic rate for men and women, recommending the stepping up of the rate of discharge of men and women from the Armed Services, and recognizing the right of farm workers to wages and conditions obtaining in other skilled industries.

The International Federation of Trade Unions met in the early part of 1945. The General Council refused to favor a change in its constitution permitting the CIO and Russian trade unions to enter the Federation, but delayed final action on the proposal. In December the Federation ended its existence of 40 years. The AFL which had opposed entry of CIO and Russians was not present at the final meeting.

In February, 1945, a World Labor Conference called by the British Trades Union Congress met in London. After some opposition, unions of former enemy countries such as Bulgaria, Roumania, Italy and Finland were admitted to the Conference. The CIO and the Russian trade unions were represented. The AFL refused an invitation to attend. A committee was appointed to draft a constitution for the establishment of a new World Federation of Trade Unions. The Conference asked for labor representation at the San Francisco Conference to set up the United Nations Organization. The AFL attacked the new body as fostering a dual world unionism.

Late in September the World Federation of Trade Unions met in Paris. The Conference lasted 8 days. Delegates from fifty-six countries attended the Conference representing approximately 66 million people. A constitution was adopted which provided for biennial meetings of the Congress, that all trade union organizations were to be accepted without discrimination, and that there should be established a General Council with a representative from every affiliated organization which would meet annually. The AFL did not participate and refused to join the organization.

In the latter part of October and early November

the annual International Labor Organization Conference was held at Paris. Motions were adopted clearing the way for affiliation with the United Nations Organization, and it was determined that an appropriate place would be sought for the ILO in that organization. The San Francisco Conference had taken no direct action with respect to the ILO but adopted a general provision under which "the various specialized agencies, established by inter-governmental agreement and having wide international responsibilities" are to be brought within the United Nations Organization through negotiation with the Economic and Social Council.

At the ILO Paris Conference various constitutional amendments were proposed which would change the method of representation which now consists of 2 government delegates, one workers' delegate and one employers' delegate, from each country. The French and Belgian representatives proposed that there be 2 representatives from each of these groups, while the Latin American countries sponsored an amendment which would increase the number of workers' delegates by one. Employer groups opposed the proposed amendments. The Conference agreed to submit the proposed amendments to the 1946 Conference after comment by the member governments. Italy was admitted to membership.

In Belgium, more than 900 delegates of 4 important labor movements gathered at a Congress of Unity in Brussels in April and voted to unite in a single General Federation of Labor. The Congress adopted a program stressing the duty of the labor movement to obtain favorable working conditions, including a minimum wage based on "needs of contemporary civilization," limitation of working hours, health and safety legislation and special protection for women and youth, organization of apprenticeship with the collaboration of unions, and comprehensive social security.

In Bulgaria it was reported that as of May, 1945, there were about 350,000 trade union members as contrasted with 162,000 in 1939. The Executive Committee of the Italian General Confederation of Labor met in April, 1945, and adopted resolutions favoring the adoption of a sliding scale of wages based on the cost of living, equal pay for equal work for men and women, labor representation and advisory committees to be established to assist various ministries of the government, and proportional representation for labor in the National Consultative Assembly which the government was to establish.

In France the participation of labor in the management of industrial and commercial undertakings was begun by governmental decree. In all industrial and commercial undertakings employing more than 100 persons, a shop or office committee was established consisting of the employer and a maximum of 8 delegates elected by the workers. The committee was to have the power of binding decisions in matters affecting the welfare of the workers, but only the power of suggestion in questions affecting management, under a decree issued by the French Government. It was reported there were approximately 4 million members of labor unions in France.

Paraguay reported that the membership of legally constituted trade unions at the beginning of 1945 was 10,699.

In Germany trade unions were permitted to function in each of the 4 zones occupied by the Allied powers. A suggestion to the Allied Control Council that trade unions be allowed to organize on a national basis was defeated by French objection.

Federal Labor Legislation. A rider to the Deficiency Appropriation Bill passed by Congress in December, 1945, stopped the National Labor Relations Board from taking strike votes as provided by the (Smith-Connally) War Labor Disputes Act of 1943. The law remained in effect, however, and the requirement that representatives of labor organizations shall file with the Government notices of intention to strike is still in effect. A bill to repeal the law was introduced in Congress by one of its authors, Mr. Smith, and this was later amended by the House Military Affairs Committee to prohibit financial contributions by labor unions in connection with Federal elections, primaries and political conventions, as well as to penalize unions for striking in violation of agreements which contain a no-strike provision. But a rule calling up the bill for consideration, as so amended, was defeated in the House of Representatives.

Another rider to an appropriation law provided that the United States Employment Service, which had been federalized during the war, be returned to the states within 100 days. This was attached to an Act adopted by both houses of Congress rescinding certain war appropriations for government agencies. But President Truman vetoed the Act because he was opposed to returning the Employment Service to the states for another year at least, and also because he objected to legislation by means of riders to appropriations.

The Hobbs bill amending the Copeland Anti-Racketeering Act to remove exemption of certain labor union activity was passed by the House. The Anti-Racketeering law makes it a felony for any one acting in concert with others to interfere with interstate commerce by obtaining, or attempting to obtain, by force or threat of force the payment of money or other valuable consideration . . . not including, however, the payment of wages by a bona fide employer to a bona fide employee." In *U.S. v. Local 807*, the Supreme Court held that certain activities of a labor union were not within the scope of the Anti-Racketeering Act because of the above-quoted language. In that case members of the union met non-union trucks entering New York City and insisted on the trucks being turned over to union members to drive for the part of the trip within the city. If non-union truck drivers refused, the trucks were held up until union wages were paid to the union members even though their services in driving the trucks were not accepted. The Court found that the exception made for payment of wages to a bona fide employer to a bona fide employee covered this situation. At the end of the year the Hobbs amendment was awaiting action by the Senate.

Both a Senate and a House committee held extended hearings on proposed amendments to the Fair Labor Standards Act that would increase the legal minimum wage from 40 to 65 cents an hour, but at the year's end neither committee had yet reported its recommendations. A Supreme Court decision interpreting the Fair Labor Standards Act, held that although an employee voluntarily accepted a settlement of a claim for overtime pay, and released the employer from further claims, this did not bar later claims for unpaid damages under the Act (*Brooklyn Savings Bank v. O'Neill*).

Although the President had repeatedly requested that Congress take action on a pending bill to establish a Fair Labor Practice Commission for the purpose of preventing discrimination in employment on account of race, creed, color or national origin, the bill was held up by a committee which refused to report it out. A petition to relieve the

committee of the bill and bring it before the House of Representatives for action was being circulated, but lacked sufficient signatures when Congress adjourned for the Christmas and New Year holidays. Two states, however, New York and New Jersey, did adopt such anti-discrimination laws. In addition, Indiana and Wisconsin enacted laws authorizing their state labor departments to hear complaints of such discrimination, and to make recommendations and publicize their findings. In Utah a legislative committee was appointed to investigate discrimination on account of race, creed and color, and to recommend legislation. The Supreme Court of the United States ruled in *Railway Mail Association v. Corsi*, that the New York State anti-discrimination law did not violate any provision of the Federal constitution.

Pursuant to a Congressional message from President Truman, identical bills were introduced in the Senate and House providing for appointment of fact finding boards by the President in disputes affecting the national interest. These bills authorize the President to appoint impartial "Fact Finding Boards" to investigate unsettled labor disputes which are certified to him by the Secretary of Labor as seriously threatening to public interests. The boards are to make findings of fact and recommendations within 20 days after their appointment, and they are given power to subpoena persons and records. For 30 days after the Secretary of Labor certifies a dispute to the President the parties may not strike or lockout. If a work stoppage is in effect at the time of certification, operations must be resumed, but no penalties are provided for violation of the 30-day "cooling off" period.

The President requested enactment of this legislation before Christmas, but Congress adjourned before committee hearings were completed. The committees decided to extend the scope of the hearings to include other bills which had been introduced to deal with the strike problem and methods of settling industrial disputes. Most important of these were: (1) the Hatch-Ball-Burton bill which would drastically amend the National Labor Relations Act, set up statutory agencies in the Department of Labor for mediating disputes, and provide for compulsory arbitration in cases where interruption of essential public services are involved; (2) a bill submitted by Senator McMahon of Connecticut to establish the Conciliation Division of the Department of Labor on a statutory basis, create a Board of Arbitration, and provide for temporary Boards of Inquiry for fact finding purposes.

During the year Hawaii and Puerto Rico adopted comprehensive labor relations laws prohibiting unfair labor practices by labor unions as well as by employers. Connecticut enacted a "Little Wagner Act" modelled after the National Labor Relations Act. A so-called "right to work" law making illegal virtually every type of union security provision was passed by the legislature of the State of South Dakota. The Colorado Supreme Court held unconstitutional provisions of the Colorado Labor Peace Act requiring labor unions to incorporate, and making unlawful strikes not authorized by a majority vote in a secret ballot. And the U.S. Supreme Court declared unconstitutional a Florida statute providing for licensing of union business agents, as well as a section of a Texas law regulating unions which required union organizers to get registration cards from the Secretary of State before soliciting members for a union, and barring aliens from acting as labor organizers.

The Sherman Anti-Trust Act was interpreted by

the Supreme Court as being applicable to labor unions where such organizations aid and abet employers in procuring a monopoly (*Allen Bradley Company v. Local Union No. 3, IBEW*). In another case under this Act, a union was held to be within its rights when it refused to permit its members to work for a trucking company as a result of a labor dispute, and refused to admit to membership anyone who did work for this employer, although the company was put out of business by the union's policy (*Hunt v. Crumboch*).

WILLIAM M. LEISERSON.

LABOR STANDARDS, Division of. A Division of the U.S. Department of Labor, organized in 1934, authorized to develop desirable labor standards and to make specific recommendations to improve working conditions and the economic position of wage earners. Director in 1945: Verne A. Zimmer.

LABOR STATISTICS, Bureau of. A Bureau of the U.S. Department of Labor, established in 1913, charged with the duty of acquiring and diffusing information on subjects connected with labor. Information is issued in special bulletins and in the *Monthly Labor Review*. The Commissioner of Labor Statistics in 1945 was Isador Lubin (A. F. Hinrichs, Acting).

LABOR, U.S. Department of. A Department of the U.S. Government which in 1945 consisted of the following principal bureaus and divisions:

Bureau of Labor Statistics
Children's Bureau
Division of Labor Standards
U.S. Conciliation Service
Wage and Hour and Public Contract Divisions
Women's Bureau

Special wartime organizations functioning within the Department are the National Committee for Conservation of Manpower in War Industries and the National Advisory Committee on Working Conditions.

See the articles on the separate branches and, for reports compiled within the Department, CONSUMERS' COOPERATIVES; JUVENILE DELINQUENCY; LIVING COSTS, ETC. Secretary of Labor: Lewis B. Schwellenbach.

LACROSSE. United States Intercollegiate Association teams put on many interesting games last season, but one of the greatest contests in years was the big battle at Annapolis, Md., where those old service rivals, Army and Navy, fought to a 7-7 deadlock in an overtime thriller. Both teams had swept aside all other college opposition with the result that the tie left them as co-owners of the Wingate Trophy, emblematic of the intercollegiate title that the Cadets had won outright in 1944.

The Hopkins L. C. of Baltimore proved best of the club tens, a 10-7 decision over powerful Army being the highlight of its campaign.

THOMAS V. HANEY.

LAND UTILIZATION, Office of. An office of the U.S. Department of the Interior, created in 1940, which coordinates and integrates the land use and management activities of the Department. Assistant to the Secretary in charge of Land Utilization: Lee Muck.

LATIN AMERICAN ART. Interchange of art exhibits among the American Nations was recognized as an important factor in intellectual collaboration, in a

convention signed at Buenos Aires by delegates of all the American Republics in 1936. As expressed in that reunion, the nations of the Western Hemisphere were "desirous of improving their spiritual relations through a better acquaintance with their respective artistic creations." Thus intellectual interchange was given, in the Americas, a coordinate place with the peaceful settlement of international disputes, non-intervention, the outlawry of force, the observance of treaties, and the precepts of international law.

Individual governments in various Latin American countries have long fostered art by supporting free national schools, and giving fellowships for study abroad to talented students. Thanks to these favorable circumstances, painting, sculpture, and all forms of esthetic expression have found a fertile ground in Latin American soil, and today many works of art by South and Central Americans are in the museums and private collections of Europe and North America.

Government-fostered art and international exhibitions have encouraged artists to play on national or indigenous themes, portraying customs and typical scenery, thus enhancing the value of cultural interchange.

The outstanding Latin American painters of today are those of the several Mexican schools, Diego Rivera, José Clemente Oroscó, and David A. Siqueiros. The influence of Rivera and Oroscó is apparent in much of the art from the Rio Grande to Tierra del Fuego. While the Mexican revolutionary artists headed a rebirth of the ancient Aztec, Tarascan, and Zapotecan art, a similar revival of native lost arts, such as the Inca of Perú, the Aymará of Bolivia, the Chibcha of Colombia, was patterned after the Mexican Renaissance and developed in those countries where native Indian civilizations flourished before the Spanish and Portuguese conquests.

In the opinion of one advanced Latin American editor, Rivera and Oroscó are the "precursors" of a modern Latin American Renaissance. Like the early painters in Italy whose works did not reach the status of "masterpieces," but who definitely established a trend in painting that divorced the art of their contemporaries from the static Byzantine patterns, and later paved the way for the great masters, Raphael, Tintoretto, Michael Angelo and Leonardo da Vinci, the modern Mexican painters may have set a pattern for the development of Latin American art. Through the work of this school and its large following, that art will have a definite character distinguishing it from the European, even though it has not yet attained its full expression and the great masters are yet to come.

Although this theory may seem sacrilegious to those critics who have long held the paintings of the Mexican revolutionaries to be modern masterpieces, the balanced critic will consider the murals of Rivera, the canvasses of Charlot, and the drawings of Oroscó, as steps rather than the finished products of this artistic evolution.

As in most of Latin America, colonial art in Mexico followed a European model, particularly Hispanic. In the early days of the vice-royalty, the San Carlos Academy was established in Mexico City. Artists who came from Europe, and Mexicans, some of whom went abroad for training, introduced successive foreign styles. Though indigenous forms then received little conscious attention, all of the imported styles were more or less affected by local scenery, customs and a regional viewpoint. It was as though the importations were translated into the vernacular.

However, it was not till the twentieth century that the treatment of the Indian motif and the national theme received full recognition, in an artistic revolt that followed the political upheavals and was headed by Carlos Mérida and Diego Rivera, and later followed by Jean Charlot.

Many of today's younger Mexican painters, such as Luis Arenal, Federico Cantú, José Gutiérrez, Pablo O'Higgins, and Conrado Vasquez, were at one time helpers to Rivera and Siqueiros, in the same fashion as the old Italian masters served their apprenticeship under famous painters of their time. Many others, both in Mexico and in other parts of Latin America, have consciously imitated or unwittingly let themselves be influenced by the Mexican school.

The increased use of Indian motives from primitive arts and folklore that may be observed in the modern school of Bolivia bears a strong resemblance to the Mexican revival, with the Aymará substituted for the Aztec, such as the paintings of Cecilio Guzmán Rojas and Víctor Cuevas Pabón. These artists not only turn away from the classics in the selection of themes, but they follow the revolutionary undercurrent in their simplification of anatomy and their combination of colors.

This general trend toward stylization may be observed as well in various other countries, in diverse interpretations, as José Sabogal of Perú, Luis Alberto Acuña of Colombia, Tomás Santa Rosa of Brazil and José Mejía Vides of El Salvador.

Sabogal is considered by Waldo Frank to be the equal of Rivera in Perú, the creator of a distinctively Peruvian school. There too the impress of Europe was strong on native painting in early colonial times. Since artists found in the Church their best patron, sacred themes naturally predominated. The early years of the republic in Perú produced two painters of rank, Merino and Lazo. The early twentieth century had its foremost exponent in Daniel Hernández, who in 1918 became the founder of the government-sponsored National School of Fine Arts. Since then there has developed a movement to make use of the modern idioms in painting, of which Enrique Camino Brent and José Sabogal are excellent examples.

A similar development of art from colonial times to the twentieth century may be traced in almost any Latin American country, with few exceptions. In Colombia, although European ideas, mainly Hispanic, were implanted in painting, colonial art had nevertheless a strong local character. Imported ideas from overseas were generally adapted to the taste of the people and to the highland environment. Today art thrives in Colombia. Several styles ranging from the neo-classical to impressionism are being cultivated, and among the most notable of Colombian painters are Luis Alberto Acuña and Ignacio Gómez Jaramillo, who studied the Mexican art movement on behalf of the Colombian Government. Gómez Jaramillo painted the murals of the Teatro Colón in Bogotá.

Many different schools of painting have taken root in Argentina. Today Buenos Aires is the center of lavish artistic production, both by native and foreign artists. The vivid country scenes of Fidel de Lucía, in an imposing color array, contrast with the still lives of Héctor Basildua, who, as artistic director of the Colón Theater in Buenos Aires, has developed the theatrical scenery, costumes and decorations for more than fifty ballets and operas. There are excellent portrait artists such as Cesáreo Bernaldo de Quirós, Antonio Berni and Ramón Gómez Cornet, as well as interpreters of local customs like Florencio Molina Campos.

Molina developed a technique in a combination of water colors and tempera. Now he works in oils. His animated landscapes of the endlessly flat Argentine pampas are so original, so grotesque and yet so life-like, that they command the admiration of both the critic and the untutored. Molina Campos is a satirist. His characters are all grotesque; his horses have quasi-human expressions. Yet he is so comprehensive in depicting the joys and sorrows of the "gaucho" of the pampas, that his real life characters, far from feeling caricatured or ridiculed, see themselves mirrored in his canvasses.

Painting in Uruguay, as in neighboring Argentina, has grown in sparkle and virility in the twentieth century, and there also numerous followers of all schools practise and exhibit at the *Círculo de Bellas Artes*. Notable among Uruguayan artists of today are César A. Pesce Castro, whose anatomical studies at the medical school, prior to his study of painting, gave him a broad foundation, which so many modern artists lack or ignore, and Carmelo de Arzadún, who depicts rural scenes of his native country. Pesce Castro has been director of the National Museum of Fine Arts at Montevideo.

Among the new generation of Brazilian painters are portraitists like Leopoldo Gotuzzo, landscapists as Funchal Garcia, Vicente Leite or José Pancetti, and followers of the modern schools—Lucy Citti Ferreira, Tomás Santa Rosa, Jr. and Orlando Teruz. The modernist tendencies in Brazilian art have been given official recognition. Rio de Janeiro, however, home of the National School of Fine Arts and the National Museum, still clings tenaciously to tradition, while São Paulo shelters the young artists who strive for short cuts to art and new points of view. The two clashing ideologies seem to agree on one point—the use of indigenous symbolism and the preponderance of national themes.

Chile, Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, Panamá, Nicaragua, the Dominican Republic, Venezuela, Paraguay, and Puerto Rico, each have their outstanding artists, with many racial backgrounds, each with his own particular individuality.

In Chile, the Academy of Painting was established as early as 1849. Notable painters of that country include Benito Revollo C., whose symbolic paintings have a social commentator's viewpoint, Pablo Burchard, sculptor and portraitist, and Jorge Caballero, director of the Museum of Fine Arts in Santiago. Costa Rica's Manuel de la Cruz González and Esmeralda Lorin de Povedano, are outstanding among a select group, while in Cuba the rich tropical scenery of the island has its foremost interpreters in Domingo Ramos, Antonio Rodríguez Morey and Leopoldo Romañach. The latter is the classical master of Cuban painters.

Ecuador has produced Bolívar Ollague, Enrique Gómez Jurado, Pedro León D., and Sergio Guarderas, whose village scenes won him the first prize in the Latin American Exposition of Fine Arts in Viña del Mar, Chile, in 1938.

In Central America, various artistic trends may be discovered in each country, as in the canvasses of Salvador Salazar Arrué, known as "Salarrué," from the Republic of El Salvador, who originated a style of his own which he called "indian tapestries," or his compatriot José Mejía Vides. Alfredo Gálvez Suárez of Guatemala is notable for his portraits of indigenous characters, while the Guatemalan Carlos Mérida is of the modernist school, painting strange forms in rich color contrasts. Carlos Zúñiga Figueroa and Maximiliano Euceda of Honduras, Ernesto Brown, Jr., of Nicaragua,

Humberto Ivaldi of Panamá, comprise a legion of younger artists who are well known throughout their five small republics.

In Paraguay art instruction is compulsory in the primary and high schools. Pablo Alborno organized the Asunción Academy of Fine Arts and painted the portraits of many heroes of the country's struggle for independence. Jaime Bestard's scenes of rural life have won him acclaim.

The Dominican Republic, though small, has produced several noteworthy artists. Among the moderns is José O. Morel, generally considered the representative painter of the Republic, Celeste Wos y Gil, and Rafael D. Palacios.

Modern Venezuelan paintings seem to have a preponderance of landscapes. There is also a marked tendency to the portrayal of native types and the national scene. Foremost among painters of today are Tito Salas, of the modern school, Luis Alfredo López Méndez, Cruz Alvarez Sales, Francisco Narváez, who is a sculptor as well, and Héctor Poleo.

Puerto Rico belongs with Latin America, since this island has the same artistic heritage as the neighboring Hispanic-American Republics, though politically a part of the United States. The first independent exhibition of Puerto Rican art, in 1936, gave evidence of the progressive spirit which animates the island's painters, such as Rafael Ríos Rey, modernist, Cesar Bulbeno, who has devoted himself to murals, Miguel Pou, portraitist, and Luisa Geigel, both a painter and sculptor.

In caricature Latin American art ranks with the best.

Sebastián Robles, of Perú, can draw from memory several hundred international personalities by exaggerating one or two of their more prominent features; Miguel Covarrubias of Mexico, uses pastels or water colors for his famous full color caricatures; and Conrado Massaguer of Cuba, is known for a contagious artistic sense of humor.

ANTONIO J. CÁRDENAS.

LATIN AMERICAN LITERATURE. The outstanding and most heartwarming literary event of the year for Latin America was the award of the Nobel Prize for Literature to Gabriela Mistral, the first time this award has been made to a Latin American. Gabriela Mistral is the pen name of Lucila Godoy Alcayaga, who was born in Vicuña, Chile, in 1889. In 1915, the first prize in a poetry contest in Santiago was won by her *Sonetos de la muerte*, whose rugged directness of emotion and poetic imagery marked a turning point in Chilean poetry. The first collection of her poems, *Desolación*, was published in 1922 by the Instituto de las Españas in New York. A second volume of poetry, *Ternura*, was published in 1924 in Madrid, and a third volume, *Tala*, in Buenos Aires in 1938. Her prose (*Lecturas para mujeres*, Mexico, 1923) is no less distinguished than her poetry, and all her literary work mirrors her strong, passionate, and compassionate nature. Her voice is raised in defense of children, women, the poor and oppressed of all races and all nations. It is not dainty, facile verse that she writes, but elemental poetry, as if hewn from stone.

Like many other Latin American writers, Gabriela Mistral has had a distinguished career of public service. Because of her years of devotion to education, she was invited to go to Mexico to aid in the reorganization of the rural schools in 1922. In 1931 and 1932, she taught at Barnard College, Middlebury College, and the University of Puerto Rico. A delegate to many international conferences,

she became Secretary of the Institute for Intellectual Cooperation of the League of Nations. She has served as Chilean Consul in Europe and in Brazil. Her writing, and her whole life, reveal one of the noblest figures of our time.

The most auspicious publishing venture of the year is the Colección Tierra Firme, published in Mexico by the Fondo de Cultura Económica, a literary trust fund. The Colección proposes to make an objective study of all phases of Latin American life and history, commissioning books by the most eminent authorities in each country. So far, in 1944 and 1945, an impressive beginning has been made in studies by such critics as Sanín Cano, Jiménez Rueda, Picón-Salas, Gilberto Freyre, Medardo Vitier, and Germán Arciniegas.

Three original works and five translations of Latin American literature, published in the United States, are worthy of note. *Literary Currents in Hispanic America*, by the distinguished Dominican critic, Pedro Henríquez Ureña, is an informative and creative study of four centuries of culture. Erico Verissimo's *Brazilian Literature: An Outline* is a witty and succinct introduction to modern Brazilian literature. Jefferson Rea Spell's *Contemporary Spanish American Fiction* is a useful compilation of biographical facts about ten prose writers of the twentieth century: Gálvez, Azuela, Loveira, Barrios, Horacio Quiroga, Rivera, Güiraldes, Rómulo Gallegos, Icaza, and Ciro Alegria, with synopses of their works.

The translations are *Knights of the Cape*, from the *Tradiciones peruanas* of Ricardo de la Palma; Ricardo Rojas' *San Martín: Knight of the Andes*, a definitive biography by the great Argentine historian and critic; Jorge Amado's *The Violent Land*; Alfredo d'Escagnolle Taunay's late nineteenth-century romantic novel, *Inocência*, and Adolfo Costa du Rels' *Bewitched Lands*, a novel of the Bolivian Chaco.

A great loss to Spanish American literature was the death, in June, 1944, of Enrique Díez-Canedo, Ambassador of the Spanish Republic to several Spanish American countries, and a political exile in Mexico since the advent of Franco. A zealous and perceptive student of Spanish American literature for many years, Díez-Canedo left a fitting summary of his critical work in his posthumous *Letras de América*.

Argentina. The Premio Sur was awarded to Roberto Ledesma for two volumes of poetry, *Tiempo sin ceniza* and *Nivel del cielo*. Other noteworthy books of poems are Jorge Calvetti's *Fundación en el cielo*, Arturo Serrano Plaja's *Versos de guerra y paz*, and J. R. Wilcock's *Ensayos de poesía lírica*. Worthy of special comment is the abundance of fine poetry that has appeared in the review, *Sur*.

In prose, *El pensamiento vivo de San Martín* is a summary of the thinking of Argentina's national hero, made by one of the most vital critics of modern Argentina, Arturo Capdevila. Manuel Gálvez's *Vida de Sarmiento* reveals less of Sarmiento's greatness than of his biographer's limitations as thinker and philosopher. Ricardo Rojas' *El profeta de la pampa: vida de Sarmiento* is a definitive life of the teacher-president by one of Argentina's most distinguished historians. Diego Manuel Sequeira's *Rubén Darío criollo* is an important biography of the great Nicaraguan poet. The Comisión Nacional de Cultura gave its first award to *Rodeada está de sueño*, a volume of prose poems by Eduardo Mallea, one of the most distinguished stylists in America. The Sociedad Argentina de Escritores awarded the Gran Premio de Literatura to *Ficciones*, in which another of America's great stylists

in prose and poetry, Jorge Luis Borges, has collected his short stories of the past decade. Manuel Peyrou's *La espada dormida*, a remarkable volume of detective stories, won the Premio Municipal de Literatura. Alberto Córdoba's *Don Silento* is in the great tradition of gaucho literature. Arturo Canela's *Historia funambulesca del profesor Landormy* is a fantastic novel, written by a master of irony. Two psychological novels, both revealing promising talent, are Sylvia Bullrich Palenque's *La tercera visión* and Estela Canto's *El muro de mármol*. Adolfo Bioy Casares has repeated his triumph of *La invención de Morel* (1940) with another brilliant, fantastic novel, *Plan de evasión*.

Bolivia. Augusto Guzmán's *Tupaj Katari* (Colección Tierra Firme) is a novelized account of the eighteenth-century revolt led by José Julián Apasa. Alfonso Crespo's *Santa Cruz, el cóndor indio* (Colección Tierra Firme) is a biography of the Bolivian general and statesman, Andrés Santa Cruz. In his novel, *Oro del Inca*, Luis Toro Ramallo describes the desperate plight of the Bolivian Indians.

Brazil. A great loss to Brazilian literary and artistic life was the death of Mario de Andrade. Poet, critic, novelist, and one of the most dynamic figures in Brazilian literature, Andrade was one of the prime movers in the renaissance of painting and literature in the 1920's. His *Amar, verbo intransitivo*, one of the landmarks in the Brazilian novel, was translated into English as *Fraulein* in 1933.

Among works of criticism are Diogo de Melo Meneses' biography of Gilberto Freyre, Brazil's most noted ethnographer and social historian, and the author of *Interpretación del Brasil* (Colección Tierra Firme). Pedro Calmon's *Historia do Brasil na poesia do povo* is an interpretation of Brazilian history through the medium of folk-poetry. Astrogildo Pereira's *Interpretações* is the first published book of a critic whose social essays have appeared for many years in magazines. In his *Letras de província*, Moysés Vellinho writes of regional literature in Rio Grande do Sol. Mario Sette's *Maxabombas e maracatus* is a re-creation of the social life and traditions of Pernambuco in 1900. In *Las poblaciones del Brasil* (Colección Tierra Firme), Arthur Ramos, a leading social anthropologist, analyzes racial mixture in Brazil. *Escrutores antillanos* is a study of eight West Indian authors by Silvio Júlio, the most eminent Brazilian authority on Spanish American literature.

Chile. The Premio Nacional de Literatura, which has previously been awarded to three of Chile's major novelists, Augusto D'Halmar, Joaquín Edwards Bello, and Mariano Latorre, was awarded this year to one of her very great poets, Pablo Neruda. The Atenea prize for fiction went to Rafael Maluenda for his *Armiño negro*, and to Remaldo Lumboy for his *Ranquil*.

Two notable works of criticism are *Vida y poesía de Rubén Darío*, the most complete biography and critical study of Darío, written by the famous Chilean poet and critic, Arturo Torres-Rioseco, and Domingo Meli's *El viaje literario*, critical studies by one of Chile's finest scholars.

Four volumes of poetry and one anthology should be mentioned: Rosamel del Valle's *Orfeo*, Pedro Prado's *Esta bella ciudad envenenada*, Oscar Castro's *Reconquista del hombre*, Humberto Díaz Casanueva's *Requiem*, and Alberto Lefevre's *Poetas chilenos*.

Oscar Castro, in *La sombra de las cumbres*, added to his fine reputation as a *cuentista*. Also noteworthy are Luz de Viana's *No sirve la luna blanca*, five stories superbly written, with a delicate, impressionistic style; Dinka de Villaroel's

Norte adentro: en tierra de Cunzas, about the Chilean nitrate fields; María de Clarés' *Cuando el agua es clara*, a first novel of rural Chile; Rafael Fernández Rodríguez's *Tierras de Pedro Ramírez*, on the Colchagua region; Mila Oyarzún's *Cartas a una sombra*, a short novel, in poetic prose, filled with the foreboding of death, and Francisco Coloane's *Golfo de penas*, four *relatos* whose style though uneven, is exciting and imaginative.

Colombia. Three volumes in the Colección Tierra Firme are by Colombian authorities: *Letras colombianas*, by Baldomero Sanín Cano, the dean of Colombian literary critics; Nicolás García Samudio's *La independencia hispanoamericana*, stressing the influence of our Declaration of Independence on Spanish American thought; *Este pueblo de América*, a study of the role of the common man in American history, by Germán Arciniegas, the most influential of Colombia's younger critics, who also wrote *Biografía del Caribe*. Aquilino Villegas' *Las letras y los hombres* is a posthumous collection of literary essays, and Ricardo Jaramillo Arango's *Al roce de los años* a charming volume of memoirs.

Germán Pardo García's *Las voces naturales* confirms the author's place among the major poets of Spanish America. Dario Restrepo Jaramillo's *De la angustia al silencio* is a volume of passionate, febrile lyrics. A promising talent is revealed in Guillermo Payán Archer's *La bahía iluminada*.

Three excellent volumes of short stories were published: Efe Gómez's *Guayabo negro*, Humberto Jaramillo Angel's *Temperatura*, and Antonio Cardona Jaramillo's *Corderilla. Fuera de la ley* is an exciting account of bandit life by the outstanding novelist, J. A. Osorio Lizarazo.

A great loss to Colombian, and American, poetry was the death, in July, 1944, of Guillermo Valencia.

Cuba. Cintio Vitier, in *Extrañeza de estar*, has written a remarkable, somnambulant poetic journey. Regino Pedroso, one of the great Afro-Cuban poets, dedicates his *Bolívar* to Venezuela and to freedom for all peoples. Special mention should be made of the excellent poetry in the quarterly review, *Orígenes*.

Juan J. Ramos y Rubio's *Historia de la literatura cubana* is a somewhat uneven, but exhaustive, reference work. Medardo Vitier's *Del ensayo americano* (Colección Tierra Firme) treats of American essayists and the essay as a literary form. Andrés Iduarte's *Martí, escritor* is a definitive study of Martí's poetry and prose. José Antonio Portuondo's *El contenido social de la literatura cubana* is a searching criticism by a thoughtful and socially-conscious critic. César Rodríguez Expósito's *Hatuéy* is the story of an Indian leader who gave his life trying to free his people from Spanish rule in 1511.

Dominican Republic. In *Matices*, one of the finest Dominican poets, Francisco R. Mejía, has collected the best of his poetry. Manuel del Cabral's *Chinchina busca el tiempo* is a volume of lyrical prose poems. Pedro Henríquez Ureña, whose *Literary Currents in Hispanic America* was mentioned earlier in this article, has made an authoritative study of the characteristic Spanish eleven-syllable line in *El endecasílabo castellano*.

Ecuador. Leopoldo Benítez Argonautas de la selva (Colección Tierra Firme) describes the jungle adventures of Francisco de Orellana, the conqueror of Ecuador. Proof of unusual poetic ability are two volumes by Adalberto Ortiz: *Tierra, son y tambor* and *Camino y puerto de la angustia*. An excellent collection of contemporary verse is Ricardo Ariel's *Antología de la última generación poética ecuatoriana. Lugar de origen* is a new

volume of poems by Jorge Carrera Andrade, one of the greatest contemporary poets. Two outstanding novelists have published works this year: Humberto Salvador, *La novela interrumpida*, and Alfredo Pareja Diez-Canseco, *El muelle*.

Guatemala. José Batres Montúfar, *Poesías*, is a memorial edition of the works of Guatemala's most famous poet, published in commemoration of the centenary of his death. The new quarterly, *Revista de Guatemala*, edited by the poet, Luis Cardoza y Aragón, is of first-rank importance among Latin American literary reviews.

Honduras. *Imaginación de México* is a collection of legends about Mexico, edited by the famous Honduran critic and bibliographer, Rafael Heliodoro Valle.

Mexico. The newly-created Premio Nacional de Ciencias y Artes was awarded to Alfonso Reyes for his *La crítica en la edad ateniense*, the crowning work in the author's series of studies on Greek culture. Reyes is Professor of Greek Culture and Literary Theory in the Universidad Nacional, President of the Colegio de México, one of the most influential cultural forces in America, and one of its most distinguished writers. His *La casa del grillo*, written in 1918 and republished this year, is a series of sketches of family life, described with all the author's wit and charm. The Premio Manuel Avila Camacho was awarded to Enrique González Martínez, Mexico's greatest living poet, the first volume of whose autobiography, *El hombre del buho: Misterio de una vocación*, appeared last year. The Premio Lanz Duret, the most highly prized award in fiction, was won by Jesús Goytortúa Santos for his *Pensativa*, a superbly written romantic novel.

Leopoldo Zea's *Apogeo y decadencia del positivismo en México* is the second volume of an exhaustive study of positivism and its misuse by the *científicos* of Porfirio Díaz. José Vázquez Amaral's *México, datos para su biografía* is a stimulating, though not completely successful, attempt to evaluate the role of Mexico in world history. *Letras mexicanas en el siglo XIX* (Colección Tierra Firme) is a brilliant critique by Julio Jiménez Rueda, one of Mexico's leading literary historians.

In the field of poetry, there is a definitive edition of the *Obras completas* of Manuel José Othón, one of the classic poets of the nineteenth century. Enrique Díez-Canedo's *Epigramas americanos*, published posthumously, contains all the epigrams of the great Spanish critic. Three volumes of new poems are especially noteworthy: Elías Nandino's *Espejo de mi muerte*, a collection of thirty sonnets, José Cardenas Peña's *Llanto subterráneo*, and Jorge González Durán's *Ante el polvo y la muerte*, which won the 1944 Premio Nacional de Literatura. Three literary reviews, *Letras de México*, *Cuadernos Americanos*, and *El Hijo Pródigo*, are publishing much of the best contemporary poetry of Mexico and other countries.

Two published plays won critical applause: Margarita Urueta's *Ave de sacrificio*, an Aztec tragedy of love, and Xavier Villaurrutia's *El yerro cantante*, a tragedy by Mexico's foremost playwright.

José Vasconcelos published *El viento de Bagdad*, a collection of his short stories and essays. *Dios en la tierra* is a volume of short stories by one of the most important young novelists of Mexico, José Revueltas. *Los perros fantasma*s and *Los hermanos Gabriel* are distinguished novels by the well-known essayist, Eduardo Luquín. In *El crímen de tres bandas*, Rafael Solana has again proved himself a master of the fantastic mystery story.

Three illustrious men of letters died in 1945: Joaquín Ramírez Cabañas, teacher and authority on Mexican history, the poet José Juan Tablada, and Rubén M. Campos, critic, poet, and novelist.

Peru. The Premio Nacional de Poesía was awarded to Jorge Eduardo Eielson for his *Antígona*, thirty brooding stanzas of poetic prose upon the tragedy of Antigone. The poems in Magda Portal's *Costa Sur* deal, in strict poetic form, with prison, workers, and *aprimo*.

In *El mundo que agoniza*, César Falcón, companion and follower of the great José Carlos Mariátegui, reflects upon the present agony of the world. Luis Alberto Sánchez, in *Nueva historia de la literatura americana*, has issued a corrected, better organized, and above all, better printed and bound, edition of his standard reference work. A posthumous collection of the works of an outstanding critic and historian is appearing in the *Obras completas* of Carlos Pareja Paz-Soldán. Luis Valcárcel's *La ruta cultural del Perú* (Colección Tierra Firme) is a penetrating analysis of the interplay of cultures throughout Peruvian history. *El tonel de Diógenes* is a posthumous collection of unpublished essays by the great critic and reformer, Manuel González Prada. Héctor Velarde's *Lima en picada* is delightful jesting on the foibles of Lima and the *limeños*.

Venezuela. Several volumes of poetry are noteworthy: Miguel R. Utrera's *Rescoldo*, Fernando Paz Castillo's *Entre sombras y luces*, Felipe Herrera Vial's *Clima de la gaviota y la esperanza*, Matías Carrasco's *Siembra en el viento*, Pablo Rojas Guardia's *Tropico lacerado*, and *Mensaje en siete cantos de la guerra y la paz y desde América*, a long poem by one of Venezuela's major poets, José Ramón Heredia.

De la conquista a la independencia (Colección Tierra Firme) is a survey of four centuries of colonial culture in Spanish America by Mariano Picón-Salas, Venezuela's most widely known critic. Raúl Agudo Freyre's *Andrés Bello, maestro de América* is an excellent study of the educational pioneering of the renowned Venezuelan critic and teacher. *Historia de rapaces* contains five short stories by Julio Rosales, one of the classic *cuentistas* of Venezuela. *Las visiones del camino* are vignettes of Mediterranean travel, written in 1918 by Arturo Usler Pietri, the distinguished author of *Las lanzas coloradas*. *Sobre la misma tierra* is a powerful novel by Rómulo Gallegos, whom many consider the greatest Spanish American novelist.

DONALD D. WALSH

LATTERDAY SAINTS, Church of Jesus Christ of. A religious body, commonly known as the Mormon Church, organized in 1830 at Fayette, N. Y., by Joseph Smith. In 1945 the organization included 154 stakes, 1,169 wards, 123 independent branches, and 38 missions, with a membership of 976,128. Accurate information regarding the missions in Europe and the Pacific has not been available for the past three years. However, at the present time there are 478 missionaries, practically all of whom are laboring in the United States. The administrative affairs of the church and the performance of all church ordinances are attended to by the priesthood consisting of the Melchizedek Priesthood, a senior order with 122,547 male members, and the Aaronic Priesthood, a junior order with 104,987 male members.

The church maintains eight temples which are devoted to sacred ordinances for the living and the dead, such as baptisms, endowments, and marriages. It also maintains the Brigham Young Uni-

versity, Ricks Junior College, Latter-day Saints Business College, Juarez Academy in Mexico, and 12 collegiate institutes. The auxiliary bodies include the Women's Relief Society numbering, in 1945, 102,610 members who care for the sick and the needy. The Sunday Schools, in 1945, had an enrollment of 342,954. The two Mutual Improvement Associations, composed of young people, had an enrollment of 117,805. The Primary Association for those under 12 had 127,960.

The Church holds in Salt Lake City, Utah, two general conferences each year, one during the first week in April, and the other the first week in October, at which the work of the general authorities is reviewed. The general authorities, as sustained at the 1945 October general conference were: First Presidency: George Albert Smith, President; J. Reuben Clark, Jr., First Counselor, David O. McKay, Second Counselor. Quorum of the Twelve Apostles: George F. Richards, President.

LAW. This review is limited to important developments during the past year in judicial decisions, legal procedure, and jurisprudence. For discussion of legislation and similar topics, the special title involved should be consulted.

War and International Law Decisions. For the first time in more than the century and a half of our national existence the Supreme Court had occasion to review a conviction for treason. Article III, Section 3 of the Constitution states that "Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court." Prosecution of the accused, Cramer, resulted from his association with two of the German saboteurs who in June 1942 landed in Florida from German submarines for the purpose of disrupting industry in this country and whose cases were considered in *Ex parte Quirin*, 317 U.S. 1. The overt acts were that Cramer talked and drank with the two saboteurs on June 23, 1942, shortly before their apprehension, at a tavern and at a cafeteria in New York City. There was no two-witness proof of what was said; nor any showing that Cramer gave them any information, shelter, or sustenance. "It is outside the commonplace overt acts as proved," said Mr. Justice Jackson for the majority in reversing, "that we must find all that convicts or convinces either that Cramer gave aid and comfort or that he had a traitorous intention." The dissent thought that Cramer's admissions, made when he took the witness stand in his own behalf, established that the overt acts were not accidental or casual conferences, but that these meetings were part and parcel of the treasonable project. Since levying war against the United States was not involved, the two elements of treason as applied to the case were: adherence to the enemy; and rendering him aid and comfort. In explaining these elements Mr. Justice Jackson stated: "A citizen intellectually or emotionally may favor the enemy and harbor sympathies or convictions disloyal to this country's policy or interest, but so long as he commits no act of aid and comfort to the enemy, there is no treason. On the other hand, a citizen may take actions which do aid and comfort the enemy—making a speech critical of the government or opposing its measures, profiteering, striking in defense plants or essential work, and the hundred other things which impair our cohesion and diminish our strength—but if there is no adherence to

the enemy in this, if there is no intent to betray, there is no treason." Adherence to the enemy, in the sense of a disloyal state of mind or treasonable intent, need not be proved by two witnesses, but the framers of the Constitution safeguarded the concept that thoughts and attitudes could not make a treason with the procedural two-witness rule to an overt act. In this and in other respects the framers departed from, and restricted, the crime of treason as established in England in 1351, 25 Edw. III, which after 600 years is still the living law of treason in that country. They had had too much experience with the sweeping English law and they "adopted every limitation that the practice of governments had evolved or that politico-legal philosophy to that time had advanced." And during our entire national existence not one execution on a federal treason conviction has taken place. *Cramer v. United States*, 325 U.S. 1. In addition to the extensive discussion of the law of treason contained in the opinions, see Hurst, *Treason in the United States*, 58 Harv. L. Rev. 226, 806.

Conviction of certain national and local leaders of the German-American Bund on a charge of conspiring to counsel evasion of the Selective Training and Service Act was reversed in *Keegan v. United States*, 325 U.S. 478, because of insufficient evidence. The Government's case was botched on Bund Command 37 which, while unequivocally directing registration under the Act, denounced § 8(1) of the Act expressing the congressional policy that any vacancy caused by induction of an employee should not be filled by a member of the Bund, and asserted further that "Every man, if he can, will refuse to do military duty until this law and all other laws . . . which confine the citizenship rights of Bund members are revoked." Concurring, Mr. Justice Black aptly states: "When we view the conduct of these defendants in all of this setting, their vigorous language appears to have been little, if any, more condemnatory of the discriminatory section of the Selective Service Act than language previously used by this Court with reference to legislation of a similar pattern." In *Markham v. Cabell*, 14 L.W. 4037, the Court in construing the Trading with the Enemy Act, passed Oct. 6, 1917, and subsequently amended several times, was required to determine what provisions were of permanent character, and hence became effective on the advent of World War II, and what provisions were temporary in character and applied only to World War I. It ruled that § 9(a) permitted an American citizen to sue the Alien Property Custodian on a claim originating in 1935 against an Italian corporation whose assets vested in the Custodian in 1942; that § 9(e), which barred claims that were not owing prior to Oct. 6, 1917, was a temporary provision pertaining to World War I claims and inapplicable; and that the supposed inequities of allowing suit on claims against enemy aliens while there was no provision for suits on claims against friendly foreign nationals, such as Denmark, Norway, Holland, and others, whose assets in this country were "frozen" and subsequently vested in the Custodian, would not defeat the right of suit clearly given against enemy aliens.

In the field of economic controls the Court sustained the Price Administrator's construction of his General Maximum Price Regulation that the highest price charged for delivery of an article or material during March, 1942, established the maximum price for subsequent sales, although the delivery was made pursuant to a contract entered into in October, 1941. *Bowles v. Seminole Rock &*

Sand Co., 325 U.S. 410. And ruled in *Mine Safety Appliances Co. v. Forrestal*, 14 L.W. 4048, that a suit to enjoin the Under Secretary of the Navy from directing government disbursing officers, pursuant to the Renegotiation Act, to withhold payments due plaintiff on other contracts, sufficient in amount to offset the government's loss due to the excessive profits, was basically a suit against the United States since it was essentially designed to reach money which the government owns and the suit could not be maintained without its consent. This ruling apparently forces all aggrieved contractors to seek redress before the Tax Court.

Turning to the international law and related fields, we find that in the consummation and subsequent interpretation of treaties with the Indians we have often disregarded principles of elemental justice. *Northwestern Bands of Shoshone Indians v. United States*, 324 U.S. 335, illustrates. The issue was whether the aboriginal or Indian title of the Northwestern Bands of Shoshones to extensive lands in the northwest was recognized by the United States in the Box Elder Treaty made in Utah Territory on July 30, 1863. After the discovery of gold in California, white travelers and settlers began to traverse and people the Shoshone domain with the result that the Indian's game disappeared. Indian depredations interfered with travel and settlement, the overland mails, and the new telegraph lines. By the time of the outbreak of the Civil War the Commissioner of Indian Affairs was aware of the Shoshone's misery, and the dangers to the emigrant trains and need for peace to enable travel and settlement in the area. The treaty, which skilled and educated commissioners sent from Washington effected with nomadic tribes of Indians (who could neither read nor write and were, of course, wholly ignorant of American property law and legal terms of art going back to the times of Lord Coke) is now interpreted by the Court, in a 5-4 decision, as buying peace from the Indians but without any recognition of their claim to the lands which they occupied. Justices Jackson and Black, concurring, recognized the moral rights of the Indians, but that "The white was a better killer"; appreciated that the conflicts between the Shoshones and the whites "sometimes leave one in doubt which side could make the better claim to be civilized"; and concluded that the Indian problem is essentially a sociological problem for Congress. The case for the Indians is ably stated in the dissent of Mr. Justice Douglas. "He who comes to my abode and bargains for free transit or a right of way across the land on which I live and which I proclaim to be my own certainly recognizes that I have a claim to it. That and more was done here. Routes of travel through this Shoshone country, the establishment of military agricultural settlements and military posts, and maintenance of ferries over the rivers, the erection of houses and settlements, the location, construction, and operation of a railroad, the maintenance of telegraph and overland stage lines were all negotiated. These provisions alone constitute plain recognition by the United States that it was dealing with people who had the power to grant these rights of travel and settlement. The United States, of course, did not need to follow that course. It could have invaded this Indian country and extinguished the Indian title by sword or by appropriation. . . . But it did not choose that course. It chose to negotiate a treaty." And concludes from the majority's interpretation of the treaty that "what these Indians did not lose to the railroads and to land companies they lost in the fine web of legal niceties."

Republic of Mexico v. Hoffman, 324 U.S. 30, denied Mexico's claim that a ship owned by it, but leased to and operated by a private Mexican corporation, was immune from arrest. The State Department had also refrained from recognizing the immunity. Extensive, and in part rather polemic, discussion of, and support for, the President's power to control foreign relations through executive agreements is found in McDougal and Lans, *Treaties and Congressional-Executive or Presidential Agreements: Interchangeable Instruments of National Policy*, 54 Yale L.J. 181-351, 354-615. An opposite point of view is set forth in Borchard, *Treaties and Executive Agreements—A Reply*, 54 Yale L.J. 616-664; see also Borchard, *Shall the Executive Agreement Replace the Treaty?*, 53 Yale L.J. 664.

Civil Liberties. Four cases of more than routine importance involved: the deportation order of Harry Bridges; the Texas statute requiring labor organizers to register; the subjection of state peace officers to federal prosecution for murder by them of a person in their custody; and the right of Illinois to deny admission of a conscientious objector to the bar. Congress in 1940 provided for the deportation of any alien who was "at the time of entering the United States, or has been at any time thereafter" affiliated with or a member of the Communist Party. After extensive hearings, the immigration inspector, Judge Sears, formerly of the New York Court of Appeals, found that Bridges, an alien and militant west coast labor leader, had both been affiliated with and a member of the Communist Party; the Board of Immigration Appeals found otherwise, the Attorney General then affirmed Judge Sears' findings and ordered Bridges' deportation; a federal district court denied Bridges' collateral attack made upon the order by habeas corpus proceedings and was affirmed by the Ninth Circuit. The Supreme Court, three justices dissenting, reversed on the grounds that the deportation order rested on a misconstruction of the statutory term "affiliation," and that Bridges had had an unfair hearing on the question of his membership in the Communist Party. This latter ground is taken in cavalier disregard of the Court's orthodox treatment of administrative hearings and findings, as the dissent points out. Mr. Justice Murphy, concurring with the majority, adopts the thesis that the statute violates the Bill of Rights and is unconstitutional. *Bridges v. Wixon*, 65 S. Ct. 1443. A Texas statute provided that a paid labor organizer should not solicit membership in a union until he filed a registration with the Secretary of State giving certain identifying information and statement of union affiliation; no fee was to be charged for registering; and upon the statutory information being furnished the Secretary was required to furnish the applicant an organizer's card. One Thomas, President of the International Union U.A.W., vice-president of C.I.O., and a labor organizer within the meaning of the Texas statute, was adjudged in contempt by a Texas state court for violating its order restraining him from soliciting membership in a union until he had complied with the statute. Reversing the Texas Supreme Court, which had denied his petition for habeas corpus, the United States Supreme Court, overriding the presumption in favor of constitutionality and the findings of the state Supreme Court that conditions exist in Texas which justify and require the statutory identification of paid organizers, holds the statute violative of the constitutional guarantee of free speech. Mr. Justice Jackson, concurring, makes this pertinent comment: "I must admit that

in overriding the findings of the Texas court we are applying to Thomas a rule the benefit of which in all its breadth and vigor this Court denies to employers in National Labor Relations Board cases. . . . However, the remedy is not to allow Texas improperly to deny the right of free speech but to apply the same rule and spirit to free speech cases whoever the speaker." *Thomas v. Collins*, 323 U.S. 516, noted in 33 Geo. L. Rev. 227, 31 Va. L. Rev. 691, 33 Calif. L. Rev. 317. State peace officers who, after arresting a Negro, wilfully beat him to death are subject to federal prosecution and conviction under 18 U.S.C. § 52 for depriving him under color of law of "rights, privileges, or immunities secured or protected by the Constitution," namely, the right guaranteed by the Fourteenth Amendment not to be deprived of life without due process of law. *Screws v. United States*, 325 U.S. 91 (conviction reversed for error in the charge which, under the circumstances, could hardly be said to be harmful). The Illinois Supreme Court's refusal to admit Summers to the practice of law on the ground that because of his convictions against violence he could not honestly take the required oath to support the Constitution of Illinois, which requires a willingness to perform military service, was affirmed. *In re Summers*, 65 S. Ct. 1307.

Other cases are important, not because virginal land is plowed, but because inroads upon well tilled areas are carefully prevented. Thus we find a unanimous affirmance of the New York Court of Appeals' ruling that the Railway Mail Association was a labor organization within the meaning of the New York Civil Rights Law, and that this law could constitutionally forbid such a labor organization from denying a person membership or equal treatment by reason of race, color, or creed. *Railway Mail Ass'n v. Corsi*, 65 S. Ct. 1483. The principle, noted in last year's review, that the right of an accused to a fair trial in State courts is guaranteed by the Fourteenth Amendment, is enforced. Counsel must be assigned to accused if he is unable to employ one, is incapable adequately of making his defense, and does not intelligently and understandingly waive counsel. *Williams v. Kaiser*, 323 U.S. 471. And this right of counsel is the right to effective counsel, coupled with adequate opportunity to prepare for trial. *Hawk v. Olson*, 66 S. Ct. 116. A state conviction which is the fruit of a forced confession, *Malinski v. New York*, 324 U.S. 401, or perjured testimony, known to be such by the prosecuting attorney, *White v. Ragen*, 324 U.S. 760, may not stand. And while the Fourteenth Amendment forbids any discrimination against a race in selecting a grand jury, a defendant has the burden of establishing such discrimination before his conviction will be reversed. *Akins v. Texas*, 325 U.S. 398.

Labor and Business. In addition to the *Bridges* and *Thomas* cases, *supra*, the decisional entries of the Court relative to labor are decidedly on the credit side of the ledger. This implies no criticism of the Court since in the main it is construing statutes clearly designed for the benefit of labor and properly must interpret them to achieve their objectives. The validity of Alabama's comprehensive statute regulating labor unions remains to be determined. This statute, recently enacted, establishes a Department of Labor, sets up mediation machinery, requires a labor organization functioning in the state to file various reports, financial statements, and a copy of its constitution and by-laws and a copy of similar documents of the national or international union, if any, to which it

belongs, and regulates some phases of the internal affairs and activities of labor organizations, and various aspects of picketing, boycotting, and striking. A labor union sought a declaratory judgment that this statute was unconstitutional; validity was upheld by the Alabama Supreme Court. The Federal Supreme Court granted, then dismissed the writ of certiorari because the record afforded inadequate factual basis for determining the grave statutory and constitutional questions raised. *Alabama State Federation of Labor v. McAdory*, 65 S. Ct. 1384; *Congress of Industrial Organizations v. McAdory*, 65 S. Ct. 1395.

The Court has safeguarded the substantial right to jury trial in actions brought by employees under the Federal Employer's Liability Act, whether in state, *Blair v. Baltimore & O. R. Co.*, 323 U.S. 600, or federal court, *Tiller v. Atlantic Coast Line R. Co.*, 323 U.S. 574. And has given a realistic interpretation to Federal Rule 15(c) so that amendments to complaints, which involve the same general conduct, transaction, or occurrence originally pleaded, may not be barred by the statute of limitations. *Tiller v. Atlantic Coast Line R. Co.*, *supra*. And while the Court adheres to the principle that it will not review judgments of state courts that rest on adequate and independent state grounds since its only power over state judgments is to correct them to the extent that they incorrectly adjudicate federal rights, it will hold decision of a Federal Employer's Liability Act case in abeyance until it is made to appear whether the state supreme court's dismissal of the action is based on a state, rather than a federal ground. *Herb v. Pitcairn*, 324 U.S. 117 (Suit under the federal act was begun in an Illinois city court; after the state supreme court had held in another case that a city court did not have jurisdiction over actions arising outside the city limits, the employee's suit was transferred to another Illinois state court having jurisdiction. The non-federal ground was whether the case could be transferred, assuming that it could be, the federal ground was whether the action was commenced for purposes of the statute of limitations, when suit was instituted in city court or when it was transferred to the state court having jurisdiction).

The Railway Labor Act marks out distinct routes for settlement of two classes of dispute: the first, or "major disputes," relate to the formation of collective agreements or efforts to secure them; the second, or "minor disputes," are those which inevitably appear in the carrying out of major agreements and policies or arise incidentally in the course of employment. "Major disputes" go first to mediation under the auspices of the National Mediation Board; if that fails, then to acceptance or rejection of arbitration, and finally to possible presidential intervention to secure adjustment. For their settlement the statutory scheme retains throughout the traditional voluntary processes of negotiation, mediation, voluntary arbitration, and conciliation. Compulsions go only to insure that those procedures are exhausted before resort can be had to self-help. In the settlement of "minor disputes" the Adjustment Board was created with jurisdiction to determine grievances and make awards concerning them, with judicial review and enforcements of awards expressly or impliedly provided in certain instances, the Board's decisions in other cases to be "final and binding." Monetary claims of employees for back pay alleged to be due them by their employer-railroad, under the terms of the contract governing hours of work and rates of pay, fall into the classification of "minor disputes," and the bargaining representa-

tive of the union does not have authority by virtue of the Act either to compromise and settle such claims or to submit them for determination by the Adjustment Board. Hence the Board's award against the claimants is not binding upon them, where they had no notice of and did not participate in the hearing preceding the award, absent a showing that the union representative who did appear had their authority to act for them. *Elgin, J. & E. Ry. Co. v. Burley*, 65 S. Ct. 1292.

Orders of the National Labor Relations Board have been consistently sustained: its cease and desist order may include within its terms the "successors and assigns" of the respondent employer, *Regal Knitwear Co. v. N.L.R.B.*, 324 U.S. 9; that the practice of an employer in precluding employees from wearing union steward buttons, and in enforcing a general plant rule against solicitation or the distribution of circulars so as to prevent employees, on their own time, from soliciting union membership or distributing union literature constituted unfair labor practices, *Republic Aviation Corp. v. N.L.R.B.*, 324 U.S. 793, noted in 13 Geo. Wash. L. Rev. 494 (the employer had forbidden the wearing of the union steward buttons so as to maintain a strict neutrality in union matters; the soliciting and distribution rules were general in character and not aimed directly at labor); that non-supervisory employees of two clothing alteration departments of a large department store constitute an appropriate unit for collective bargaining, and hence the employer's failure to bargain with the union which had been certified to it as the representative of the non-supervisory employees, and the employer's application to the National War Labor Board for a general wage increase applicable to all its employees and thus going over the head of the union representing the non-supervisory employees constituted unfair labor practices, *May Department Store Co. v. N.L.R.B.*, 14 L.W. 4042 (the non-supervisory employees, which were held to be an appropriate unit, were 28 in number and constituted the employees in 2 departments of the store; the store had approximately 5,000 employees and 350 departments). And the Court in *Inland Empire District Council, etc. v. Millis*, 65 S. Ct. 1316, refused, at the suit of an A.F.L. union, to set aside the Board's certification of a C.I.O. union as the bargaining representative. But where the Board secured a court decree directing enforcement of its order providing among other things, that employees be reinstated and given back pay according to the formula prescribed by the Board, and nearly two years later the Board sought partial vacation of such order and remand of the cause to it for trial of how compensation should be calculated on ground that certain facts produced by employers had created in the Board's mind an erroneous impression which a fuller disclosure would have removed, the Board's petition was properly denied. Public interest in the finality of court judgments so demands. *International Union of Mine, Mill & Smelter Workers, etc. v. Eagle-Picher Mining & Smelting Co.*, 325 U.S. 335, noted 45 Col. L. Rev. 779. Because the National Labor Relations Act protects the freedom to select bargaining representatives, the Court invalidated a Florida statute requiring any business agent of a labor union to pay \$1 for an annual license, to be withheld from one who has not been a citizen for ten years or has been convicted of felony or is not of good moral character, and requiring a union to pay \$1 and file an annual report of its name, officers, and location of offices, as applied to a business agent and the union of employees of a ship-

building company engaged in interstate commerce, where union and agent were enjoined from functioning until they had complied with the statute. *Hill v. Florida*, 65 S. Ct. 1373. Cf. *Thomas v. Collins*, 323 U.S. 516 (see *Civil Liberties*, p. 324).

Cases involving the Fair Labor Standards Act have very generally been in favor of its coverage and those who would enforce its provisions. The *Western Union* case is but an exception which proves the principle. Since the telegraph company was not forbidden by the Act from employing child labor as messengers, the courts may not enjoin it from transmitting messages while it continues such employment. *Western Union Telegraph Co. v. Lenroot*, 323 U.S. 490. See Radin, *A Case Study in Statutory Interpretation: Western Union Co. vs. Lenroot*, 33 Calif. L. Rev. 219; 8 U. Detroit L.J. 125. The Wage and Hour Administrator could, on the other hand, prohibit industrial homework as a necessary means of making effective a minimum wage order for the embroideries industry. *Gemsco, Inc. v. Walling*, 324 U.S. 244. The regular rate of pay may not be fixed by an employment contract at a point completely unrelated to the payments actually and normally received each week by the employees, for the purpose of avoiding the overtime pay provisions of the Act. *Walling v. Youngerman-Reynolds Hardwood Co., Inc.*, 325 U.S. 419 (applying the principle of *Walling v. Helmerich & Payne*, discussed in last year's review); *Walling v. Harnischfeger Corporation*, 325 U.S. 427. Neither the right to the basic statutory minimum wage, nor liquidated damages (an amount equal to the unpaid minimum wages and unpaid overtime compensation) may be waived by an employee subject to the Act, and in the absence of a bona fide dispute between the employer and the employee as to liability, an acceptance by the employee of a part of the amount due him coupled with a release by him does not absolve the employer from his statutory liability. *Brooklyn Sav. Bank v. O'Neil*, 324 U.S. 697, noted in 45 Col. L. 798. But an employee recovering minimum wages and liquidated damages is not also entitled to interest on the sums so recovered, since liquidated damages compensate him for the delay in payment of the minimum wages. *Ibid.*; *J. F. Fitzgerald Const. Co. v. Pedersen*, 324 U.S. 720 (holding also that construction company employees who repaired abutments or substructures of bridges on which were laid railroad tracks used in interstate transportation were "engaged in commerce" within the meaning of the Act). Employees working in the warehouse and central office of an interstate grocery chain store system are not "engaged in any retail establishment" and hence are within the coverage of the wage and hour provisions. *A. H. Phillips, Inc. v. Walling*, 324 U.S. 490. Since executive officers and administrative employees working in the central office building of the employer, a corporation engaged in the interstate distribution of milk and related products, were engaged in "production of goods for commerce," within the meaning of the Act, it was held that elevator men and other maintenance employees in such building were engaged in occupations "necessary to production of goods for commerce," and within the Act's coverage. *Borden Co. v. Borella*, 65 S. Ct. 1223. (The Chief Justice dissented: Congress did not "by a 'house-that-Jack-built' chain of causation bring within the sweep of the statute the ultimate causa causarum which result in the production of goods for commerce."). But maintenance employees of the owner of a 48-story New York office building, whose offices are leased to more than a

hundred tenants pursuing a great variety of enterprises, some local, some interstate, are not within the coverage of the Act. *10 East 40th Street Bldg. v. Callus*, 325 U.S. 578. In the portal to portal pay case, *Tennessee Coal, Iron & R. Co. v. Muscoda Local No. 123*, 321 U.S. 590, noted in last year's review, the Court held that underground travel in iron ore mines constituted work and hence was included in the compensable workweek within the meaning of the Act. *Jewell Ridge Coal Corp. v. Local No. 6167*, 65 S. Ct. 1063, 1550, decided that this same result must be reached as regards underground travel in bituminous coal mines. And the same liberal interpretation of the Independent Offices Appropriation Act in favor of the employee and against, this time, the Government as employer resulted in holding that a Panama Canal dredge operator was within the Act's coverage and entitled to time and one-half pay for hours exceeding 40 per week. *United States v. Townsley*, 323 U.S. 557.

Application of the anti-trust acts to labor has resulted in a chapter of troubled judicial decisions. The issue has been recently posed in this form: "Do labor unions violate the Sherman Act when, in order to further their own interests as wage earners, they aid and abet business men to do the precise things which that Act prohibits?" The question arose out of these circumstances. The members of an electrical union in New York City worked for local electrical manufacturers, and contractors who installed electrical equipment. To expand its membership, obtain shorter hours, increased wages, and enlarged employment opportunities for its members the union realized that local manufacturers must have the widest possible outlets for their product. Using conventional labor methods, such as strikes and boycotts, the union gradually obtained more and more closed shop agreements with both manufacturers and contractors in the New York City area. Agencies were set up composed of representatives of the union, manufacturers, and contractors to boycott recalcitrant local contractors and manufacturers and to bar from the area equipment manufactured outside its boundaries. The combination was highly successful. Manufacturers of electrical equipment, located outside of New York City but desiring to sell their products within that area, brought an action against the union to have its activities declared illegal and enjoined. The Court in sustaining the action reviews the legislation and judicial history. After the passage of the Sherman Act in 1890 sharp controversy arose as to whether this statute against monopolies applied to labor union activities. The federal courts adopted the view that it did and utilized the injunction to enforce it. Labor protested vigorously and many proposed measures were introduced in Congress. In 1914 Congress enacted the Clayton Act, which attempted to eliminate certain "trade practices" that injuriously affected interstate commerce; declared in the famous § 6 that "the labor of a human being is not a commodity or article of commerce" and that nothing contained in the anti-trust laws should forbid the existence and operation of labor unions; and limited the use of the federal injunction. Labor proclaimed this Act as its "Magna Carta." But the Court in the *Duplex*, 254 U.S. 443, and *Bedford*, 274 U.S. 37, cases, where the union had engaged in a secondary boycott, held that the Clayton Act exempted labor union activities only insofar as these activities were directed against the employees' immediate employers and that controversies over the sale of goods by other dealers did not constitute "labor disputes" within the meaning of the Clayton Act. In 1932 Congress passed the

Norris-LaGuardia Act, which greatly broadened the meaning of "labor dispute" as applied to the curtailment of the federal courts' jurisdiction to issue injunctions in such cases. Subsequently the Court held in *United States v. Hutcheson*, 312 U.S. 219, that the Sherman, Clayton, and Norris-LaGuardia Acts must be jointly considered and that the *Duplex* and *Bedford* cases were inconsistent with the policy set out in the three "interlacing statutes." The Court, nevertheless, now concludes that "Congress never intended that unions could, consistently with the Sherman Act, aid non-labor groups to create business monopolies and to control the marketing of goods and services." *Allen Bradley Co. v. Local Union No. 3*, 65 S. Ct. 1533. The doctrine of this case does not, however, subject a union to the Sherman Act for its refusal to admit to membership an employer's workers, although this makes it impossible for the employer profitably to continue in business. *Hunt v. Crumboch*, 65 S. Ct. 1545.

In the non-labor field, application of the anti-trust acts is also often complicated by the necessity to harmonize competing and overlapping policies. This is well illustrated by Georgia's suit to enforce the anti-trust acts against some twenty interstate railroad companies. Pursuant to the Supreme Court's procedure the matter arose on motion by Georgia for leave to file its complaint, charging that in violation of the anti-trust acts the defendants conspired to fix arbitrary and non-competitive rates and charges for transportation of freight by railroad to and from Georgia. Georgia alleged that its proprietary interests as owner of a railroad and various public institutions and the public interest in non-discriminatory freight rates, which it was entitled to protect as *parens patriae*, were injured. The Supreme Court sustained the State's motion. The following matters were resolved. Georgia has standing to sue to protect both its proprietary and the public interests; and is a "person" entitled to enforce the civil sanctions of the anti-trust laws. It may not, however, recover damages in this suit, since the legal rights of a shipper against a carrier in respect to a rate are to be measured by the published tariff until suspended or set aside, normally by the Interstate Commerce Commission, less frequently by the United States in a civil injunctive suit against the carriers, brought pursuant to the Clayton Act, for violation of the anti-trust laws. But the injunctive relief against the railroads conspiring to fix rates, which Georgia also sought, is not a matter subject to the jurisdiction of the I.C.C. While it is true that Georgia may not enjoin any established rate, it is nevertheless, entitled to remove from the field of rate-making the illegal influence of the carriers' combination, and this does not undercut or impair the Commission's primary jurisdiction over rates. The Supreme Court has original jurisdiction under Article III since this was a civil action, to which Georgia was a party plaintiff, and corporations, citizens of other states, were defendants. If two of the defendant corporations were citizens of Georgia they could be dropped from the suit. And the forum, the Supreme Court, is proper and convenient. *State of Georgia v. Pennsylvania R. Co.*, 324 U.S. 439. See 98 U. Pa. L. Rev. 442. Conflicting policies in the patent field have been resolved by holding that rights conferred by patent do not give a universal license against positive prohibitions, and are subject to the limitations of the anti-trust laws. *Hartford-Empire Co. v. United States*, 323 U.S. 386, 324 U.S. 570, noted in 45 Col. L. Rev. 601, 14 Fordham L. Rev. 91, 27 J. Patent Office Soc. 361.

The Government's suit against the Associated Press is another landmark case in this field. The by-laws of the AP forbade members to furnish news to non-members and required a member's competitor seeking membership to pay 10% of the total amount of the regular assessments received by AP from old members in the same competitive field since Oct. 1, 1900, and obtain a majority vote of members. A specially constituted district court, composed of three judges, sustained the Government's motion for summary judgment. It held that these by-laws violated the Sherman Act and enjoined their continued observance; and further held that a contract between AP and Canadian Press (a Canadian news agency similar to AP), under which the Canadian agency and AP obligated themselves to furnish news exclusively to each other, was an integral part of the restrictive membership conditions and its observance should be enjoined pending abandonment of the membership restrictions. The Supreme Court affirmed. Although the majority opinion is not pitched upon a public utility theory, in view of the fact that AP does not monopolize the field of news distribution as against UP and INS (comparable to AP "in size, scope of coverage, and efficiency"), and the implication of the decree that AP may not discriminate among applicants for membership, the inevitable result must be to force upon AP, UP, INS, and other such agencies, the duty to furnish news to all papers and thus subject them to the duties of a public utility. *Associated Press v. United States*, 65 S. Ct. 1416.

The effect of the Miller-Tydings amendment to the Sherman Act was considered in *United States v. Frankfort Distilleries, Inc.*, 324 U.S. 293. The Court held that while this amendment permits the seller of an article, which bears his trade-mark, brand, or name, to prescribe a minimum resale price by contract, if such contracts are lawful in the states where resale is made (as they were in Colorado, the state in question) and if the trade-marked article is in free and open competition with other articles of the same commodity, it does not permit combinations of business men to coerce others into making such contracts. In cases involving the Federal Trade Commission and its relation to the anti-trust acts the Court sustained the Commission's finding that a candy manufacturer's basic point price system resulted in discriminations in price between different purchasers of glucose so as to run afoul of the Clayton Act as amended by the Robinson-Patman Price Discrimination Act. *Corn Products Refining Co. v. F.T.C.*, 324 U.S. 726. And reached a similar result in *F.T.C. v. A. E. Staley Mfg. Co.*, 324 U.S. 746 (a Decatur, Ill. glucose manufacturer's delivered prices which included freight from Chicago, and practice of granting favored customers additional time to take deliveries, or lower prices constituted "price discrimination"). But while the Commission has authority to investigate, recommend, and report upon alleged violations of the Sherman Act by export associations, it does not have primary jurisdiction, and the Government can proceed independently and in the usual ways against such export associations for Sherman Act violations. *United States Alkali Export Ass'n v. United States*, 325 U.S. 196.

Decisions Concerning the Federal System. Distribution of power between the states and the federal government and between the states themselves is a continuing process of adjustment, a necessary incident of our federal system, and a matter to be delicately handled and intelligently resolved. Challenges to the power of the state to tax or the

method employed are quite consistently unsuccessful. Thus a foreign corporation which maintains resident salesmen in the State of Washington, who continuously and systematically solicit orders and sometimes use display rooms, is subject to Washington's unemployment tax based on the salaries paid such salesmen; and it is subject to suit by the State in its courts for the collection of the tax where process is served on one of its resident salesmen and a copy of the process is sent by registered mail to the corporation at its principal place of business. Both the tax and the procedure employed to reduce it to judgment were sustained against the claim that the taxpayer was denied the due process of law guaranteed by the Fourteenth Amendment. *International Shoe Co. v. Washington*, 14 L.W. 4032. In answering a challenge to the method of state tax assessments as discriminatory the Court stated that the Fourteenth Amendment's prohibition against the denial of equal protection of the law applies only to taxation which in fact bears unequally on persons or property of the same class and that mere differences in modes of assessment do not contravene the Constitution unless they are shown to produce such inequality. Nor does the equal protection clause prohibit inequality in taxation which results from mere mistake or error in judgment of tax officials; or which is not shown to be the result of intentional or systematic undervaluation of some but not all of the taxed property in a single class. *Charleston Federal Savings & Loan Ass'n v. Alderson*, 324 U.S. 182. Nor does the equal protection clause require the tax or rate of tax exacted from a foreign corporation as a condition of entry into the state to be the same as that imposed on domestic corporations. *Lincoln Nat. Life Ins. Co. v. Reed*, 325 U.S. 673 (Indiana corporation's business in Oklahoma held subject to that state's 4% gross premium tax, although domestic insurance companies were not so taxed). Where a state provided that a taxpayer could sue its department of treasury to recover taxes paid under protest, the waiver was held to apply only to suits in the state court, and hence the taxpayer could not maintain a suit in the federal court since such action was essentially against the State. *Ford Motor Co. v. Department of Treasury of Indiana*, 323 U.S. 459 (although objection that the State was being sued in violation of the Eleventh Amendment was first made in the Supreme Court).

State regulatory statutes have in the main received generous support. The due process clause does not assure protection against injuries remote, contingent, and speculative. Hence Washington's statute extending the time for the beneficiary of an award under the Industrial Insurance Act to apply for additional compensation on account of aggravation of his injury is valid, despite the possibility that in the future the employer might have to pay a larger premium into the industrial fund because of this. *Gange Lumber Co. v. Rowley*, 66 S. Ct. 125. The North Dakota Statute requiring corporations, within ten years, to dispose of farm land not necessary to the conduct of their business was upheld against attack under both the due process and equal protection clauses. *Asbury Hospital v. Cass County*, 66 S. Ct. 61 (on failure to comply with the statute the land is escheated to the county, sold by it, and proceeds paid to corporate owner). Extension in 1943 for another year of New York's mortgage foreclosure moratorium is not repugnant to the contract clause of the constitution. *East New York Sav. Bank v. Hahn*, 66 S. Ct. 69 (the original legislation, first enacted in 1933, suspended the right to foreclose for default in the payment of

principal for a year as to real estate mortgages executed prior to July 1, 1932; year by year (except in 1941 when a two-year extension was made the 1933 statute has been renewed for another year). Where, however, the federal interest, constitutional or statutory, is believed by the Court to be unnecessarily interfered with, state statutes have been invalidated. The Arizona Train Limit statute is an example. This law, adopted by the state as a safety measure, limited passenger trains to 14 cars and freight trains to 70 cars. It was held unconstitutional as an undue burden on interstate commerce in view of the showing that the state interest is outweighed by the interest of the nation in an adequate, economical, and efficient railway transportation system. *Southern Pac. Co. v. State of Arizona*, 65 S. Ct. 1515 (this conclusion receives support in the fact that after the institution of the suit and during the war the I.C.C., as of Sept. 15, 1942, felt it necessary to promulgate an order suspending the operation of state train limit laws for the war's duration). And it will be recalled that the labor registration statutes of Texas and Florida were invalidated: the former as infringing the constitutional guarantee of free speech, and the latter as repugnant to the National Labor Relations Act. (See *Thomas v. Collins* and *Hill v. Florida* noted, respectively, under Civil Liberties, and Labor and Business, *supra*). Furthermore the limitation upon state judicial power was pointed out in discussing civil liberties: state judgments of conviction may not stand where the elemental principles of fair play guaranteed by the due process clause of the Fourteenth Amendment have been violated. An additional limitation upon state judicial power is the full faith and credit clause. *Williams v. North Carolina*, 325 U.S. 226. This case holds that North Carolina in a bigamy prosecution is not required to recognize default divorce decrees which the defendants obtained in Nevada, where the now-defendants (plaintiffs in the Nevada divorce actions) were mere transients, not domiciled nor bona-fide residing in Nevada. For discussion, see Loreuzen, *Extraterritorial Divorce—Williams v. North Carolina II*, 54 Yale L.J. 799; also his article discussing the first *Williams* case entitled *Haddock v. Haddock Overruled*, 52 Yale L.J. 341, and 1 Moore's *Federal Practice Supplement* (1942) 196-202.

An accommodation of the federal judicial power to state substantive law is required, where the case is in the federal court because of the citizenship of the parties; and a state statute of limitations is a rule of substantive law and must be applied by the federal courts. *Guaranty Trust Co. v. York*, 65 S. Ct. 1464 (dictum in the case is subject, however, to criticism for perpetuating the equitable remedial rights doctrine under which the federal courts need not apply state law). Application of state law is ably discussed by Judge Clark in his Benjamin N. Cardozo Lecture entitled "State Law in the Federal Courts: The Brooding Omnipresence of *Erie R. Co. v. Tompkins*." See 114 N.Y.L.J. p. 1557.

The long arm of the federal government under the interstate commerce clause is well illustrated by the decisions discussed under Labor and Business, *supra*, dealing with the anti-trust acts, the National Labor Relations Act, and the Fair Labor Standards Act. Limitations upon this power applied to the regulation of local utilities are set forth in *Connecticut Light & Power Co. v. F.P.C.*, 324 U.S. 515, noted in 58 Harv. L. Rev. 1072.

Federal Administrative Law. Continuing the trend noted in last year's review, the Court has generally sustained federal administrative action. *Colorado Interstate Gas Co. v. F.P.C.*, 324 U.S. 581 (rate

order); *Panhandle Eastern Pipe Line Co. v. F.P.C.*, 324 U.S. 635 (similar); *Colorado-Wyoming Gas Co. v. F.P.C.*, 324 U.S. 626 (similar; order affirmed in part, and cause remanded for further findings relative to the balance of the order); *Otis & Co. v. S.E.C.*, 323 U.S. 624 (reorganization plan under the Public Utility Holding Act); *United States v. Pennsylvania R. Co.*, 323 U.S. 612 (I.C.C. could require railroads to interchange their cars with Seatrain Lines, Inc., a connecting water carrier; and its order fixing \$1 per car day as compensation to railroads while water carrier actually had cars in its possession was sustained); *I.C.C. v. Parker*, 65 S. Ct. 1490 (operational authorization to a railroad's motor carrier valid); and see cases noted *supra* under Labor and Business dealing with the N.L.R.B. and F.T.C.

Reversal has followed, however, where the commission has failed to follow the statutory procedure for notice and hearing, *Ashbucker Radio Corp. v. F.C.C.*, 14 L.W. 4029; excluded relevant and substantial evidence, *American Trucking Ass'n v. United States*, 65 S. Ct. 1499 (I.C.C.); made findings not adequate nor supported by evidence, *North Carolina v. United States*, 325 U.S. 507 (I.C.C.), *Alabama v. United States*, 325 U.S. 535 (I.C.C.); erred in construing substantive statutory provisions, *Connecticut Light & Power Co. v. F.P.C.*, 324 U.S. 515, *Barrett Line v. United States*, 65 S. Ct. 1504 (I.C.C.); or transgressed the policy behind the finality of judgments, *International Union of Mine, Mill & Smelter Workers, etc. v. Eagle-Picher Mining & Smelting Co.*, 325 U.S. 335.

Law Reform and Legal Education. Revision of the Judicial Code, which deals with the jurisdiction and judicial machinery of the Federal Court system is proceeding. Two preliminary drafts have been made public; at least another draft will be before the reviser's finished product goes to Congress for enactment. The Supreme Court's Advisory Committee on Rules of Civil Procedure still has under consideration proposed amendments to these Rules, which since 1938, their effective date, have significantly proved their merit in uniting the "law" and "equity" procedures of the Federal Courts and modernizing and simplifying federal practice. The proposed amendments are mainly clarifying, not basic in character.

Legal education during the war came to a standstill. Student enrollment materially decreased, in some schools to the vanishing point; some law schools closed their doors, all trimmed and reduced their faculties and activities to a bare minimum. With cessation of hostilities, a tremendous demand for legal education has arisen. All law schools, even those that normally accept limited numbers, are faced with the problem of accommodating more students than ever, due to the increasing interest in legal education and the backlog that has accumulated during the past five years. In addition, law schools face problems pertaining to returning veterans—readjusting them to scholarly pursuits and in many cases refreshing them as to legal materials covered prior to military service; the need to restaff depleted faculties, and to bring casebooks and other teaching materials up to date; and the necessity to keep the curriculum abreast of a swiftly moving society. (On this latter problem, see *The Place of Skills in Legal Education (Report of the Committee on Curriculum, Association of American Law Schools)*, 45 Col. L. Rev. 345.) The proper solution of these problems lies in giving due weight to scholarship, individual character, and integrity of him who would be a lawyer; and in properly evaluating the demands of an organized society

against the correlative rights of the governed. It demands a tolerant, visionary approach tempered with much practical judgment. The finest opportunity of a generation now lies before the law schools.

JAMES WAI. MOORE.

LEAD. The United States struggled through the final phases of the war and the early months of reconversion unable to mine or import sufficient lead to meet consumption requirements. At the end of 1945, lead was one of the three metals whose distribution still was controlled closely by the government, a far cry from the early days of the war when it was one of the few in excess supply.

Dwindling lead deposits yielded only 388,104 net tons of metal during the year (1944, 416,861 net tons; 1943, 453,313 net tons). As with other mining activities, shortage of manpower was a determining factor, and mine production was estimated to be only about 65 per cent of potential capacity. The southeastern Missouri district continued to be the largest producing area, accounting for about 45 per cent of the national output, with the far Western states together contributing about 45 per cent. The Coeur d'Alene district of northern Idaho was the largest Western producing region. The government sponsored premium price plan, under which the mines are paid a premium for mining ores which otherwise would be unprofitable, continued in operation, but is scheduled to end June 30, 1946. Thus, the mines received an average of 8.6 cents per lb. for lead produced during 1945 compared to a ceiling market price of 6.50 cents. It is estimated by Elmer W. Pehrson, chief of economics and statistics branch, U.S. Bureau of Mines, that lead ore reserves of the United States are sufficient to supply domestic consumption for only 12 years at the average 1935-39 annual rate of use. Imported ores in 1945 supplemented domestic ores to permit a production by United States refineries of 530,000 tons of refined and anthomonal lead.

Secondary recovery of lead from scrap was about 340,000 tons, the greater part of it from battery plates, during 1945. This was about the same as during 1944 and 1943, when 331,416 tons and 342,094 tons, respectively, were recovered.

Domestic refinery and smelter production was augmented by the importation of 230,000 tons of pig lead, about 75 per cent of it from Mexico and a substantial tonnage from Peru, Canada, and Australia. Some matte and concentrates came from Australia, Peru, Newfoundland, and Central and South American countries. Part of the Mexican and Peruvian metal production was diverted to Europe in the latter part of the year.

Domestic production and imports failed to meet a continued demand, and withdrawals from the government stockpile brought its level down to about 68,700 tons at the end of the year. Further withdrawals are probable in 1946, according to the Civilian Production Administration.

Difficulty in increasing imports lay principally in a world-wide shortage due to dislocation of producing areas. Silesian and Yugoslavian lead mines, which normally supply western Europe, have diverted their entire output to Russia. Little can be expected from Burma, whose railroads were destroyed by the Japanese.

CHARLES T. POST.

LEAGUE OF NATIONS. Three general objectives underlay League of Nations activities during 1945: first, to maintain as fully as possible the technical

and other services which had survived five years of war; second, to contribute out of the League's quarter-century's experience to the elaboration of the new United Nations agency; and third, to make ready for the transfer of its remaining activities and assets to that agency.

This latter problem became an active subject of negotiation during the year as World War II came to an end and a new international organization came into being. What to do about the innumerable duties entrusted to the League in several hundred treaties, the various territories around the world still under mandate by it, the superb buildings at Geneva, and the small but highly experienced staff which had remained steadfast during five years of war was a highly complex problem.

The outstanding event in the field of international organization was the San Francisco Conference for the creation of a new agency. The League, its affiliated agencies of Court and Labor Office, and two United Nations agencies were invited to send representatives, the first-named delegating its Acting Secretary-General, Sean Lester, its Treasurer, Seymour Jacklin, and its Senior Director, A. Love-day. League experience and work was constantly referred to throughout the conference, which agreed on a Charter very similar to the Covenant.

The Conference entrusted to the new agency's Preparatory Commission the duty to "formulate recommendations concerning the possible transfer of certain functions, activities, and assets of the League of Nations which it may be considered desirable for the new Organization to take over." The Executive Committee, meeting in London in August, worked out detailed recommendations which were approved by the full Commission in December and forwarded to the Assembly scheduled for January.

On the League side, the Supervisory Commission, which in the war years had met mostly in Montreal, returned to Europe for meetings in Geneva, Paris, and London, and considered all the aspects of this problem. At the same time, studies were issued on various aspects of League work bringing together the accumulated experience of two decades of international cooperation, including a complete review of the mandates system which was being paralleled in the United Nations trusteeship system, a compilation of a century's convention-making in the field of communications, and Volume 2 of the *Report of the Delegation on Economic Depression*. Three books by former Secretariat officials were issued by the Carnegie Endowment on the protection of national minorities by P. de Azcarate, the international secretariat by Egon F. Ranshofen-Wertheimer, and the organization of international conferences by Vladimir D. Pastuhov.

Certain technical work continued, though with changes, as in previous years. The first actual transfer of personnel from the League to the United Nations took place early in the year when the Health Research Unit in Washington became the nucleus of UNRRA's Epidemiological Information Service. The Anti-Narcotics work continued active, the two supervisory committees meeting in London but the staff gradually returning from Washington to Geneva. The largest and most important single group continued to be the Economic, Financial, and Transit Mission, which was in its fifth year at the Institute for Advanced Study in Princeton.

Several conferences also were held in connection with other international agencies working in fields associated with the League. The International Labor Organization initiated at Paris steps long

contemplated to make itself independent of the administrative links originally attaching it to the League, notably in the fields of finance, membership, and election. The United Nations Educational, Scientific, and Cultural Conference in London laid the basis of a larger and more formal agency than the League's Organization and Institute of Intellectual Cooperation. Another group met in Washington to lay the groundwork in the field of health, where the League had had great success, and still other steps were taken for the creation of an agency of commercial policy. In all this, League experience and often League personnel played an important part.

Finally, a revision of judgment as to the League was discernible in many quarters, particularly British and American. As the new agency was coming into being on lines very similar to the League but with a greatly strengthened membership, it became increasingly stressed that it could not succeed on its own but must have the support of all states, and particularly the big states, the lack of which was more and more recognized as the cause of the League's difficulties.

ARTHUR SWEETSER.

LEND-LEASE PROGRAM. Victory over Germany and Japan brought to a close the lend-lease program which began in March, 1941, and which contributed so much to the winning of the war. Negotiations with the countries which had received lend-lease aid were begun immediately for winding up their lend-lease programs including the sale to them of lend-lease goods then on hand or in the process of delivery.

From March 11 to May 2, 1941, Lend-Lease operations were handled by the President's Liaison Committee, headed by Maj. Gen. James H. Burns, in the Office of the Secretary of the Treasury. On May 2, 1941, the work of this committee was entrusted to the Division of Defense Aid Reports in the Office for Emergency Management. This Division had the job of coordinating the efforts of the various government departments concerned with the lend-lease program.

Since the program was rapidly growing in size and complexity, a separate agency—the Office of Lend-Lease Administration—was established on Oct. 28, 1941, with Edward R. Stettinius, Jr., as Administrator. The Office of Lend-Lease Administration acted as a sort of "holding company" for lend-lease activities. Its functions were policy making, coordinating, expediting, and record keeping. On Sept. 25, 1943, the President issued an executive order coordinating the civilian agencies operating in the foreign economic field, including the Lend-Lease Administration, in a new agency, the Foreign Economic Administration (q.v.) headed by Leo T. Crowley. The Foreign Economic Administration was abolished on Oct. 20, 1945, and lend-lease functions were transferred to the Department of State where they have been integrated with the disposal of surplus army and navy property abroad under the Foreign Liquidation Commissioner.

In order to integrate the entire war effort of the United States, procurement of lend-lease goods and services was handled by the regular Government procuring agencies—military goods and services by the War and Navy Departments, merchant ships by the Maritime Commission, the charter and hire of ocean transport by the War Shipping Administration, foodstuffs and agricultural commodities by the Department of Agriculture, and industrial and other nonmilitary products by the Procurement Division of the Treasury Department.

Other agencies concerned with the lend-lease program had the following responsibilities: the State Department for negotiating Lend-Lease Agreements with foreign countries; the Munitions Assignment Board for the assignment of munitions, the War Production Board for the allocation of industrial materials; the Petroleum Administration for War for the programming of the production and refining of petroleum products; and the Food Requirements and Allocations Committee of the War Food Administration for the allocation of foodstuffs. (See the articles on these agencies.)

Before the United States entered the war, Congress made all appropriations of lend-lease funds direct to the President. During the war it continued to make funds available in this manner for nonmilitary goods and services, but appropriated money direct to the Army and Navy for the munitions requirements of our Allies. As of V-J Day, a total of \$30,697,498,000 had been appropriated to the President. In addition, there had been authorized the transfer of up to \$35,970,000,000 of military goods and services procured with appropriations to the Army, Navy, and Maritime Commission.

By the end of the war, the President had declared the following countries eligible for lend-lease aid: Argentina, Belgium, Bolivia, Brazil, British Commonwealth, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, Iran, Iraq, Liberia, Mexico, Netherlands, Nicaragua, Norway, Panama, Paraguay, Peru, Poland, Saudi Arabia, Turkey, U.S.S.R., Uruguay, Venezuela, Yugoslavia.

Lend-lease accounted for about 15 per cent of the total United States war expenditures. From Mar. 11, 1941, to Dec. 1, 1945, lend-lease aid—goods transferred and services rendered—totaled \$49,096,000,000. Of this amount, \$1,519,000,000 was furnished in 1941, \$7,184,000,000 in 1942, \$13,748,000,000 in 1943, \$15,144,000,000 in 1944 and \$11,501,000,000 in 1945.

Transfers of munitions accounted for 47 per cent of the total, industrial items for 22 per cent, petroleum products 5 per cent, and foodstuffs and agricultural products 13 per cent. Eight per cent consisted of services rendered. These services included the repair of United Nations vessels in American shipyards, the charter and hire of merchant ships to carry lend-lease goods, the ferrying of aircraft, and the training of United Nations pilots in this country. Charges not distributed by foreign governments accounted for the remaining 5 per cent.

From Mar. 11, 1941, to Dec. 31, 1945, shipments of lend-lease goods totaled \$32,881,000,000. Of this, \$13,889,000,000 went to the United Kingdom; \$9,554,000,000 to the U.S.S.R.; \$3,406,000,000 to Africa, the Middle East, and the Mediterranean Area.

Approximately 98 per cent of all lend-lease aid was sent to our four major fighting partners—the British Commonwealth, the Soviet Union, France, and China. Lend-lease shipments to the various European war theaters totaled \$28,000,000,000. This included shipments to the United Kingdom, the Soviet Union, Africa, the Middle East, the Mediterranean area, and continental Europe.

Shipments to the United Kingdom comprised munitions for offensive action against the enemy, industrial materials for the fabrication of military goods, and foodstuffs for soldiers and war workers. Munitions accounted for 50 per cent of total ship-

ments, industrial items for 25 per cent, and food-stuffs and other agricultural products the remaining 25.

Shipments to our Pacific Allies for the war against Japan totalled more than 4 billion dollars. The Asiatic and Pacific theaters received 8,800 lend-lease planes, more than 3,200 tanks, and 210,000 motor vehicles.

Among the finished munitions sent to Soviet Russia, there have been over 14,600 planes (more than to any other lend-lease country), 7,000 tanks, 135,000 sub-machine guns, and 487,000 motor vehicles. We have also sent for the Russian armies 422,000 field telephones and 1,105,000 miles of field telephone wire for the maintenance of their long lines of communication.

We sent to the United Kingdom under lend-lease, from the beginning of the program in March 1941 to Sept. 30, 1945, 10,700 planes, 12,750 tanks, 95,000 motor vehicles, 47,000,000 tons of petroleum products, 7,500,000 tons of iron and steel, 590,000 tons of nonferrous materials, 1,155,000 tons of fertilizer and 7,078,000 tons of food.

In addition to goods shipped to the various theaters of war, lend-lease helped to develop and maintain the supply lines of the United Nations. Many ships built in the United States with lend-lease funds were transferred for the duration to Great Britain, the U.S.S.R., and other United Nations. Air routes were developed from the United States to the Middle East, U.S.S.R., India, and Australia. Lend-lease financed in varying degree the construction of pipelines, supplying depots, docks, warehouses, railroads and rolling stock, and plane and truck assembly and repair shops.

Reverse Lend-Lease. In keeping with the concept of lend-lease as a pool of resources to which each of the United Nations contributes according to its ability, our Allies furnished under reverse lend-lease to July 1, 1945, goods and services amounting to \$6,256,871,000.

Reverse lend-lease aid from the United Kingdom to July 1, 1945 had a dollar value of \$4,220,000. From the day our soldiers first arrived in the United Kingdom in 1942, one-third of all the supplies and equipment required by United States troops in the British Isles was thus provided.

In addition to the tonnage of supplies and equipment for our forces, reverse lend-lease aid from the United Kingdom included new construction for United States Air and Ground Force bases, camps, supply and repair depots, and other installations. Almost one-third of Great Britain's total building labor force was at one time employed on this program. Services included not only the transportation of hundreds of thousands of American soldiers in British ships across the Atlantic, together with repairs, fuel and stores for our ships in British ports, but also the cost of the telephone, telegraph, postal, radio, railroad and other transportation and communication services in the United Kingdom.

Reverse supplies from Australia and New Zealand totaled \$1,039,570,000 up to July 1, 1945. The total in India was \$639,443,000 to July 1, 1945.

See GREAT BRITAIN under Anglo-American Relations; PROCUREMENT DIVISION; UNITED STATES under Enactments; also, the countries involved under Events, especially Australia, El Salvador, New Zealand, Turkey.

THOMAS B. MCCABE.

LIBERAL PARTY. A political party organized in New York State, May 19, 1944, by members of the right wing of the American Labor Party (who had lost

control of that Party to a coalition of the left wing) and other affiliated groups. John L. Childs is State Chairman; David Dubinsky is First Vice-Chairman; and Joseph V. O'Leary is Secretary.

LIBERIA. A Negro Republic, founded in 1847 by freed slaves from the United States, on the west coast of Africa between Sierra Leone and the Ivory Coast. Capital, Monrovia (population, about 10,000).

Government. The frame of government is modeled after that of the United States. There is a President and his Cabinet, a Senate and a House of Representatives. The President, elected in 1943 for the term 1944-52, is William V. S. Tubman of the True Whig Party. This party is controlled by a small oligarchy of American-Liberian families dwelling in the few coastal cities, for the franchise is restricted to Negro landowners. This party has pretty well monopolized political power in the Republic for the last three generations. The real natives of the country have little or no voice in the national administration.

In recent years the government's revenue has exceeded expenditures, the relevant figures for 1943 being \$1,429,936 and \$1,044,647 (in 1942 the exchange rate was fixed at \$4.80 to the Pound, or \$4 United States currency). Customs receipts account for half of the income; while debt charges, interest and amortization absorb one-fifth of the outgo. Under the terms of the Loan Agreement with the United States, Librarian finances are supervised by American experts. A first charge on all revenues is the service on the American loan. The external bonded debt as of Jan. 1, 1944 was \$1,193,000.

The armed forces consist of a militia of some 4,000 men and an enlisted Frontier Force of over 1,200. According to an agreement signed on March 31, 1942, the United States Government undertook to extend financial and technical assistance for organizing Liberian defense forces. Liberia also permitted the United States to exercise military control over certain of the country's airfields and defense areas. American troops arrived in Liberia in May 1942 to aid in defending the Republic for the duration of the war. Another agreement, signed on Dec. 31, 1943, implemented these previous commitments. Various technical missions and experts from the United States have been employed by the Liberian Government in recent years (see YEAR BOOK for 1944).

Events, 1945. The end of the war inevitably reduced the strategic and economic importance which Liberia had enjoyed during hostilities. That her wartime role had been important was emphasized by the American Secretary of State, Mr. Stettinius, when he visited Monrovia in mid-February en route from the Yalta meeting to the Mexico City Conference. He particularly mentioned the Republic's rubber production as a vital element in Allied success.

In November the Firestone Company announced that the rubber crop for 1945 was expected to total 41,000,000 pounds, an increase of 4,000,000 over 1944. According to this statement, 80,000 out of the 200,000 acres leased in Liberia had already been cleared and planted with some 10,000,000 rubber trees. Altogether there were 55,758 acres of producing trees. These plantations employed 25,000 native workers, under the supervision of 150 "staff men."

On April 2 the Liberian delegation to the San Francisco Conference arrived in New York, led by Vice-President Clarence L. Simpson and including

the Secretary of State, Gabriel Dennis. At San Francisco the delegation defended the rights of small nations and supported proposals for internationalizing the administration of colonial areas.

On Sept. 13 an examiner for the United States Civil Aeronautics Board recommended that Pan American Airways, which had already pioneered transatlantic services to Africa, be given the sole right to fly an American route to South Africa via the Azores and Monrovia. This was hailed in Liberia as assuring to the Negro Republic a place on one of the world's principal airways.

Characteristics of the Population. No proper census has ever been taken, and the population is estimated at anywhere from one to two million. Only about 60,000 of the coast Negroes are considered civilized by European standards. Among them are some 12,000 American-Liberians—the descendants of freed slaves from the United States—who form the governing and intellectual class. The natives are divided among six principal stocks and various smaller tribes. The Mandingoes are Moslems and most of the rest are pagans, though various Christian missions are operating in the country. English is the language of government and commerce. In 1944 there were 190 schools (78 run by the Government), of which two were of college rank. The great mass of the Liberian people is illiterate and wholly innocent of any formal education.

Economy. Most of the inhabitants, living in a tribal state, participate little or not at all in the world's money economy. Such resources as the country possesses are largely undeveloped. Almost the only export is raw rubber, produced on the Firestone plantations and shipped out through the port of Marshall, east of Monrovia. In 1943 exports were valued at \$8,997,896 and imports (largely manufactured goods) at \$4,679,602. There are no railways and very few roads, though the latter are being extended here and there, and no interior telegraph or telephone communications. There are several ports, but none with facilities for servicing vessels at docks; all operations are carried on by lighter. In 1943 the number of ships entering these ports was 63, of which 49 were American.

ROBERT GALE WOOLBERT.

LIBRARY OF CONGRESS. Dr. Luther Harris Evans, the Chief Assistant Librarian, assumed the duties of Acting Librarian after the resignation of Mr. Archibald MacLeish, the Librarian of Congress, in December 1944 to accept an appointment as Assistant Secretary of State. The Senate unanimously confirmed President Truman's nomination of Dr. Evans on June 18 and the new Librarian entered office as the tenth Librarian of Congress on June 29.

The Library's major problem centered on obtaining materials reflecting the Government's war program. With the war's end, the problem developed into one of acquiring publications that were inaccessible during the war. With this aim the Library attempted, through cooperative enterprise, to secure all pertinent foreign materials covering the war period for its collections and for other collections in the country.

To promote greater Pan-American cooperation and common knowledge, the Library established and published the first two issues of *The United States Quarterly Book List* under the editorship of Dr. Joseph P. Blickensderfer. This was in accordance with a recommendation included in the Final Act of the Inter-American Conference for the Maintenance of Peace, held at Buenos Aires in 1936, that each American Republic issue a quarterly devoted to recently published works in sci-

ence, history, literature, and art, to be distributed and exchanged among the American Republics.

In celebration of the twentieth anniversary of the establishment of the Coolidge Foundation in the Library of Congress, the Foundation sponsored its tenth festival of chamber music. Three new ballets by Aaron Copland, Paul Hindemith, and Darius Milhaud, a "Partita" for organ and strings by Walter Piston, all commissioned by the Foundation, and two works for two pianos—a "Sonata" by Igor Stravinsky and "Second Avenue Waltzes" by Vittorio Rieti—received their world premières. The Copland ballet "Appalachian Spring," received the Pulitzer Prize for the outstanding American composition of the year and citation as the best theatrical work of the season.

A program of Grants-in-Aid for Studies in American History and Civilization was established by the Library on the basis of a subvention from the Rockefeller Foundation.

An important initial step toward the establishment of the proposed Slavic Center was afforded by a grant of \$47,800 from the Rockefeller Foundation.

Special books and talking book machines for the use of veterans in hospitals and for the continuation of this service in their homes resulted from a series of conferences on the use of the Library's facilities for the Adult Blind Division in the program for the rehabilitation of war-blinded servicemen.

To save time and work, the Library of Congress established a library, as desired by the Department of State, for the United Nations Conference on International Organization at San Francisco. Delegations of all participating nations were permitted to use the resources of this library, containing 3,000 basic volumes supplemented by inter-library loans from cooperating libraries in the area. The function of the conference library was unique; there was no previous record of a special library service for the use of all delegations to an international conference.

The collection of the Library, at the end of the fiscal year, June 30, 1945, included 7,877,002 printed books and pamphlets, 1,703,599 volumes and pieces of music, 1,639,505 maps and views, 575,083 fine prints, 936,412 photographic negatives, prints, and slides, more than 7,900,000 manuscripts, 43,343 microfilm reels and strips, 11,955 motion picture reels, and 123,134 phonographic recordings.

LIBRARY PROGRESS. With the end of World War II, libraries and librarians throughout the nation attacked the problems of demobilization, readjustment, reconversion, and international relations for a postwar world. One of the major problems ahead continued to be the extension of libraries to areas without them. Although, according to the annual report of the Library Extension Board of the American Library Association, the number of people in the U. S. unserved by libraries was reduced from 45,069,897 in 1920 to 34,748,334 in 1945, nearly 26% of the U. S. population were still without libraries.

Many thousands of schools were also without libraries.

Extension of Library Service. Considerable progress has been made in the United States and Canada, however, since the A.L.A. Library Extension Board was established twenty years ago. Advances in state, federal and local legislation, more generous appropriations, and the development of large-unit libraries mark progress within

this period. State aid appropriations were made for the first time in 1945 in Washington, Maryland, New Mexico and South Carolina. Appropriations for state library extension agencies were generally increased (in several states more than 50 percent) and a small first appropriation was made in Montana.

Libraries, Librarians and the Negro (School of Library Service, Atlanta University, 1944) states that in the Southern states service to Negroes is now promised by 121 public library systems giving library facilities to 25.2 percent of the Negroes whereas in 1926, 55 public library systems provided service for 11 percent of the Negro population. The service increase is in the urban areas.

Work and activities of libraries and the American Library Association in connection with these problems are reported in more detail in the 1945 issues of the *A.L.A. Bulletin*, *College and Research Libraries*, and the *Library Journal*.

Federal and State Relations. In recent years the interest of libraries in Washington affairs has grown. They have been concerned with work relief projects, information programs relating to war and peace, legislation and government regulations affecting library service. During the war, war-information centers in libraries were an effective means of diffusing essential information of a more substantial kind than was easily available elsewhere. Government agencies urged people to "consult your library" in connection with information on peace policies and programs. Much planning and work went into the preparation for maximum library information-and-education service for returning veterans and for newly dislocated war workers, into planning for library use of surplus property, for possible public works legislation, and for other forms of federal assistance in state and local library service. In order to carry on these and other projects librarians, through the American Library Association, set out during the year to raise a Library Development Fund of \$105,000 and with the proceeds established in October, 1945 an A.L.A. National Relations Office at 1709 M St., N.W., Washington 6, D. C., with Paul Howard, formerly librarian of Gary, Ind., as director.

Among the activities of the Library Service Division of the U. S. Office of Education and of the American Library Association were efforts to maintain favorable book postage rates for libraries. It is estimated that agreements reached will prevent an additional annual charge of more than \$100,000 in postal rates on library book orders.

Professional Training and Personnel. During the year A.L.A. queried some 1,400 of its members in the armed forces, and in Army and Navy library services, on their impressions about their own future and the future of libraries. The answers indicated that most of them wished to return to library work, that they expected higher salaries, better working conditions, more opportunity for creative work, and advancement. Many want refresher courses before returning to regular jobs (some expect to take advantage of the G. I. Bill of Rights for library training) or suggest in-service training.

The A.L.A. Board of Education for Librarianship has given special attention to the redirection of professional education in line with changing requirements for librarianship; to the need of recruiting more personnel for the profession and more scholarships in library schools; to certification; to accreditation; and to the needs of veterans for orientation or other special courses.

The demand for trained librarians continued to be greater than the supply even though there was a slight increase in salaries and in the number of students enrolled in the 32 accredited library schools in the U. S.

International Relations. Much has been done during the year by American librarians toward assisting librarians and libraries in Latin America, China, and devastated European war areas. Of particular importance in 1945 were the place of education and cultural relations in the San Francisco charter; libraries and the proposed Educational and Cultural Organizations of the United Nations; disposal of surplus Army books abroad; the Book Campaign for devastated libraries in war areas; the planning for international indexes and bibliographies; importation of foreign books and periodicals; re-establishment of exchange between universities and other scholarly organizations in the U. S. and abroad; U. S. help in the rehabilitation of foreign libraries and library schools; interchange of librarians with foreign countries; and the maintenance of U. S. information libraries in foreign countries. Those administered by the OWI were transferred to the U. S. Department of State when the war ended. In addition, there have been many campaigns conducted by various nationality groups, to collect American books for specific countries of Europe. It is hoped that independent campaigns for books will be merged with that of the American Book Center, Inc., which was organized to coordinate all efforts in behalf of all countries where libraries have suffered through the war.

Books and Reading. The Council on Books in Wartime increased its service editions of books to 140,000 copies each of 32 titles published monthly and sent to the armed forces overseas and to Army and Navy hospitals in the U. S. The Library Section of the Special Services Division, Army Service Forces, reported a tremendous increase in the desire of American fighting men to read books. Although the Army had increased the supply of books from 20,000,000 to 50,000,000 a year there still were not enough.

The average American civilian was reading about his own personal problems first and about the war and the state of the world second, according to a survey of reading trends in over a hundred public libraries, conducted by the American Library Association. There was an increase in the circulation of books by libraries. For the first time since the U. S. began to prepare for war, libraries reported that the steady drop in circulation of books has ceased. The use of libraries for reference and information has never dropped and is still increasing.

An experiment in cooperative public opinion testing, "Do People Use Their Public Libraries," was completed during the year through the cooperation of the A.L.A., 17 libraries in metropolitan areas, and the National Opinion Research Center. Results were published in the *A.L.A. Bulletin* for Nov. 1945.

Grants, Gifts, and Buildings. A total of \$590,000 was received by the A.L.A. in grants ranging from \$1,000 to \$105,000 for some 25 special projects during the fiscal year ending Aug. 31, 1945. In addition, grants and funds of varying amounts have been made available by different groups and foundations to many libraries for specific purposes.

Private collections and funds given to libraries included: to Stanford University Library, the Hutton Webster Folklore Collection; to the library

of Southern Illinois Normal University, a Lincoln and American history collection donated by Clint Clay Tilton; to University of Illinois Library, a 6,000 volume economics library from Janet Weston, in honor of her father; to Minneapolis Public Library, \$50,000 from the Citizens Aid Society; to Columbia University Library, a collection of classics and incunabula from the late Dr. Gonzalez Lodge; to The Free Library of Philadelphia, 17th century Shakespeare folios by P. A. Widener and Mrs. Josephine Widener Wichfeld; to Texas Christian University Library, de luxe limited editions of American, English, and French literature and history from Mrs. Goodall H. Wooten; to the town of Muscoda, Wis., the library, home and personal property of Dr. Charles R. Pickering; to the Tulsa Public Library, the Diggs library of classical literature and history by the Tulsa Jewish Community Council; to the University of Arizona Library, several thousand books, valued at over \$10,000 from the Friends of the Library; to the Princeton (Ill.) Public Library, \$10,000 from the estate of Alfred Norris; to the Montezuma (Ind.) Public Library, the library and art collection of the late Lula J. Case; to the Macalester College Library (St. Paul) the greatest collection of America hymnology in the U.S., from Arthur Billings Hunt; and to the Library Association of Portland (Ore.) a bequest of income amounting to about \$2,500 a year for books from the will of Thomas Roberts.

Funds given for buildings included: to Newark (Ohio) Public Library, \$27,500 under the will of Mrs. Jessie Clark Thomas, to Cairo (Ga.) Public Library, \$35,000 by the Roddenberg family; to the Kewanee (Ill.) Public Library, a \$25,000 trust fund in memory of Edward Poole Lay, to the Jewell (Ia.) Public Library, \$25,000 for the establishment of the E. W. Montgomery Memorial Library; to the Avon (Mass.) Public Library, \$82,000 from the will of H. Lawton Blanchard; to Princeton University, \$1,000,000 from the Firestone family toward a \$3,500,000 Harvey S. Firestone Memorial Library; to the Elmwood (R.I.) Public Library, \$100,000 through the will of Mrs. Sophie Knight Rousmanieve; to the Pomeroy (Wash.) Public Library, \$10,000 from Mary Liggett; to Walla Walla (Wash.) Public Library, \$20,000 by the will of T. C. Elliott; to Lake Geneva (Wis.) Public Library, \$100,000 from Mrs. Mary Gridley Bell; to Bradley Polytechnic Institute, Peoria, Ill., \$37,500 from Friends of the Library for a new library building; to the Birmingham Public Library, a residence and funds for a branch library from Dr. and Mrs. Thomas D. Parker; to Florence, Ala., \$25,000 from the Rosenbaum family plus \$11,000 and local buildings from other individuals for a city-county library building and a bookmobile for rural service from the American Legion post; and to Baldwin-Wallace College, Berea, Ohio, \$152,000 from George W. Ritter for a library building; to the Technological Department of the Carnegie Library of Pittsburgh, \$66,195 from the Pittsburgh chapter of the American Chemical Society to supplement regular book funds.

Very little new library construction has been done during the war years but plans for buildings are being made by many libraries. The following are among those with funds available for buildings: Oakland (Calif.) Public Library, California Academy of Science, Paine College Library (Augusta, Ga.), University of Iowa Library, Forbes Library (Williamstown, Mass.), Cincinnati Public Library, and San Diego Public Library. Many war memorials will take the form

of library buildings or book collections, including the national memorial to Ernie Pyle in Dana, Indiana.

Publications. Among the books published by the A.L.A. in addition to its five regular periodicals were, *School Libraries for Today and Tomorrow*, *Librarian and the Teacher of Home Economics*, *Catalogers' and Classifiers' Yearbook No. 11*, *Patrons Are People*, *Activity Book No. Two*, *Buying List of Books for Small Libraries*, 7th ed., and *Books Published in the United States, 1939-43*. During the fall of 1945 the A.L.A. began the distribution of phonograph recordings of classic children's stories told by Mrs. Gudrun Thorne-Thomsen. This project is in cooperation with the A.L.A. Division of Libraries for Children and Young People, which is interested in the preservation of fine examples of the storyteller's art.

Among the books in the library field issued by other publishers were: Carnovsky and Martin, eds., *The Library in the Community* (University of Chicago); Rider, *The Scholar and the Future of the Research Library* (Hadham); Lydenberg and Archer, *The Care and Repair of Books* (Bowker); Rankin, *Children's Interests in Library Books of Fiction* (contributions to Education No. 906, Columbia University); Hackett, *Fifty Years of Best Sellers, 1895-1945* (Bowker); Davis, *Pictorial Library Primer* (Demco Library Supplies); Frederic G. Melcher, *Friendly Reminiscences of a Half Century Among Books and Bookmen* (Book Publishers' Bureau); and Wilson and Tauber, *The University Library: Its Organization, Administration and Functions* (University of Chicago).

See also *Library Association, American (A.L.A.)* under *Societies and Associations*.

MILDRED OTHMER PETERSON.

LIBYA. An Italian possession in North Africa, conquered by Allied forces under General Montgomery in the winter of 1942-43. Area, 679,358 square miles; population (January 1, 1939) 888,401. Of these 763,179 were Moslems, 30,046 Jews, 89,098 Italians, and 6,078 other Europeans (including many Maltese). By 1943 hardly any Italians remained in Cyrenaica (the eastern part of Libya), while some 40,000 remained in Tripolitania (the western part). Capital, Tripoli.

The Fascist regime divided the country into four coastal provinces—Tripoli, Misurata, Bengasi and Derna—and a Military Territory of the South comprising the very sparsely inhabited desert interior. In 1939 the four provinces were incorporated into the national territory of Italy. However, full citizenship was not awarded to the native population. Various other political, economic, and cultural discriminations were also enforced against the natives and in favor of Italian colonists. Libya is now under British military administration.

By 1939 much of the internal economy and foreign trade of Libya had become artificial as a result of Fascist autarchic policies. The region is devoid of any important natural resources, mineral or otherwise. Only under the impetus of large-scale government-spending programs could Libya's agriculture be made to produce exportable surpluses of cereals, fruits, and vegetables. The colony's foreign trade was largely with Italy, the latter accounting for over 90 percent of both its imports and exports. (See *YEAR BOOK* for 1943, page 337, for latest available statistics.)

Events, 1945. The Italian Government, whether presided over by Ivanoe Bonomi or by Ferruccio Parri, continued to ask the United Nations not to

divest their country of its North and East African colonies acquired before the advent of Fascism. However, on Jan. 17 Foreign Secretary Anthony Eden reaffirmed to the House of Commons his declaration of Oct. 4, 1944, that "the Italian Government had no right to the return of any one of their colonies." The British Government was even more definitely committed against the retention of Italian sovereignty over Cyrenaica.

The Conference of Ministers of the Big Five, which began its meetings in London on September 10, had as one of the first items on its agenda the framing of a treaty of peace with Italy. This would of course have involved the question of what was to be done with Libya. Among the possibilities were the creation of a UNO trusteeship (under one or more of the United Nations, or perhaps even under Italy), or the division of the country between France and Egypt (the latter was known to have designs on Cyrenaica). But when the Soviet delegation revealed Russia's desire to obtain the trusteeship for Libya, the ensuing uproar resulted in a decision to postpone a solution of the whole Italian question until a later meeting.

The United States delegation on Sept. 22 released its proposals for the disposal of the Italian colonies. For Libya it suggested that the colony "be granted independence at the end of ten years. In this interval it will be under a United Nations Organization trusteeship agreement. This will provide for an administrator with full executive power appointed by and responsible to the Trusteeship Council of the United Nations Organization. To him will be attached an advisory committee of seven, composed of representatives of the United Kingdom, the Union of Soviet Socialist Republics, France, Italy, and the United States and a European and an Arab resident of Libya selected by the five Governments named."

The members of the newly organized Arab League naturally felt that Libya was within their range of interest. Indeed, unofficial delegates from Tripolitania and Cyrenaica went to the Cairo Conference of the Arab States in February and March to present their case for independence (see PAN-ARAB AFFAIRS). The League's Secretary General, Abdul Rahman Azzam Bey, therefore demanded of the Conference at London that it grant complete independence to Libya after an interim period of trusteeship under an Arab state acting on behalf of the UNO.

Beginning on November 6 bloody anti-Semitic riots broke out in Tripoli and in several neighboring cities. In all more than 100 Jews were killed and several hundreds wounded, in addition to the Arab casualties, and much property was looted or destroyed. Over 700 persons were arrested by the British military authorities on various charges. The exact cause or causes of these outbreaks among a usually pacific population was a matter of considerable speculation. Pan Arab instigation from the outside was suspected. The local Arab leaders publicly deplored and disavowed the actions of the Moslem element. Economic motives may also have played some part, though a more poverty-stricken community than that of the Jews of Tripoli would be hard to imagine.

ROBERT GALE WOOLBERT.

LIECHTENSTEIN. A principality in central Europe, adjoining Switzerland on the east. Area, 65 square miles. Population (1941 census), 11,218. Capital, Vaduz (2,020 inhabitants). Chief products: corn, wine, fruit, wood, marble. Main industries: cotton spinning and weaving, leather goods, pottery, and

livestock raising. Liechtenstein belongs to the Swiss Customs Union; Swiss currency is used. Budget estimates (1944): revenue 2,530,490 francs; expenditure 2,435,749 francs. Public debt, Dec. 31, 1944, 2,732,503 francs (Swiss franc was worth about \$0.23 in 1944). Reigning Prince, Francis Joseph II (succeeded Aug. 25, 1938).

LITERATURE, American and British. The reviewer of creative writing published in 1945 could not help being impressed, at year's end, by an odd upsurge of vitality and hope. This was surprising, since the political outlook could be called only dismaying, and the time from war's end was so short. Yet the vitality and hope were there. They were shown not in bulk of work published, for scarcity of materials still ruled on both sides of the Atlantic, but in tone. In fiction, poetry, drama, readers of English were asked to adventure, to experiment, to take a chance with new subjects and new techniques and to learn to understand strange ways, strange cultures, strange beliefs. Writers collectively seemed to be gathering themselves for a new productivity and creativeness, despite the many threats to the future of culture, even of mankind itself, and despite the gloom and despair still abundant in their subject matter. What writers said was often without hope, but the energy and effect somehow belied them. 1945, seen over-all, could only be considered highly promising for the cultural future.

Biography. As in many earlier years, American autobiography stood out in the year's work for interest and variety. George Santayana continued his *Persons and Places* with volume ii, *The Middle Years*. Morris L. Ernst, in *The Best Is Yet*, showed the causes that engage a New York City lawyer. Varian Fry's *Surrender on Demand* told how he helped refugees out of Nazi Europe. George and Helen Papashvily wrote in dialect about an immigrant from the Caucasus in *Anything Can Happen*. J. Frank Dobie's *A Texan in England* admired England. Esther Cloudman Dunn's *Pursuit of Understanding* dealt with education. Marquis James, in *The Cherokee Strip*, and Harvey Fergusson, in *Home in the West*, described Western childhoods, while Louis Bromfield's *Pleasant Valley* and Betty MacDonald's *The Egg and I* dealt with life on farms. Richard Wright's *Black Boy* pictured a horrifying Negro childhood, while *Lay My Burden Down*, edited by B.A. Botkin, contained narratives of slavery by surviving slaves. Marshall Field's *Freedom Is More Than a Word* indicated why he became a publisher. John M. Mecklin's *My Quest for Freedom* was for academic freedom. Walter B. Cannon's *The Way of an Investigator* pictured the life of a medical researcher. Charles Hanson Towne's *So Far So Good* showed how a New York editor lives. Sophie Tucker's *Some of These Days* and George Antheil's *Bad Boy of Music* dealt with show business. Louise Reid Spencer's *Guerilla Wife* described hiding from the Japs in the Philippines. W.W. Blackford's *War Years with Jeb Stuart*, Civil War memoirs, had been long unpublished. Margaret Emerson Bailey's *Goodbye, Proud World* presented a rebel from Providence, R.I. Dane Chandos' *Village in the Sun* described a year in Mexico. Ray Stannard Baker published *American Chronicle* and Oliver La Farge *Raw Material*. A mock-autobiography was *Joe the Wounded Tennis Player* by Morton Thompson, and Karl Eske-lund's *My Chinese Wife* was also humorous.

J. G. Randall published the highly praised volumes i and ii of *Lincoln the President*, to the Gettysburg address. H.C.F. Bell's *Woodrow Wil-*

son and the People began with his Princeton days. Claude G. Bowers' *The Young Jefferson 1743-1789* provided a first volume for his series already published, while Helen Duprey Bullock's *My Head and My Heart* told of Jefferson's love for Maria Cosway. Arthur Styron's *The Last of the Cocked Hats* was about James Monroe and the Virginia dynasty. George W. Norris wrote the autobiography of a *Fighting Liberal*. Frank Graham described *Al Smith, American* and David Hinshaw *A Man from Kansas*, William Allen White.

Fawn M. Brodie's *No Man Knows My History* revealed Joseph Smith, the Mormon prophet. David B. Steinman's *The Builders of the Bridge* was about the Roeblings, father and son. Joseph Cannon Bailey described the work of *Seaman A. Knapp: Schoolmaster of American Agriculture*. M.M. Musselman's father, an inventor, was shown in *Wheels in His Head*. Henry Wise Miller, in *All Our Lives: Alice Duer Miller*, showed an interesting woman and a happy marriage. Dorothy Caruso's *Enrico Caruso* gave the great singer. Samuel Hopkins Adams explained A. Woolcott: *His Life and His Work Robinson Crusoe, U.S.N.*, by Blake Clark, was about George Tweed, who dodged Japs on Guam. Carlton Brown's *Brainstorm* described a manic-depressive. Here was variety indeed.

Much good writing about British literary figures appeared, such as *The Letters and Private Papers of William Makepeace Thackeray*, volumes i and ii, edited by Gordon N. Ray; *The Trollopes*, by Lucy Poate Stebbins and Richard Poate Stebbins; *A Fellow of Infinite Jest*, Laurence Sterne, by Thomas Yoseloff, *The Profane Virtues*, by Peter Quennell, about Boswell, Gibbon, Sterne, and Wilkes; *The Shelley Legend*, by Robert Metcalf Smith and others, showing falsification in his earlier biography; *The Lambs*, by Katherine Anthony, an unsuccessful attempt to apply Freud; *William Ernest Henley*, by Jerome Hamilton Buckley; *Tom Paine*, by W.E. Woodward; *John Henry Newman*, by John Moody; *The Life of Edmund Spenser*, by Alexander C. Judson; and three valuable autobiographies: Sean O'Casey's third volume, *Drums under the Window*, about the Easter rebellion in Dublin; Lord Dunsany's *The Strens Wake*; Cyril Connolly's *The Unquiet Grave*, a year in the life of a litterateur. Other British biography included the final volume of *Rufus Isaacs, First Marquess of Reading*, by his son, Gertrude Lawrence's *A Star Danced*; Ronald Chapman's *The Laurel and the Thorn*, deriding its subject, G. F. Watts, and Robert Gibbings' *Lovely is the Lee*, a charming book.

Asiatic autobiography appeared in force, as Santha Rama Rau's *Home to India*; Hilda Wernher's *My Indian Family*; Krishna Nehru's *With No Regrets*, for agitation against the British Raj; John J. Espey's *Minor Heresies*, a Chinese boyhood; *A Daughter of Han*, autobiography of a Chinese working woman, set down by Ida Pruitt.

Lives of Europeans included: *The Life of the Heart*, George Sand, by Frances Winwar; *Flores-tan*, Robert Schumann, by Robert Haven Schauffler; *Copernicus and His World*, by Hermann Kesten; *Marta of Moscow*, Catherine I, by Phil Stong; *The Red Prelude*, Zhelyabov, assassin of Alexander II, by David Footman; *Teresa*; or, *Her Demon Lover*, the Countess Guiccioli, by Austin K. Gray; and among autobiographies: Gertrude Stein's *Wars I Have Seen*; Joseph Wechsberg's *Looking for a Bluebird*; Alexander Granach's *There Goes an Actor*. Stuart Cloete described Africans, Kruger, Rhodes, Lobengula, in *Against These Three*. Dale Carnegie's *Biographical Roundup* dealt with critical chance moments in many lives.

Criticism and History of Literature. *An Essay on Rime*, by Karl Shapiro, drew attention, because of the author's rising reputation as a poet, because this volume was in poetry on poetry, because of the judgments made. Similar in intention was *Poet to Poet: Great Poems about Great Poets*, edited by Houston Peterson and William S. Lynch. What happened to Emily Dickinson's poems was explained at last in Millicent Todd Bingham's *Ancestor's Brocades*.

Volume v, but the first to appear, of the new *Oxford History of English Literature* was Douglas Bush's *English Literature in the Earlier Seventeenth Century 1600-1660*. An amusing history was William Gaunt's *The Aesthetic Adventure*, about the art-for-art's-sakers. Cyril Connolly discussed the 1930's in *The Condemned Playground*. Pedro Henriquez-Urena's *Literary Currents in Hispanic America* brought history up to the war.

Harry Slochower, in *No Voice Is Wholly Lost*, assessed writers and thinkers in war and peace. Frederick J. Hoffman ranged widely in *Freudianism and the Literary Mind*. Hardin Craig was genial in *Literary Study and the Scholarly Profession*. James T. Farrell was not genial, and very Marxian, in *The League of Frightened Philistines*, about both contemporary and past figures. Kenneth Burke's *A Grammar of Motives* discussed language as used in literature and politics.

Harold Clurman's *The Fervent Years* gave the history of the Group Theatre. Una Ellis-Fermoor explored *The Frontiers of Drama*, while Harley Granville-Barker explained *The Use of the Drama*. Fiction writers were considered in: *Virginia Woolf*, by Joan Bennett; *Tobias Smollett*, by George M. Kahrl, and *The Career of Victor Hugo*, by Elliott M. Grant. Charles Frederick Harrold's *John Henry Newman* was partly biography but even more criticism, on the centennial of Newman's conversion.

Drama. Tennessee Williams, the year's apparition in American drama, published *The Glass Menagerie*, which seemed very thin on the page, and *Battle of Angels*, which had lots of blood and fibre. John van Druten, whose talent seemed undimmed by war, published the pleasant *I Remember Mama*. Other Broadway successes included: Philip Yordan's *Anna Lucasta*, Norman Krasna's *Dear Ruth*; Paul Osborn's *A Bell for Adano*; John Patrick's *The Hasty Heart*; Louis Solomon and Harold Buchman's *Snafu*; Laszlo Bus-Fekete and M. H. Fay's *Embezzled Heaven*. From Britain came: *The Banbury Nose*, by Peter Ustinov, hailed as the white hope of British drama; *Tedious and Brief*, and *Plays for Plain People*, by James Bridie, who once had been a white hope himself; *Three Comedies*, by J. B. Priestley, and *Emma*, adapted from Jane Austen by Gordon Glennon.

But the year was notable for the "unplayable" plays, which used the form to say something demanding the form. Such were: W. A. Diggins's *Millenium I*, about a future war between man and machines; or *The Pet Shop*, by Gustav Eckstein, in which animals played nations, or vice versa; or *The Bridge*, by Stanley Burnshaw, a symbolical play about arriving at the future.

A couple of interesting patriotic radio plays were Norman Corwin's *On a Note of Triumph*, for V-E day, and Stephen Vincent Benét's *United We Stand*. Christopher La Farge's *Mesa Verde* was a verse libretto for an opera.

Essays. In 1945 essays were truly miscellaneous. Jacques Barzun, in *Teacher in America*, wrote brilliantly about college education. H. G. Wells' *Mind at the End of Its Tether* prophesied man's near extinction. Max Lerner's *Public Journal* was made

from articles on wartime America. *City Development*, by Lewis Mumford, dealt with society's whole structure. Aldous Huxley's *The Perennial Philosophy* quoted mystics and provided a commentary. Henry Miller's *The Air-Conditioned Nightmare* attacked America. Bucklin Moon edited *Primer for White Folks*, on race relations. Stephen Leacock's *Last Leaves* were partly humorous, partly serious. *Kitchen Fugue*, by Sheila Kaye-Smith, was about cooking in wartime and other items. F. Scott Fitzgerald's *The Crack-up* was edited by Edmund Wilson from papers he left. Earl Wilson's *I Am Gazing into My 8-Ball* was gossipy and vulgar, and *Artie Greengroin, Pfc.*, by Harry Brown, was soldier humor. Lore and legend about railroads could be found in *Railroad Avenue*, by Freeman H. Hubbard. Two impressive anthologies were: *The Practical Cogitator*, edited by Charles P. Curtis, Jr., and Ferris Greenslet, and *A Treasury of Satire*, edited by Edgar Johnson.

Fiction. Most interesting was a group of "different" stories, such as E. B. White's *Stuart Little*, about a mouse, or James Thurber's *The White Deer*, a grown-up's fairy tale; or Kenneth Patchen's surrealism in *The Memoirs of a Shy Pornographer*; Rumer Godden's remarkable exercise in technique *Take Three Tenses*; Frederic Prokosch's *Age of Thunder* "dissolved in myth"; Peter Bowman's *Beach Red*, written in poetic prose, a line to a second, a chapter to a minute, in an attacking soldier's life; Robert Reynolds' *The Obscure Enemy*, violence, also described in poetic prose; MacKinlay Kantor's *Glory for Me*, about a returned veteran, in verse; Robert Lawson's *Mr. Wilmer*, to whom animals spoke. Many of these could only be called failures, but they looked forward.

More conventional and successful were James Ramsey Ullman's *The White Tower*, a mountain climbed by an unusual party; *Jassy*, by Norah Lofts, a rural English girl's romance; *The World, the Flesh, and Father Smith*, by Bruce Marshall, about a good priest; Hugh MacLennan's *Two Solitudes*, French versus British in Canada; *The Folded Leaf*, by William Maxwell, the friendship of two boys; *Interim*, by R. C. Hutchinson, an odd English family.

Sinclair Lewis studied husbands and wives in *Cass Timberlane*. *Three O'Clock Dinner*, by Josephine Pinckney, showed family conflicts in Charleston, S.C. Christopher Isherwood's *Prater Violets* gave topical overtones to movie-making. Pearl S. Buck's *Portrait of a Marriage* showed an artist coddled by his wife Angela Thirkell published *The Headmistress* and *Miss Bunting*, to her admirers' delight. A sinister woman appeared in Rosamund Lehmann's *The Ballad and the Source*. Edna Ferber's *Great Son* showed a Seattle family. Utopias were described in Marguerite Young's *Angel in the Forest*. Upton Sinclair's sixth in the Lanny Budd series was *Dragon Harvest*. Josiah E. Greene won a prize and exposed human nature on a dairy farm in *Not in Our Stars*. Evelyn Waugh's *Brideshead Revisited* was amusing satire. James Street's *The Gauntlet* showed the troubles of a clergyman. *The Happy Time*, by Robert Fontaine, was a childhood in Ottawa, and Dan Wickenden gave a family in *The Wayfarers*.

Impressive first novels included: Walter Karig's *Lower Than Angels*, naturalism about a city youth; Adria Locke Langley's *A Lion Is in the Streets*, about an American fascist politician; *The House in Clewe Street*, by Mary Lavin, an Irish small town; René Kuhn's *34 Charlton*, a girl's search for independence; Arthur Miller's *Focus*, about anti-semitism—race relations were the subject of many

novels and stories this year, but none seemed better than *Focus*; Ruth Peabody Harnden's *Bright Star or Dark*, about Irish intellectuals; Mary Main's *Memory and Desire* showed an Argentine estancia.

Latin America, in fact, was a favorite setting. Alice Tisdale Hobart's *The Peacock Sheds His Tale* was laid in Mexico and about landholders. Josephine Niggli published *Mexican Village*. Betty de Sherbinin analyzed Argentine life in *By Bread Alone*. But E. M. Almedingen's *Dasha* was laid in Russia, and Robert Standish's *The Small General* in China.

The ever-popular historical fiction included: Thomas B. Costain's best-selling *The Black Rose*, travel and romance in the 13th century; C. S. Forester's *Commodore Hornblower*, about naval war in the Baltic against Napoleon; Marjorie Coryn's *The Marriage of Josephine*, to Napoleon; Herbert Gorman's *The Wine of San Lorenzo*, careful history of the Mexican War, Oliver St. John Gogarty's *Mr. Petunia*, Virginia one hundred years ago; John Brett Robey's *The Innovator*, Jerusalem at the Crucifixion.

Novels prompted by the war included: John P. Marquand's *Repent in Haste*, a tale of a flyer, Susan Glaspell's *Judd Rankin's Daughter*, on the home front; Glenway Wescott's *Apartment in Athens*, relations between conquerors and conquered; J. B. Priestley's *Three Men in New Suits*, effects on typical English people; Alex Comfort's *The Power House*, attacking today's politics; Gerald Kersh's *Faces in a Dusty Picture*, the North African campaign; Richard Brooks' *The Brick Foxhole*, non-combatant soldiers; Albert J. Guerard's *Maquisard*, the French resistance; Storm Jameson's *The Journal of Mary Hervey Russell*, about war and writers. Nicholas Monsarrat's *Leave Canceled* showed 24 hours in lives of an officer and his bride.

James Hilton's *So Well Remembered* pictured a good man. Letitia Preston Osborne's *They Change Their Skies* showed cosmopolitans in Honduras. Henry Morton Robinson's *The Perfect Round* had to do with a merry-go-round and was full of ideas. Frank Baker's *Mr. Allenby Loses the Way* was also a novel of ideas, disguised. Walter Van Tilburg Clark described a boyhood in Reno in *The City of Trembling Leaves*.

Among collections of short stories appeared: *The Collected Stories of Ben Hecht*; *Trial Balance*, the collected stories of William March; *Pipe Night*, by John O'Hara, about shabby people; *The Thurber Carnival*, by James Thurber. *The Short Stories of Henry James*, edited by Clifton Fadiman; *The Demon Lover and Other Stories*, by Elizabeth Bowen; *A Short Wait between Trains*, about army life, by Robert McLaughlin; *The Friendly Persuasion*, about a family of Quakers, by Jessamyn West; *The Forest of the South*, Southern stories, by Caroline Gordon; *Short Stories*, all about boys, by James Street; *The Facts of Life*, mostly difficult and obscure, by Paul Goodman.

History. A young new talent appeared in Arthur M. Schlesinger, Jr., whose *The Age of Jackson* won universal acclaim. Much other good work was published in American history, however. George F. Willison described the Pilgrim Fathers entertainingly in *Saints and Strangers*. Louis Adamic's *A Nation of Nations* showed the non-Anglo-Saxon immigrant's place in American history. Stephen Bonsal's *When the French Were Here* was about the end of the Revolutionary War. Lincoln, the inexhaustible, supplied material for William E. Baringer's *A House Dividing: Lincoln as President-elect*, and Jay Monaghan's *Diplomat in Carpet Slippers*, about his management of foreign affairs. Thomas A. Bailey published *Woodrow Wil-*

son and the Great Betrayal and Alan Cranston *The Killing of the Peace*, both about the League of Nations issue, but the first anti-Wilson though pro-League. James Truslow Adams edited *Album of American History*, volume ii, illustrations of the period 1783-1853. Morris Zucker's *The Philosophy of American History* was an ambitious attempt to make prediction and control of history possible.

Regional histories, so prominent in American historiography in recent years, abounded. In the *Rivers of America* series appeared Julia Davis' *The Shenandoah*; Stanley Vestal's *The Missouri*; Anne B. Fisher's *The Salinas*; in the *American Lakes* series Harlan Hatcher's *Lake Erie* and Arthur Pound's *Lake Ontario*. Meridel Le Sueur published *North Star Country* about the Dakotas, Wisconsin, Minnesota, and upper Michigan, while Maurine Whipple exuberantly insisted *This Is the Place: Utah*. Struthers Burt wrote about *Philadelphia: City of Brotherly Love*. Fred A. Shannon described the use and abuse of our land resources from 1860-1897 in *The Farmer's Last Frontier*. Henry Christman described a mid-19th-century anti-rent rebellion in New York State in *Tin Horns and Calico*. Alice Marriott's *The Ten Grandmothers* was about the Kiowa tribe of Indians. George R. Stewart's *Names on the Land* showed how American places got named. Sylvian G. Kendall's *American Soldiers in Siberia* described the 1918-1920 intervention.

In British history appeared: Arthur Bryant's *The Years of Victory 1802-1812*; J. A. Williamson's *Great Britain and the Empire*; Helen Merrill Lynd's *England in the Eighteen-Eighties: Toward a Social Basis for Freedom*, about the measures for social betterment initiated then.

Ellsworth Huntington showed the effects of solar cycles on history in *Mainsprings of Civilization*, while Gen. J. F. C. Fuller's *Armament and History* was a little closer to earth. Very close in time were *The Story of the Second World War*, edited by Henry Steele Commager, and *Unconditional Surrender*, by Everett Holles, about the European war from the high point of German conquest to the end. Carlton J. H. Hayes defended his *Wartime Mission in Spain 1942-1945*. J. M. Thompson published *Leaders of the French Revolution*. Donald Culross Peattie's *Immortal Village* was a history of Venice, in Provence, through the centuries.

Poetry. Robert Frost amused readers with *A Masque of Reason*, a debate between God, Job, Job's wife, about God's ways. *The Collected Poetry of W. H. Auden* was severely edited by the author, as was John Crowe Ransom's *Selected Poems*. Perhaps the final book of new poems by Emily Dickinson, *Bolts of Melody*, was edited by Mabel Loomis Todd and Millicent Todd Bingham. British poets of established reputation who published this year included Walter de la Mare with *The Burning Glass and Other Poems*, Louis MacNeice with *Springboard: Poems 1941-1944*, Edith Sitwell with *The Song of the Cold*, C. Day Lewis with *Short Is the Time*, and Edmund Blunden with *Shells by a Stream*. Jeremy Ingalls' *Tahl* had the mixed reception usually given epics. Marsden Hartley's *Selected Poems* joined poetry and painting through subject. William Ellery Leonard's sonnet sequence, *A Man against Time*, described the love affair of an old man, while Paul Engle's sequence, *American Child*, was about parenthood. Volumes covering several years' previous publication, usually with some new work, included: *The Selected Poems, 1912-1944, of Alfred Kreymborg*; E. J. Pratt's *Collected Poems*; Sylvia Lynd's *Collected Poems*; *Poems 1920-1945*, by David Morton, Ogden Nash's *Many Long Years Ago*. Allen

Tate's *The Winter Sea* and Randall Jarrell's *Little Friend, Little Friend* represented the more difficult American poets, while Robert P. Tristram Coffin's *Poems for a Son with Wings* and Oscar Williams' *That's All That Matters* represented the more easy. Alex Comfort's *The Song of Lazarus* had topical overtones. Norman Nicholson's *Five Rivers* was devotional. A curiosity was *A Stone, a Leaf, a Door*, passages from Thomas Wolfe's writings arranged in verse by John S. Barnes. Also noteworthy were: Jon Beck Shank's *Poems*; George Zabriskie's *Like the Root*; Caryll Houselander's *The Flowering Tree*; Ian Serrailler's *The Weaver Birds*; John Malcolm Brinnin's *No Arch, No Triumph*; Francis Meynell's *Seventeen Poems*; Robert Farren's *Rime, Gentlemen, Please*.

Among anthologies: *War and the Poet*, edited by Richard Eberhart and Selden Rodman, covering many centuries; *The War Poets*, edited by Oscar Williams; *Other Men's Flowers*, edited by Viscount Wavell; *What Cheer*, humorous, edited by David McCord.

BENFIELD PRESSEY.

LIVING COSTS AND STANDARDS. The average family found it more difficult to maintain customary living standards during the first few months of peace than at any time during the war. Incomes were reduced while living costs continued to rise and most goods remained as scarce as during wartime. Wage earners in industries producing durable goods—including munitions—suffered the greatest drop in weekly wages, more than fifteen percent between April, 1945, the last month of the two-front war, and September. Workers in non-durable goods industries and white collar workers in general had relatively little reduction in earnings but paychecks always had been smaller for these workers than for wage earners in heavy industries.

Most of the drop in incomes was the result of elimination of premium payment for overtime work, downgrading of jobs to accord with peacetime standards, and a transfer of workers from highly paid war industries to peacetime industries with lower pay scales.

Despite the high level of family incomes in the war years, a considerable number still received very small amounts, forcing them to draw on savings or go into debt to buy the basic essentials. A study, released by the Bureau of Labor Statistics late in 1945, indicated that even in 1944, when incomes were at an all-time peak, one-fifth of all city families and single persons had incomes of \$1,500 or less after taxes, and one-half had incomes of less than \$2,700. More than half of those families with incomes above \$3,000 achieved this level only because two or more persons in the family worked.

This study also indicated that the average family with an income of less than \$1,950 after taxes did not "break even" in 1944. Approximately one-fourth of all city families in 1944 had incomes below this amount. It should be emphasized that an income of \$1,950 after taxes left nothing for savings or life insurance payments, although the average family did buy war bonds, going into debt or drawing on savings to do so. The difficulty of achieving even this "break even" income is indicated by the fact that one person would have to work 50 weeks a year, 40 hours per week at \$1.03½ per hour to secure this income. Average hourly earnings in manufacturing in October, 1945 were \$0.99.

These incomes meant a fairly simple level of living for most families. The family which just broke even in 1944 earned \$2,070 before taxes,

paying \$119 in taxes to secure a net income of \$1,950. Typically such families spent an average of not more than 22 cents per meal per person. But even at this rate food took 38 percent of the family net income. Housing, including rent, light and refrigeration, took another 18 percent or \$359 (about \$30 per month). Expenditures for clothing took \$250, a somewhat higher percentage of total income than in prewar years, reflecting the sharp advance in clothing costs during the war years. Household operation and furnishings required \$140, and medical care \$105. The remaining income was spent on such things as transportation, personal care, recreation, and education.

Since living costs were slightly higher in 1945 than in 1944, the "break even" point in the latter year would be somewhat above \$1,950 after taxes, but no detailed figures are available.

Significant changes from prewar years in the pattern of spending were noticeable. Typically, food and clothing absorbed larger proportions of the total at any given income level in 1944 than in 1941, reflecting the substantial rise in prices for these goods. Because of effective rent controls, however, shelter costs did not equal these advances. The absence from the market of automobiles and durable household equipment was reflected in the much smaller amounts devoted to these goods in 1944 than in peacetime. Medical care took a larger portion of the total, particularly among low income families, with higher costs of medical care and possibly a greater need for care because of longer hours of work.

Even though the average family lived simply during the war years, it should be emphasized that many families were able to improve their level of living over prewar levels. Regular incomes and assurance of employment enabled many to occupy a home to themselves, to buy more and a wider variety of food, and to dress better than ever before. The improvement of living standards was especially marked for families in which the number of earners increased, where the chief earner found steady employment in place of unemployment, or was able to move from a low wage job to a higher. For such formerly low income families the war resulted in no more unfavorable economic consequences than moving to a different city or inability to find desired goods in stores, some of which they were financially able to buy for the first time.

The average wage earning family, while experiencing these common inconveniences, maintained its standard because of longer hours of work. This source of income made it possible for many families to pay taxes, buy war bonds and even to buy deteriorated goods or high-price lines without substantial inroads on their modest prewar standard of living. It is disappearing earlier, however, than these burdens on the family pocketbook. Those who suffered the most serious loss in living standards were those living on pensions or other forms of fixed income, and some of those families who lost a principal earner to the armed forces. Rationing and the unavailability of goods restricted the purchasers of the upper income third or so of the population. For the average family, however, only the durable goods were in short supply by prewar living standards. For example, the number of pairs of shoes allowed under rationing was greater than the normal prewar purchases of the moderate income family, although they were of inferior quality since the armed forces took all of the best leather. So, too, civilian per capita consumption of meat was greater in 1944 and 1945 (with rationing) than in the years of 1935-1939.

Of major importance, however, was the problem of maintaining quality, particularly for clothing and housefurnishings. The deterioration of quality—not measurable in official indexes—placed a serious burden on lower income families forced to increase their purchases of living essentials because of lessened durability of the merchandise they could buy. Equally important, and a major factor in the rise of living costs during 1944 and 1945, was the disappearance of the lower price lines of goods normally bought by working men's families. This forced "up-trading" was the principal cause of the rise of 18 percent in clothing costs between 1943 and 1945, and in the rise of 18 percent in costs of housefurnishings.

The end of hostilities in August brought relatively little change in the wartime living pattern of most families. Goods which had been scarce or unavailable continued scarce during the first months of peace. Housing was even shorter in December than in December 1944, low cost clothing of prewar quality was generally unobtainable, and coal was about as hard to get during late 1945 as during the previous winter. Supplies of food for civilians were generally larger, however, and petroleum fuels were in ample supply.

Retail prices of living essentials (as measured by the Consumers' Prices index of the Bureau of Labor Statistics) rose about 2 percent in 1945, approximately the same as in 1944, and less than in earlier years. Prices rose during the first seven months of the year to the highest levels since 1921, declined during the late summer with seasonally lower prices for fruits and vegetables, and rose again during the last quarter of the year. The gradual advance in prices was not materially affected by the end of the war.

Food prices at retail were only slightly higher in December 1945 than in December 1944. The housewife, however, no longer had to pay for goods with both money and ration coupons. Between August and December all foods were removed from ration lists except sugar, which was in poorer supply than during the war. Most other foods were generally available, although shoppers still had difficulty in finding bacon and hams, choice cuts of beef, and cooking fats and oils. Butter was generally obtainable although some stores continued informal rationing. Canned fruits occasionally were in short supply. Temporary shortages of other foods such as milk and eggs developed during the early winter but these usually were local and of short duration.

Clothing prices rose 5 per cent, the greatest increase for any of the major groups of living essentials. Most of the increases resulted from the continued disappearance of lower price lines, a problem which troubled government control agencies throughout the war. Significantly, such disappearance, which had been especially characteristic of women's and children's clothing, was most severe in men's clothing during 1945. Low priced cotton garments—shirts, shorts, pajamas—generally were unobtainable despite concerted efforts of governmental agencies to restore such goods to the market. Men's wool outer-clothing, which had been generally adequate during the war, virtually disappeared in many areas as needs of discharged servicemen were added to the already substantial civilian demand. Many, who for patriotic or other reasons had postponed purchases during the war, found it impossible to buy clothing which they needed, and the outlook was for supplies inadequate to the huge demand during much of 1946.

Women's and children's clothing continued in

short supply. Some garments of prewar quality at low prices, which were produced under government directive, reached retailers' shelves but the supply of these was far below demand and they were sold out almost as soon as they appeared.

Rents in large cities remained virtually unchanged in 1945, under tight government control, but the housing situation was more critical than at any time during the war and the real estate market was at inflationary levels. The removal of government restrictions on private building in October had little effect on new residential construction since materials remained scarce. The return of millions of discharged veterans, anxious to reestablish their homes, aggravated the condition in many areas. War production centers remained crowded, for laid off workers generally stayed in the areas rather than return to their old homes. In December, the President ordered the re-establishment of priorities on building materials to channel them into production of low and moderate priced homes, and asked the Congress for authority to control the price of houses, old and new. The Price Administrator indicated his intention to request authority to continue rent controls beyond the statutory limit of June 30, 1946, and governmental authorities estimated that the housing deficit would increase rather than decrease in 1946.

In accordance with their long term trend, rates for electricity and gas continued to decline fractionally during 1945, but prices for most other fuels advanced as in earlier war years. Retail coal prices rose to an all-time high as OPA allowed price increases in mid-year and again in December to cover higher production costs. Coal supplies remained tight through 1945 because strikes, production slowdowns and decreased labor supply reduced output; the coal made available by cutbacks in war production were generally not the kind preferred for domestic house heating and thus did little to relieve the situation. Petroleum fuels, on the other hand, were adequate by the end of the year. Gasoline was removed from rationing immediately after the cessation of hostilities and supplies were so plentiful that price wars occurred in some areas. Fuel oil was plentiful and those householders who had oil burning furnaces were in a more enviable position during the 1945-1946 winter than those who could use only coal. On the Eastern seaboard users of fuel oil and gasoline paid somewhat lower prices in December, 1945, than in December, 1944, following the removal of wartime price increases granted in 1942 to defray the higher cost of transporting petroleum fuels to the East by rail rather than tanker.

Prices of housefurnishings advanced 4 percent over the year, the largest increase for any groups except clothing. As in the case of clothing, most of the rise was caused by the disappearance of lower price lines. In housefurnishings this was especially important for sheets, curtains, and rugs. These goods still were available only in higher price ranges at the end of the year.

Durable consumer goods such as automobiles and household electrical equipment generally had not returned to the market by December. There were a few exceptions. Stoves, no longer rationed, were on the market in quantity, and electric heaters were available in most stores. Other equipment, however, such as refrigerators, washing machines, and vacuum cleaners, and smaller articles such as toasters, were in stores for display purposes only and few deliveries were being made to buyers. Automobiles were being produced at rates far below earlier estimates and only a few lucky pur-

chasers had actually received their cars. The cut-back in production of military equipment improved the supply of tires and allowed the ending of tire rationing at the end of the year.

Cost of miscellaneous goods and services advanced 1 percent during 1945. Costs of medical care continued to rise fractionally as the relatively small numbers of doctors and nurses released from military forces remained inadequate to restore prewar standards of service. Service industries such as laundries and dry cleaning establishments moved to restore prewar service with the end of governmental restrictions, but labor shortages in these low wage establishments continued to hamper service.

From the standpoint of the average consumer, 1945 differed little from immediately preceding years except in the promise which it held for a return of the peacetime way of life, and it appeared that many months would pass before this could be achieved.

GALEN B. PRICE.

LUTHERAN CHURCH, The. The Lutherans in America showed a steady growth in spite of wartime obstacles to parish work and mission activities. Membership totals for the United States and Canada were: baptized members 5,390,280, confirmed members 3,796,516; organized congregations 16,087, ordained ministers 13,953. Total receipts during 1944 were \$88,128,888, of which \$66,622,542 was for local expense and \$21,506,346 was for benevolences. A slight increase was recorded in the enrollment of Sunday and weekday schools, checking a downward trend begun in 1940.

Seventeen separate Lutheran bodies are included in the above total, some of them with their roots going back into the State churches of the mother countries in Europe. They have continued to experience a desire to work together in closer fellowship looking forward to the possibility of eventual unity. Eight of the bodies cooperating in the National Lutheran Council, comprising about two-thirds of the Lutherans of America, began a new chapter of cooperative activity under the Council's revised constitution, through which they have opened up larger channels of work in the fields of American missions, welfare, student work, and public relations. Work was continued in cooperation with the Missouri Synod to provide an adequate ministry for the men and women in the armed forces, furnishing abundant religious supplies to over 770 Lutheran chaplains throughout the world and maintaining 75 service centers in the United States, Canada, Alaska, the Hawaiian Islands, Europe, the Philippines, and China. This activity will continue during demobilization, with increased service to returning veterans. In addition, most of the 42 spiritual centers for war workers and their families in industrial areas were maintained at top capacity. An intensive program to provide a spiritual ministry to prisoners of war in this country was continued cooperatively by the National Lutheran Council and the Missouri Synod.

To finance the above activities and also to support the care of the Lutheran orphaned missions throughout the world and help rebuild the Lutheran Churches of Europe, the National Lutheran Council churches raised over \$2,200,000 on a budget of \$1,790,000. A goal of \$10,000,000 for the same purposes was set for the two years of 1946-47, the bulk of this fund to be used in Europe in behalf of the orphaned missions.

In the Synodical Conference, which makes up the remaining third of American Lutheranism, the

Missouri Synod alone collected over \$5,500,000 as a special Peace Thank Offering in 1945 to be used for reconstruction in devastated areas, an educational building program and home missions. The Lutheran Hour, a world-wide religious broadcast featuring Dr. Walter A. Maier, professor at Concordia Theological Seminary, St. Louis, reached a new high during 1945 in the number of broadcasting stations employed and nations served. Seven hundred and eighteen broadcasting stations under 23 different flags carried the Lutheran Hour resulting in mail from 59 different countries. One hundred and ninety-seven theological students entered the ministry of the Lutheran Church, Missouri Synod in 1945.

In March of 1945, a three-man Lutheran commission, representing the National Lutheran Council and the Missouri Synod, went overseas, visiting bishops of the Scandinavian countries and also the World Council of Churches headquarters in Geneva. Immediately upon the end of the war in Europe, Dr. S. C. Michelfelder was established in Geneva as a commissioner of the American Section of the Lutheran World Convention to supervise relief activities for American Lutherans and to coordinate them with similar activities carried on by the World Council of Churches. In November another joint five-man Lutheran commission, with special permission from President Truman, returned to the continent to investigate conditions in the Lutheran Church of Germany. National Lutheran Council delegates then called the first meeting of the Executive Committee of the Lutheran World Convention held in Copenhagen, Denmark, in December, 1945, the first to take place since May, 1939.

LUXEMBURG. A grand duchy in western Europe, under occupation by German armed forces from May 10, 1940, until liberated by Allied armed forces late in 1944. Area: 999 square miles. Population (Jan. 1, 1940, estimate): 301,000. Capital: Luxembourg. Agriculture was the occupation of 32 percent of the people. Oats and potatoes were the chief crops. Livestock (1939): 154,727 pigs, 107,417 cattle, 18,017 horses, 8,465 sheep, and 3,107 goats. The mining and metallurgical industries are the most important. In 1939 the output of pig-iron and ferro-alloys totaled 1,776,000 metric tons, steel ingots and castings 1,824,000 metric tons. In 1938 there were 35 blast furnaces and 7 steel works in operation. The budget for 1940 indicated revenue of 326,600,000 francs and expenditure of 369,000,000 francs. Public debt (Jan. 1, 1940): 1,528,000,000 francs.

Events, 1945. During the late winter of 1944-45 Luxembourg, after having had half its territory ravaged in the December offensive of the Wehrmacht, was liberated for the second time by American forces. On April 14 the Grand Duchess Charlotte returned to her country after five years of exile. She had established a Consultative Assembly in February. On October 21 the voters of the Duchy elected a new Chamber of Deputies. Of its 51 members, 25 represented the Christian-Socialist Party, 11 the Labor Party, 9 the Patriotic-Democratic Party and 5 the Communist Party, with one independent. The reconstituted cabinet was as follows:

Prime Minister—Pierre Dupong, Chr. Soc.
Minister of Foreign Affairs—Joseph Bech, Chr. Soc.
Minister of Labor—Pierre Krier, Labor
Minister of Education—Nicolas Margue, Chr. Soc.
Minister of Justice—Victor Bodson, Labor
Minister of Economic Affairs—Guill. Koesbruck, Chr. Soc.
Minister of the Interior—Eugene Schaus, Patr. Dem.
Minister of Social Welfare—Charles Marx, Comm.

Luxemborg participated in the San Francisco Conference and ratified the Charter August 10. The Government was preoccupied throughout the year with problems of reconstruction, relief, and repatriation of refugees.

FREDERICK L. SCHUMAN.

MACHINE BUILDING. The sudden termination of hostilities in both Germany and Japan found us almost as unprepared for peace as we had been for war. Munitions urgently needed to carry on the war became surplus over night and drastic readjustments had to be planned and executed as promptly as possible. While this was largely a managerial problem it also affected production by enabling it to plan for utilizing some of the methods developed for war work in peacetime production.

Among the machining methods which had been greatly improved as a result of war work are broaching, honing, and milling. Two striking examples of advanced broaching practice were found in the Rock Island arsenal and the Springfield Armory, both being manufacturing units of the Army Ordnance Department. These broaching operations included both the cutting of the rifling grooves in the rifle barrels and the manufacture of many parts used in the making of the new Garand, semi-automatic rifle. While guns of 155 mm bore had been rifled by broaching in some of the best gun plants in World War I, the grooving of the 30 and 50 caliber rifle barrels by the broaching method is believed to be new. Both of these plants broach their rifle barrels, but the method developed at Rock Island is unique and works well.

The Rock Island method uses a different type of broach and does not require a guiding cam to give the proper helix angle. It also grinds the teeth off of worn broaches and uses them in place of reamers to size the rifle barrel before broaching. Springfield has replaced the usual profile miller, so common in most gun shops, by broaching machines which are used on nearly every part that was formerly milled. This involved the designing and building of some very special fixtures for holding the work and is but one of the new methods which have been adapted by the arsenals.

Honing has also been used much more extensively than ever before. At the Rock Island Arsenal it has become standard practice for finishing both the cylinders and plungers for the recoil mechanism used on the various field guns. It has also been used extensively in making the hydraulic mechanisms or "oleos" of the landing gear of airplanes of different types. Its use has also increased in many peacetime operations, replacing the cylindrical grinder for many operations.

Higher speeds and feeds in milling practice are now found in many shops where machine equipment will permit. This is largely due to the extensive research that has been made as to possible speeds and feeds obtainable with the newer types of carbide cutting tools. This is true on both the harder steels and on the softer metals, such as aluminum and magnesium, which have come into use in the endeavor to reduce the weight of parts of airplane engines and other mechanisms. While much of this research has been done in the shops of makers of both milling machines and milling cutters, definite research programs were sponsored by the Office of Production Research and Development. These programs were in charge of a Mechanical Engineering Committee made up of members of the American Society of Mechanical Engineers. Careful studies were made at both the

California Institute of Technology and at the University of Michigan under the direction of this committee and Data Sheets giving the results of these tests were published and widely distributed to shops of various kinds where milling was part of their work on war products. The increased speeds and feeds resulting from the experience gained in this way had a direct influence on the quantity of work produced for the armed forces, which included many projects from airplanes to tanks.

The use of welded structures in the building of machinery is on the increase. While this is not new, as there are examples of broaching machine beds and even planers being welded previously, its use is growing and some of the late examples of frames for large hydraulic and other press units, are very striking. Increased use of welded bases has been retarded by the feeling on the part of many designers that a heavy mass of metal was necessary in most machine beds, to absorb vibrations due to operations being performed. It has required time for designers of welded bases to prove that, when the bases are properly designed there are no vibrations to be absorbed.

This trend toward welded structures has spurred the makers of both malleable iron and steel castings to improve their practice and to make new efforts to sell their products. The final decision will depend both on cost and also to some extent on the suitability of the welded metals for bearing surfaces. In the case of the planer previously mentioned it was necessary to attach cast-iron wearing surfaces to the welded structure. Some machine structures are built up by welding castings to the steel frame but it is usually better to attach the bearing surfaces by mechanical means and avoid the dangers of distortion.

Experience with the highly stressed parts of airplane engines, such as connecting rods, has led to the development of what is known as "shot peening" of the surface after machining. Fine pellets of steel are blown against the finished surface under considerable pressure, compressing the surface a few thousandths of an inch and adding to its resistance to fatigue stresses while in use. This peening replaces the high polish formerly considered necessary by some. In the Studebaker plant they follow the shot peening with a lacquer spray which protects the surface of the metal against the corrosive action of perspiration from the hands of workmen. This is an added protection, not only in the plant where the rods are made but also in the storage depots in various parts of the globe, and in the field. In the tropical countries this is even more important than in this country.

The large numbers of unskilled workers which it was necessary to utilize in the making of various war products naturally encouraged the designing of more automatic machinery than before and the combining of operations where possible. Both hydraulic and electrical controls for cutting tools by which they followed patterns or templates were used in making forging and other dies with semi-skilled workers. The most striking development of automatic control is the Man-Au-Trol developed by the Bullard Co. primarily for use on their vertical turret lathe. As at present used it can control 40 different settings of the tools without attention of the operator. It does not prevent the machine being used manually at a moment's notice and the same device is also being applied to the controls of other machine tools.

In addition to simplifying and speeding the operation of the machine it also prevents errors in setting the tools for any of the cuts needed. One application was the machining of the crankcase of a large radial engine where a single error would scrap the forging as well as all the work previously done. In the war effort this would mean great delay in addition to the cost. This is a phase of the automatic machine problem that is not always considered.

Utilizing experience gained on war work when it was necessary to drive machines to their limit, the builders of machine tools have, or soon will have, new types of machines as well as greatly improved construction in the older types. Some are offering to rebuild their own make of war-worn machines for use where obsolescence is not the main factor, as in contract and jobbing shops. It seems also quite probable that the success of having parts built in different shops may carry over into peace time products to a considerable extent.

New products such as surface plates of marble, granite and glass are likely to make a place for themselves. Glass gages, which were a war necessity, may be made commercially in spite of the controversy which their use aroused. It is also probable that some of the lower priced machine tools which did such good service during the war, may find a wider field than before. With lowered machining costs, due to new cutting tools and new methods, these machines may provide real competition to the better known machines.

FRED H. COLVIN.

MACY FOUNDATION. Established in 1930 by the late Mrs. Kate Macy Ladd in honor of her father, Josiah Macy, Jr., the Foundation reported total expenditures for the year ending Dec. 31, 1945, at \$406,746; total grants paid \$226,000. Drafts are not permitted upon the endowment, which has a ledger value of \$6,541,175. Emphasis is placed on special problems in medicine which require for their solution studies and efforts in correlated fields as well, such as biology and the social sciences. Approximately \$100,000 of expenditures for 1945 was used for the distribution of medical reprints to medical officers of our armed forces and our Allies. This war Reprint Service has been discontinued. President: Dr. Willard C. Rappleye. Medical Director and Executive Secretary: Dr. Frank Fremont-Smith. Headquarters: 565 Park Avenue, New York 21, N.Y.

MADAGASCAR. A large island, belonging to France, located off the southeastern coast of Africa. Including dependencies, it has an area of 241,094 square miles and a population (1936) of 3,797,936, of which 25,255 were French.

Government. The colony now comprises not only Madagascar but the formerly separate colonies of Diego-Suarez, the island of Nossi-Bé, the island of Ste. Marie, and the Comoro Islands. The latter are strategically located in the Mozambique Channel about halfway between Madagascar and the African mainland. The Governor-General is assisted by a Consultative Council of Administration and an Economic and Financial Delegation comprising a French section and a native section. Both the French and native sections consist almost entirely of elected delegates, who ordinarily meet once a year to discuss the budget and other economic and financial questions (see *Events* below). A large part of the lower civil and military offices are filled by natives.

Events, 1945. Early in the year the Governor-

General declared that Madagascar was prepared to send to France no less than 40,000 tons of coffee, 25,000 tons of rice and smaller amounts of other items sorely needed by the French consumer, if shipping could be obtained. Also early in the year, it was announced that reforms were to be enacted which would allow the natives greater participation in local administration.

In the spring a decree was signed which created a Representative Council. This measure constituted a long step forward, since the Economic and Financial Delegation could not concern itself with political problems and since in any case the Governor-General would overrule its recommendations. The new Council was to consist of sixty members: twenty elected by the French citizens in Madagascar, twenty natives elected by local bodies, and twenty appointed by the Governor-General (eight French and eight natives chosen to represent eight different economic centers, plus two French and two natives selected to represent the trade unions). These men were to serve a four-year term and were to be elected by a restricted franchise. The body was to be a deliberative one and its decisions were to be binding.

Population. A number of different peoples or tribes comprise the native population of Madagascar. The most intelligent and numerous are the Hova, who speak a language that is related to dialects of Malaya and Oceania, and which serves more or less as a *lingua franca* for much of the island. In addition to the various native peoples, there are communities of Indians, Chinese, and Arabs, many of whom are engaged in the retail trade.

Madagascar has for several decades been the object of intense Christian missionary activity, particularly by Protestants. There are now nearly 2,000 Catholic and about 3,500 Protestant churches, in addition to 75 mosques. Most of the Hova and the other tribes in the central districts have embraced Christianity, while the outlying tribes are still largely pagan. Education among the natives is also much further advanced than almost anywhere else in Africa. In 1939 there were 1,011 government schools with 126,947 pupils, and 706 private schools with 94,232 pupils. There are also higher institutions for advanced training in medicine, administration, agriculture, and the like.

Economy. Madagascar is one of the largest and most productive of the French colonial possessions. Soil and climatic conditions are favorable for the production of tropical and subtropical crops over wide areas. The principal crops, together with the area under cultivation in 1938, were: rice, 1,319,250 acres; manioc, 558,100 acres; maize, 216,162 acres; sweet potatoes, 296,400 acres; coffee, 230,080 acres; vanilla, 55,340 acres; and sugar cane, 43,401 acres. Forests are extensive and valuable. In 1936 there were 6,000,000 cattle in the colony. The beginnings of modern industry may be observed here and there. Graphite is the principal mineral product of the island, 14,400 tons being mined in 1938.

During the last prewar year (1938) Madagascar's imports were valued at 602,710,000 francs and her exports at 819,397,000 francs. France supplied three-fourths of the imports and took four-fifths of the exports. There is thus a considerable volume of shipping that calls at the island's ports, of which the most important is Tamatave. The total railway mileage exceeds 500 miles. Before the war Madagascar was connected with France by a weekly air service.

ROBERT GALE WOOLBERT.

MAGAZINES. Few sharp changes marked the re-conversion of the magazine industry from war to peacetime publishing. The product remained substantially unchanged, and to magazines which had been straining against paper restrictions and printing handicaps, the war's end did not mean unlimited output. Lack of skilled labor, and difficulties in the form of strikes, notably at the R. R. Donnelley Company's huge printing plant in Chicago, slowed production. In place of the Government's program of paper rationing, repealed in September, came natural rationing caused by continued shortages. While there was not sufficient paper to take care of all demands, enough was forthcoming to permit lifting subscription restrictions which were in effect during the war; and by the year's end, only a handful of magazines were refusing new subscriptions even for one-year periods.

Advertising. Advertising restrictions were being lifted, except in certain magazines like *Time* and *Newsweek*, so oversold that they still had a considerable backlog of unfilled space orders. The physical appearance of magazines gradually improved with better paper and larger page and type sizes being used at the close of the year.

Advertising revenue of magazines continued to gain in 1945, increased still further by the wide use of color advertisements. The total income from magazine advertising in 1945 exceeded \$300,000,000, showing an increase of some \$29,000,000 or almost 10 percent over 1944. An increase in advertising guarantees and rates was announced by a number of publications including *Saturday Evening Post*, *Time*, *Life*, *Fortune*, *Newsweek*, *Liberty* and others.

Circulations climbed to new highs, subject to production limitations.

Content. Editorially, there were the beginnings of perceptible changes to gear magazines to peacetime living. Magazines such as *Life*, which had devoted so much space to war features, were including more and more material of domestic, home-front appeal. In the last quarter of 1945 there was some "war fiction" published, but dozens of stories appeared dealing with the returned serviceman, his problems of readjustment, etc. In non-fiction more emphasis was placed on home building, health, general science, etc., and the transition from a life of war strain to fireside and neighborly pursuits.

Expansion and Investments. Financially, the magazine business had enjoyed spectacular success during the war years, and at the beginning of 1945 there were dozens of new magazines announced for publication, many of them getting under way even before all paper limitations were lifted. Publishers were planning to take advantage of the stepped-up reading habits of Americans—and new and more magazines in various fields were forthcoming. Also, elaborate plans were made for revitalizing established publications. Many large publishers spent a great deal of their pre-tax profits on research surveys to determine their markets and potential readers.

The successes in the field during the past few years have been apparent to more than those in the publishing fraternity. Perhaps for the first time the industry began to be looked upon as "big business" with large profits likely for the investor. Equitable Securities of Nashville, Tennessee, purchased in 1945 two influential southern magazines—*Holland's* and *Farm and Ranch*. This investment banking corporation paid \$450,000 for these two, giving it ownership of three publications, *The Southern Agriculturist* having been previously purchased.

Liberty was purchased by the Atlas Corporation, a Manhattan investment firm, for some \$2,000,000. This company also owns such profitable publications as *Silver Screen*, *Movie Show* and *Screenland*.

Marshall Field extended his publishing interests to the magazine field. In addition to his book and newspaper holdings, he purchased the *Southern Farmer*, a monthly with a circulation of some 300,000, through the firm, Cross Country Reports, of which he is part owner (with James P. Warburg). For editor and publisher of this new publishing acquisition, Mr. Field engaged Aubrey Williams, former National Youth Administration Director.

Beyond this, Marshall Field formed the Magazine Corporation of America, of which Norman Cousins, editor of the *Saturday Review of Literature* is editorial director, and J. R. Cominsky, vice-president of the *Saturday Review* is business manager. This group is engaged in research and planning for a new national mass-circulation weekly.

To insure an adequate paper supply for themselves, several publishers purchased paper mills. Time, Inc. bought the Bryant Paper Company and Maine Seaboard Paper Company. Curtis Publishing Company purchased the Book Mills of the New York and Pennsylvania Paper Company.

New Publications. There was hardly a field that was not covered by at least one new magazine, either announced or published during 1945. Many general magazines came upon the scene, and new trade periodicals were put out to meet the demand of those businesses which flourished during the war.

The phenomenal success of magazines appealing to teen-agers, notably *Seventeen*, which reached an estimated circulation of 800,000 in December, prompted other publishers to tap this lucrative field. Throughout the past year lineage reports show *Seventeen* in the top bracket of the listing for women's magazines. Beginning in November, another publication made a bid for the profitable junior market—*Junior Bazaar*. This is issued by the publishers of *Harper's Bazaar* and aims at being a "young New Yorker." A monthly selling for 35 cents, it competes with *Glamour*, *Charm*, *Mademoiselle*, and, to some extent, *Miss America*. Also bidding for this market is the *American Girl*, which revamped its format, added color pages and shortened its articles, making an appeal for the 13 to 17 group.

Aimed at the women's market are two new magazines, *Fascination*, published by the Avon Pocket-size Book Company, which began in December, issuing its January, 1946, issue. Also, the publishers of *Family Circle* brought out in October the sample issue of a new monthly women's service magazine, *Eve*. This will be distributed through the chain stores and will sell for five cents.

A field that is attracting several new publications is the veterans' market. While some old magazines such as *Pic* and *Argosy* are revamping their magazines and aiming at the returning GI group, there have also been a number of new ventures, with several others scheduled for 1946. *Amvets*, started by the American Veterans of World War II, has brought out a 16-page monthly tabloid.

Another is *Veteran Outlook*, from the Public Affairs Press. It aims to be a "clearing house of economic, social and legislative information for ex-servicemen." *Army and Navy Bulletin* is a new magazine for reservists and other non-regular officers.

Other magazines scheduled in this field are *Veterans News*, *Veteran Journal*, *Convoy America*,

New York Veterans Report, dealing with the problems of the ex-serviceman.

An ambitious publishing venture came in the form of *Ebony*, a life-size and style picture magazine for Negroes, with John H. Johnson, editor of *Negro Digest*, acting as editor.

But these are only a few of the host of publications that saw light for the first time in 1945. In April, AM, a daily trade news magazine, came out with a "rehearsal" issue. Scholastic Magazines brought out *Scholastic Debater* for high school and speech students. A new publication dealing with the problems of the girl in business, *Business Girl*, was launched. *Picture-Wise*, a picture story magazine, appeared. The publishers of *Magazine World*, trade journal for the magazine trade, announced a new publication designed to improve house organs—*Edit*. Others making their appearance were *Radio Maintenance*; *Railway Equipment*; *Gentlemen*; *Industrial Plastics*; *Sports Management*; *Housing Progress*; *Village Chatter*, covering topics of interest in Greenwich Village; *Folklore Quarterly*; *Mind Digest*; *Containers*; *Best Stories*; *Super Market Merchandising*; *Your Home*; *Power House*; *Mystery Book*; *Labor-Management Digest*; *South American Digest*, which is written in English and deals with South American life and peoples; *American Products*; *Televue*; *Two to Six*, brought out by the publisher of *Baby Talk*, covering editorially this small child group.

Published in Canada but distributed both in Canada and in this country is a non-profit magazine designed to promote international understanding—*This Month*. Both original and reprint material are included from U.S. and foreign publications.

Labor and Nation made its appearance. It deals with national and international life as they concern labor; public opinion as it bears on labor; reviews of labor literature.

To report latest developments to the industry, air travelers, air schools, sporting and aeronautical societies, *American Helicopter* appeared in December.

Out in November was *Commentary: A Jewish Review*, sponsored by the American Jewish Committee, which "aims to meet the need for a journal of significant thought and opinion on Jewish affairs." *Commentary* incorporates the *Contemporary Jewish Record*, issued by the Committee for the past eight years.

Foreign Editions. With the cessation of hostilities, magazines looked towards the potential foreign markets, serviced during the war and after by government-issued books and magazines. *Newsweek's* French edition became full-sized, becoming the first American periodical to publish a continental civilian magazine. *Omnibook* followed it closely with a special new edition in English for distribution all over Europe, and an Australian edition of *Omnibook* is announced for early in 1946. Time, Inc. set up a new company called Time-Life International to control the activities of *Time*, *Life* and *Fortune* outside the U.S. and Canada. The new division of *Time* is to convert the armed service editions from exclusive military readership to commercial readership all over the world. English editions of *Time* are printed in Sweden, Argentina, Brazil and Hawaii. These are the same editorially as in the U.S., being flown to 22 other countries. In keeping with the bid for the foreign market, in June, 1945, the *Reader's Digest* added another foreign language edition to its list, this in Finnish. This makes five foreign language editions of the *Digest*, the other four being in Spanish, Portuguese, Arabic and Swedish. The

combined circulation of these foreign language editions is over a million and a half.

As an outgrowth of the prosperity which the magazine industry enjoyed, many publications have expanded beyond the strict limits of magazine publishing. *Young America* set up a separate educational film company, producing 16 mm films, specifically designed for supplementary teaching tools. Publisher David A. Smart of *Esquire* and *Coronet* plans to make instructional sound color films for classroom use. Crowell-Collier formed its Editorial Extension to supplement the editorial policy of Crowell-Collier Magazines (*Collier's*, *Woman's Home Companion*, *The American*), through pamphlets, movies, etc., which will aim at local community action on problems of public interest.

During the past year, *Esquire*, *Look*, *Mademoiselle*, *Vogue*, experimented with television, and it is possible that magazines will be a source of material for future programs.

Another instance of this expansion is seen in the new line of 25-cent reprints called Bantam Books, the first of which were out late in 1945. One of the large owners of this new book company, which is a direct competitor of the highly successful Pocket Books, is the Curtis Publishing Company.

Revivals. With the war's end many suspended publications were resumed, or will soon resume publication. *International Digest*, which started as a quarterly in June, 1944, and was published irregularly from then until last fall, is now a monthly, with the first print order of a quarter of a million. Beyond the resumption of the publication of *International Digest* in this country, French and Spanish editions are in preparation, and a Scandinavian edition is due shortly.

Everybody's Digest, begun as a quarterly, becomes a monthly with the February, 1946, issue.

But many of the suspended magazines will probably never be revived. Fawcett Publications, sixth largest paper users in the country, dropped from 63 to 14 publications during the war. Rather than resume all these, they will probably concentrate on the current leaders. They have already changed *Life Story Magazine* to *Today's Woman*, beginning September, 1945. *Today's Woman* is now designed to fit the requirements of the young woman between the ages of 18 and 30. Another Fawcett publication, *True*, gradually became a "slick with a strictly masculine approach." Fawcett has also been concentrating on the promotion of their comic group, having added a number of monthly, bi-monthly and quarterly comics. And Fawcett's *True Confessions Magazine* made a sales record, becoming in the summer the largest-selling magazine on American newsstands. During the first six months an average of 1,959,405 copies of each issue were sold on the newsstands. *Startling Detective Magazine*, suspended in August, 1944, was resumed with the January, 1946, issue.

Yankee, which had been published intermittently during the past few years, resumed publication. Other resurrections were *Dare Devil Aces*, *Sport Novels*, *True Aviation*—and *Print* resumed in January.

Suspensions. There were also some suspensions. Many of these had purely wartime interest. Among them were *Yank*, *Flying Cadet*, *Tricolor*, *South Today*, *Aerend*, *American Prefaces*, *Fantasy*, *Woman's World*, *Air Pilot and Technician* and *Battle Birds*.

Government Rulings. The long-continued case of the Postmaster of the United States vs. *Esquire*, regarding the right of *Esquire* to a second-class

mailing privilege, entered a new phase in June 1945. The U. S. Court of Appeals reversed the lower court's findings that Postmaster General Frank C. Walker "had rightly deprived the publication of its second-class mailing privileges." Associate Justice Thurman Arnold left no doubt that he saw no basis for Walker's stand. This victory for *Esquire* was hailed as an affirmation of the freedom of the press. The case was reviewed by the U. S. Supreme Court, which upheld the decision of the U. S. Court of Appeals.

With the cut in the appropriation for the OWI, periodical activities by the government were somewhat curtailed. But a number of magazines met the demand from our Allies for information about the United States. Two such were started in France—*Voir*, a picture magazine with a circulation of some 520,000, and *Choix*, a digest monthly produced jointly by the U. S. and Britain. *Voir* was suspended in August, as all of these magazines were designed merely to fill the gap until French publishing activities are resumed. There are counterparts of them in other European countries. *America* and *America Illustrated* for Russia; *Kijk* for Holland-Belgium, and two new ones for distribution in Germany: *Heute*, a monthly picture magazine, and *Auswahl*, a digest publication.

Forecast. At the year's end there were a large number of new magazines in the offing, many of which, dated January, 1946, made their appearance late in 1945. Among these was *Picture-News*, which aims to enliven current events with comic-book appearance and format. It covers books and movies, science, and entertainment.

Four new juvenile magazines were announced for early 1946 by Parents Institute: *Polly Pigtales*, *Sport Stars*, *Calling All Boys*, and *Calling All Kids*. They will contain articles, stories, movie reviews, some comics and rotogravure sections, and they aim to be of better quality than the run-of-the-mill juveniles. Parents Institute is also resuming publication of *True Aviation*, *Picture Stories*, *Real Heroes*, *Funny Book*. All of these, plus *Calling All Girls* and *True Comics*, will be known as the Parents' Junior Quality Group.

Further elaborate announcements and advertising campaigns have been carried on for some large-scale ventures. One of the most noteworthy is *Science Illustrated*, bought by the McGraw-Hill Book Company and being entirely revamped so that only the name remains. It will be a monthly, selling for three dollars a year. An initial print order of 500,000 is planned, with a circulation guarantee for the first issue of 250,000.

Another announcement of importance was that of Curtis Publishing Company's new magazine, *Holiday*, to make its first appearance with March, 1946, out in February. Counting on a postwar travel boom, Curtis has been working on this magazine for some time. It is designed for the "man, woman and child who wants to go places and know what he'll find when he gets there." This 50-cent monthly will concentrate on the vacation and holiday market.

Aside from these large enterprises, there are a number of smaller ventures scheduled. Among these is *The Californian*, a national fashion consumer magazine also covering travel, screen and fiction. *Salute*, produced by former editors of *Yank* and *Stars and Stripes*, will be on the stands with a February issue.

Horizons, a new cultural and recreation magazine for the Midwest, will be launched in Chicago.

Early in the new year Fawcett planned *Best Detective Cases*, a slick rather than a pulp.

In April, *Travel and Camera*, published by U. S. Camera Publishing Corporation, will bow in, replacing *U. S. Camera Quarterly*, which was suspended during the war.

United States News Publishing Corporation will initiate some time during the first half of 1946 a new weekly newsmagazine, *World Report*. This is to be profusely illustrated, "devoted entirely to the reporting and explanation of the news and background of international affairs."

Competing with the *American News Trade Journal*, the publishers of *Magazine World* are bringing out *Newsdealer*, aimed at the dealers who distribute independently of the American News Company.

The first issue of *Farm Quarterly*, handsomely illustrated, for those who want to farm for profit, progressive farmers, county agents, and agricultural students, was to appear on March 1. It is published by the publishers of *Automotive Digest*, *Mintcam Photography*, *Writer's Digest*, *American Savings Journal*, and will sell for 50 cents. It will be sold both on subscription and on the newsstands within a 750-mile radius of Cincinnati.

Farrell Publishing Company will bring out a companion magazine to *The Woman* to be called *Woman's Digest*.

A new quarterly, *Baby Post*, is distributed free to customers of stores of the Associated Merchandise Corporation. It is edited by the editors of *My Baby*.

The Atom; *Bestsellers*, a monthly containing condensations of three or four books in each issue; *CQ*, a radio amateur's journal; *Smart*; *The Design for Living*; *College and University Business*; *Cosmetic and Drug Preview*; *Public Works News*, are among the dozens of periodicals in prospect.

In the experimental stage, Curtis Publishing Company has a picture magazine due late in 1947, rumors persist, with few details available, of a new opinion magazine of the quality type to be launched by Time, Inc.; and there are vague reports of experiments with *Magazine X* by Look Magazine, and a new venture by Crowell-Collier.

There has been some speculation among publishers as to the effect of this onslaught of new publications on newsstand sales, where there will be dozens of bidders, old and new, for the magazine reader's money. Some feel that the impetus given magazine reading during the war years is likely to continue the boom. On the other hand, findings of the American News Company survey in November, 1945, showed a slump, particularly in the sale of comics and pulps. In the areas most affected by the industrial strikes, the sales were poorest. The closing of various Army and Navy bases in the south Atlantic and west south central regions also caused a decline in sales in those regions. The only exception was in weeklies and class magazines, which actually increased in some of those sections.

A. S. BURACK.

MAGNESIUM. Production of primary magnesium in the United States, which had shot to 183,584 short tons in 1943, and declined to 157,100 in 1944, subsided to 33,500 in 1945, less than any year since 1941.

A frantic plant construction program early in the war left the industry with annual production capacity of 293,000 short tons, never fully utilized. Of this capacity, 263,000 was owned by the government, representing an investment of \$369,-446,164.

Of the 12 companies who owned, or managed

for the government, 16 plants during the peak of wartime demand, only Dow Chemical Co. was in commercial production at the end of 1945. Dow owns outright 18,000 short tons of annual production capacity at Midland, Mich., and Freeport, Tex. It holds a purchase option on adjoining government-owned facilities at Freeport with a 9,000 tons annual capacity and another government owned plant at Velasco, Tex., with 36,000 tons annual capacity. During the war the process of extracting magnesium raw materials from sea water was perfected to such an extent that Dow will concentrate its postwar production at the Freeport plant, on the Gulf of Mexico, built in 1940.

Permanente Metals Corp., owned by the Henry J. Kaiser interests, at the end of the year was engaged in experiments aimed at reducing production costs at its Los Altos, Calif., plant, located about 75 miles south of San Francisco. The plant, which uses the carbothermic reduction method, has a rated capacity of 12,000 tons a year.

Built to produce magnesium in a hurry, with the least possible use of critical materials, the government owned plants showed widely varying production costs. Lowest costs achieved by each of the various plants, exclusive of interest and depreciation, ranged, at those using the electrolytic process, from 11.51 cents per lb. at Velasco, Tex., to 57.26 cents per lb. at Lake Charles, La. Plants using the ferrosilicon process showed minimum costs of from 18.32 cents per lb. at Luckey, Ohio, to 55.05 cents per lb. at Dearborn, Mich. Magnesium metal sells for 20.5 cents per lb.

Aircraft and incendiary bomb manufacture used the bulk of magnesium produced during the war, with relatively smaller amounts for tracer and incendiary ammunition, alloying with aluminum, and export. Estimates of annual postwar consumption quoted by the Surplus Property Administration range from 25,750 short tons to 32,250 short tons, with the aircraft industry still the principal consumer. Other civilian uses of the metal, whose principal selling points are its light weight and ease of machining, are seen in passenger automobiles, trucks and busses, portable tools, reciprocating parts of machinery, furniture, and other uses where weight is a factor.

The Surplus Property Administration recommended on December 7 that six of the government plants be retained for magnesium production during periods of national emergency. Providing, with the privately owned plants, a national annual capacity of 127,000 tons, these plants are located at Freeport and Velasco, Tex.; Spokane, Wash.; Canaan, Conn.; and Painesville and Luckey, Ohio. The remaining seven government owned plants, the SPA urged, should be sold or leased for other industrial purposes. It appeared that several of these would be acquired by the electro-chemical industry, which, like magnesium production, depends on sources of cheap power.

World magnesium production capacity was estimated at the end of 1944 to total from 394,200 to 419,200 short tons annually: United States, 293,000; Germany, 35,000-55,000; United Kingdom, 30,000; Japan, 15,000-16,500; Russia, 5,500; Italy, 5,000-5,500; Canada, 5,400; France, 3,300; and other countries, 2,000-5,000.

CHARLES T. POST.

MANCHUKUO. A former empire in northeastern Asia, established under Japanese protection Mar. 1, 1932; occupied by Allied armed forces following the surrender of Japan in 1945. It comprised the Chinese provinces of Fengtien, Kirin, and Heilung-

kiang in Manchuria, and Jehol and the six northern counties of Chahar in Inner Mongolia. Capital, Hsinking.

Area and Population. Including the South Manchuria Railway Zone under direct Japanese jurisdiction but excluding Kwantung (q.v.), the area of Manchukuo is estimated by Japanese sources at 503,013 square miles. The population at the census of October, 1940, was 43,234,000 (23,920,000 males, 19,314,000 females). As of Jan. 1, 1940, there were estimated to be 37,581,833 Chinese and Mongols (Mongols numbered about 1,000,000), 1,162,127 Koreans, 642,356 Japanese, and 67,710 of other nationalities. Estimated populations of the chief towns in 1939 were: Mukden, 834,703; Harbin, 473,422; Hsinking, 395,855; Antung, 214,972; Kirin, 135,000; Newchwang, 168,931.

Production, Trade, etc. See preceding YEAR BOOKS for statistics to 1940.

Government. Under the Constitution of Mar. 1, 1934, as amended July 1, 1937, Manchukuo was a monarchy in which the Emperor exercised both executive and legislative powers, the latter being subject to the approval of the Legislative Council, an advisory body appointed by the Emperor. There was a Privy Council, a State Council, and a General Affairs Board. (See under *Events*.)

Events, 1945. The Chinese territory of Manchuria together with the territories of Inner- and Outer-Mongolia, which lie directly west of Manchuria, constitutes an empire comparable in climate, agricultural and mineral resources to the section of the United States stretching from the Great Lakes westward through the Dakotas to Montana and southward to Nebraska.

It is the only section of Chinese territory where large scale farming and stock raising is possible.

Together these territories have a total area of 2,378,013 square miles or about nine times as much as Texas. Aside from Russian Siberia and Korea, Manchuria is nearer to the United States than any other section of Continental Asia.

Manchuria has long been known as the "cockpit of Asia" due to the complicated politics of the territory and the number of international conflicts which have been fought on Manchurian territory.

Racially the native inhabitants of Manchuria, the Manchus, are closely akin to the Mongols. Both the Mongols and the Manchus have conquered China, the Mongols in the 13th century and the Manchus in the 17th century. However, both conquerors were absorbed into the more highly cultured and fecund Chinese population. Also, being nomadic, neither the Manchus nor the Mongols were able to withstand the tides of Chinese immigrant farmers and merchants which swept into their countries from the densely populated areas to the south. Chinese migration into Manchuria and Inner-Mongolia, prior to the Japanese invasion, exceeded a million a year. Most of the Chinese came from the densely populated provinces of Shantung, Hopei and Honan. Of Manchuria's 35,000,000 odd population, the overwhelming majority are of Chinese blood.

International Conflict. China's first treaty with a foreign state, Russia, was signed at the Siberian town of Nerchinsk, a short distance west of the Manchurian border, in the 17th century. The treaty constituted China's first official recognition of Imperial Russia's expansion into the Far East. The treaty marked the beginning of recorded relations between China and Russia which have generally, but not always, been peaceful. In the Chinese Ming Dynasty (1368 to 1643 A.D.) Manchuria em-

braced the northern part of Korea, the present Russian Maritime Province and other territories of Siberia east of Lake Baikal, including Sakhalin Island. In three treaties signed with Russia in 1689, 1727 and 1858, usually following armed conflicts, China lost most of her Siberian territories north of the Amur and east of Lake Baikal to Imperial Russia. In 1860, by the Treaty of Peking, China recognized the Amur-Ussuri Rivers as the border between Manchuria and Russian Siberia. In these territorial readjustments China surrendered to Czarist Russia a land area practically as large as present Manchuria.

High Point of Czarist Expansion. The high point of Czarist expansion into this section of Northeastern Asia was in the years between 1896 and 1903, which embraced the period of the so-called "Boxer Rebellion" in North China when all of the Powers sent troops into the Peking area. Russia took advantage of the situation to improve her strategic position by the construction of railways and ports which provided access to the waters of the Pacific, thus making Russia an Asiatic-Pacific Power as well as a European Power. In 1896 Russia obtained from China a concession to build a railway across north Manchuria connecting the Lake Baikal district with Vladivostok. The railway was known as the Chinese Eastern Railway. In 1897 China granted to the Czar a lease on the Liaotung Peninsula of South Manchuria and the right to build a naval base at Port Arthur at the tip of the Peninsula on the warm waters of the Yellow Sea. In 1898 China granted Russia the right to build a railway directly across Manchuria from north to south, connecting the Russian Siberian lines with Port Arthur.

Between 1900 and 1903 Russia sent large forces into southern and eastern Manchuria ostensibly to protect her railway rights and port concessions, but her expansionist activities in Manchuria precipitated war with Japan which resulted in Russia's defeat. Russia was forced in the resulting peace treaty which was signed at Portsmouth, N. H., in September, 1905, to surrender to Japan Port Arthur and adjacent territorial and dock interests and the railway which the Russians had built from Harbin in North Manchuria to the tip of the Liaotung Peninsula, as well as the so-called Kwantung Leased Area and the then undeveloped port of Dairen. In the Treaty of Portsmouth (N. H.) Russia declared she had no territorial designs in Manchuria which were prejudicial to the sovereignty of China.

Russia Renounced All Rights. In 1917, following the Bolshevik Revolution, Soviet Russia renounced all czarist "rights" in Manchuria and on July 25, 1919, declared that all mining, forestry and other concessions secured by the czarist regime by force would be returned to China and that all treaties would be revised "on a basis of equality," including renunciation of Russian extraterritorial rights. The only Russian property over which the Soviet Union maintained control was the Chinese Eastern Railway crossing north Manchuria, which the Soviets ultimately were forced to sell to the Japanese at a sacrifice, following the Japanese intervention in Manchuria in September, 1931. China protested against the sale on the grounds that the line crossed Chinese territories and China legally owned a half interest in the property.

Japan Expands into Manchuria. Japan's acquisition of Russian properties in South Manchuria in 1905 was followed by a period of intense imperialist expansion in Manchuria. The Russian railway was converted to standard gage and equipped in accordance with American railway standards. Dairen

was developed into a modern port and the territory between Dairen and Mukden and including northern Korea was developed into a modern industrial base second only to that of Japan proper. Within this area were the Fushun Colliery, largest open-cut coal mine in the world, the large Anshan Iron and Steel Works and numerous industrial plants including textile mills, chemical plants and various munition plants and war industries.

Puppet State of Manchukuo. In 1932 the Japanese Kwantung Army defied the world and, despite protests by the United States and Great Britain and other countries, set up the puppet state of Manchukuo, placing on the throne the Manchu "Emperor" Henry Pu-Yi, popularly known as the "Boy Emperor" who had been deposed by the Chinese Republicans at Peking in 1912. His new title was "Emperor Kangteh" of Manchukuo. Soviet paratroopers, dropped at the Manchukuo capital Hsinking on Aug. 22, captured and interned Emperor Kangteh "in a safe place."

The high point of Japanese aggression in Manchuria was reached in September, 1931, when Japanese Armies belonging to the so-called Kwantung or Manchurian branch of the Imperial Forces, seized Mukden, the capital of Manchuria. The seizure took place at night without prior notice.

China Depended on Geneva. While Chinese forces put up some resistance, particularly in North Manchuria, China referred the case to the League of Nations at Geneva which, after prolonged debate, supported China's position. More than fifty nations represented there condemned Japan and ordered the territory restored to China. Japan refused to recognize the League's action and proceeded to occupy and fortify all of Manchuria, including most of Inner, or Southern Mongolia. Strategic railways were built chiefly leading to points on the Russian Siberian and Mongolian borders. The railways of northern Korea were connected with those of Eastern Manchuria, almost encircling the Soviet Far Eastern port of Vladivostok. Indications pointed toward a further Japanese invasion of Siberia and Outer Mongolia, but after two armed clashes, one near Vladivostok and the other on the Mongolian front, the Japanese apparently decided to forego their aggressive designs on Russia and shortly afterward entered into a Non-Aggression Pact with the Soviet Union in which Russia recognized Japan's position in Manchuria and Japan recognized Russia's position in Outer Mongolia.

Japan's invasion in 1931 which involved the scrapping of all post World War I treaties, including the arms limitation and other agreements of the Washington Conference, actually marked the beginning of World War II, for Japan's action was shortly followed by Mussolini's invasion of Abyssinia and Hitler's violation of Austria, Poland, and Czechoslovakia.

Russia Returns to the Far East. The latest chapter in the checkered history of Manchuria dates from Russia's entrance into the War in the Pacific. The Soviet declaration of war against Japan (dated, Moscow, Aug. 8, 1945) was as follows:

1. After the defeat and capitulation of Hitlerite Germany Japan was the only power continuing the war.
2. The demand of the three powers—United States, Britain and China—of July 26 for the unconditional surrender of the Japanese forces was declined by Japan. Thus the proposal of the Japanese Government to the Soviet Union concerning mediation in the Far East loses its significance.
3. In view of the Japanese refusal to surrender,

the Allies approached the Soviet Government with a proposal to join the war against the Japanese aggressors and thus shorten the time for ending the war, reduce the number of victims, and aid in the general restoration of peace.

4. True to its duty as an ally, the Soviet Government accepted the proposal of the Allies and joined the declaration of the Allied Powers.
5. The Soviet Government believes that such a policy is the only means that can bring closer the ending of the war, liberate people from further sacrifices and sufferings, and give the Japanese a chance to avoid the danger and destruction which Germany lived through after its refusal to accept unconditional surrender.
6. In view of the above the Soviet Government declares that beginning tomorrow, that is August 9, 1945, the Soviet Union considers itself in a state of war with Japan.

The Soviet Far Eastern Army began hostilities against Japan at 12:10 A.M. Thursday (Aug. 9), launching a sudden attack along the Siberian-Manchurian border just an hour after Moscow's declaration of war became effective.

Russians Attack at Seven Points. According to a report on August 14, less than a week following Russia's declaration of war, the Soviet forces invaded Japanese occupied territory in Manchuria at seven points: (1) the western end of the Chinese-Eastern Railway; (2) from Outer Mongolia; (3) west of Vladivostok; (4) north of Vladivostok in the vicinity of Hulin; (5) in the vicinity of Khabarovsk near the mouth of the Sungari River; (6) southern end of Sakhalin; (7) in the Kurile Islands. In north Manchuria the Soviet objective, aside from seizing the Chinese-Eastern Railway was the capture of the old Russian metropolis of Harbin. On the eastern Manchurian front the objective was the terrain to the west of Vladivostok, the purpose being to occupy the Japanese railway lines and fortified points to the west of the Russian port. Later the Russians invaded northern Korea. The Soviet commanders on the various fronts included Marshal Alexander M. Vasilevsky, western and Mongolian front, directed at Harbin; eastern front, westward of Vladivostok, Marshal Kirill A. Meretskoff; valleys of the Sungari and Ussuri Rivers, Gen. Maxim Purkayeff; west bank of the Ussuri, Marshal Meretskoff; western Manchuria, Marshal Rodion Y. Malinovsky, Commander of the Transbaikalian Army, partly made up of horsemen. In addition to the land attacks it was reported that the Soviet Far Eastern Fleet, based at Vladivostok had attacked the Japanese ports of Yuki and Rashin on the upper northeastern coast of Korea, opposite Vladivostok, using Marines. The Russian Fleet was commanded by Admiral Ivan Yumasheff. The troops landed on the Kurile Islands were air-borne.

According to reports from Washington and London the Soviet Union had from 1,000,000 to 1,500,000 troops available in the Far East, a considerable portion being based in Outer-Mongolia.

It was thought that the Russian-Mongolian Army in Outer-Mongolia was ready to drive in a southeasterly direction through Kalgan directly on Peking.

Russia Long Prepared. An article in the New York Times by C. L. Sulzberger, dated at Geneva on Aug. 9, stated that Soviet preparations for invading Manchuria had been proceeding quietly for several months. Mr. Sulzberger, who had been in Moscow for several months, said that military missions from Outer Mongolia had been holding conferences in Moscow. Also that trips of the American Ambassador, Brig. Gen. Patrick J. Hurley,

between Chungking and Moscow had been concerned with diplomatic phases of the expected Russian war declaration against Japan and possible repercussions in China resulting from the Soviet action.

According to Lt. Gen. Albert C. Wedemeyer, Commander of American forces in China, Japanese withdrawal of troops from central and south China was partly due to Japan's anxiety about a possible Russian invasion of Manchuria and north China.

The Moscow radio reported on August 10 that the Republic of Outer Mongolia had declared war on Japan and was prepared to send ten Red Army-trained tank, infantry, and cavalry divisions into the struggle in western Manchuria.

Russians Used Mongolian Bases. A Moscow report on Aug. 15 claimed that a "two-pronged drive," presumably from Outer Mongolia, had carried the Russian Army to within 125 miles of China's ancient capital, Peking. The authority for the report was General Alexei Antonov, Chief of the Red Army General Staff. He said that this particular Russian drive was spearheaded by planes and tanks and was slashing across southern Chahar province of Inner-Mongolia, already reaching a point only twenty-five miles from Kalgan on the old Caravan Route running from Peking to Mongolia and Sinkiang. It was thought by some that this Russian drive into Inner Mongolia had some connection with the later advance into the region by Chinese Communist troops which later occupied Kalgan.

On Aug. 18 the southern wing of Marshal Rodion Y. Malinovsky's Transbaikalian Army occupied Chifeng, capital of Jehol Province directly north of Peking and only 150 miles from the sea. This represented a 120 mile drive directly eastward from the Outer Mongolian border.

Mukden stated, Aug. 16, that all Japanese troops in Manchuria had ceased fighting, but that the Russian forces were continuing their advance on all fronts despite Emperor Hirohito's capitulation proclamation. The Russian general staff regarded Hirohito's capitulation as "merely a general declaration of unconditional surrender," and until the Japanese issued an order to the Army to surrender its arms "Russia cannot consider it a complete capitulation."

The Russian Commander-in-Chief, Marshal Alexander M. Vasilevsky, on Aug. 18, sent an order to the Japanese Chief Commander in Manchuria, Gen. Otozo Yamada, to dispatch his Chief-of-Staff, General Hata to Harbin immediately so that he could board a Soviet plane to be transported to Khabarovsk, the Soviet Military Headquarters, to discuss the surrender terms. Marshal Vasilevsky stated that orders had been issued to the Soviet armies to cease military operations.

Japanese Had Million Men. Moscow estimated the Japanese Kwantung Army in Manchuria and other Japanese forces in Korea and Sakhalin Island to number 1,000,000 men.

Reports from Moscow, and Soviet Army Headquarters in Harbin, Changchun (Hsinking) and Mukden, Aug. 20, indicated the Russians had almost entirely occupied Japan's stolen Manchurian Empire of 503,013 square miles and 39,000,000 population.

An Allied war prison camp at the town of Sian, 100 miles north of Mukden, was liberated by the Russians, Aug. 24. The camp contained 1,698 prisoners, including twenty-eight American and other Allied officers. Among them were Lt. Gen. Jonathan M. Wainwright, Maj. Gen. George M. Parker of the U. S. Army, and Lt. Gen. A. E. Percival, Commander of British forces in Malaya.

By Aug. 27 the Russians had taken 438,000 Japanese prisoners; two days later the bag had been increased to 586,000 officers and men, and the Japanese were surrendering at the rate of 25,650 a day. The surrendered included 111 Generals, with booty of 687 aircraft, 347 tanks, 957 guns of various caliber, 711 mortars, 3,355 machine guns, more than 200,000 rifles, 108 radio stations, 1,789 trucks, 118 tractors and other vehicles, 9,708 horses, 727 ammunition dumps and large quantities of food. Among the generals was Otozo Yamada, Commander-in-Chief of the Japanese forces and twelve members of his staff.

Russians Occupy Port Arthur. The Russians announced they had occupied the great Czarist military and naval base of Port Arthur and had ordered all Japanese to leave the port which Russia lost to Japan in 1905. Over the Port Arthur radio they declared they were engaged in a "systematic cleansing of Port Arthur's Japanese scum"; and they proclaimed their intention of developing Port Arthur into "one of the mightiest naval bases in the Pacific."

Will Fortify Kuriles. Russian sky-borne troops which occupied the Kurile Islands took off from Kamchatka peninsula. The first landing was made on Shimushu Island close to the Japanese naval base at Paramushiro. Paramushiro was the frequent target of American Aleutian-based planes, only 750 miles away. The U.S.S.R. planned to develop new harbors on the Kamchatka peninsula opposite Alaska converting the 20 odd islands of the former Japanese Kurile group "into a veritable bastion forming a screen of steel for protecting Russian Pacific waters," and maintaining permanent garrisons on the Kuriles "in order to assure Russia free access to the Pacific."

"We Waited Forty Years"—Stalin. In an address commemorating the Russian victory—East and West—Stalin declared that Russia had a special account to settle with Japan. Japanese aggression against Russia went back to 1904, when the Japanese "took advantage of the weakness of the Czarist Government and treacherously attacked our country without warning." Russia suffered defeat. Japan seized Sakhalin and strengthened her hold on the Kuriles "thus locking all outlets to the ocean. It was plain Japan set herself the aim of wresting from Russia her entire Far East. In 1918, after the establishment of the Soviet system, Japan took advantage of the hostile attitude of Britain, France and the United States toward the Soviet Union and again attacked our country and for four years ravaged our people." Stalin then referred to the Japanese attacks on Siberian outposts in 1938—at Lake Khasan (near Vladivostok) and at Khalkhingol on the Mongolian border—which were beaten off. "For forty years we have waited for this day," he declared. "Our Soviet people did not spare their strength or labor for the sake of victory . . . I congratulate you, my dear compatriots, on the successful termination of the war and the coming of peace—glory to our Far Eastern troops and the Pacific Fleet."

Authorized at Yalta. Secretary of State James F. Byrnes stated on Sept. 4 that Russian occupation of the south half of Sakhalin and the Kuriles, and the old Czarist interest in Manchuria, had been authorized at the conference of the Big Three—Roosevelt, Churchill and Stalin—at Yalta in the Crimea. He said he did not think the United States would raise any objection.

The New York *Herald-Tribune* called attention to the fact that during the war with Japan the Kurile Islands "took on a malign significance for

Americans as they provided a stepping-stone to the Aleutians."

American Supplies Helped Russia. Russian participation in the war against Japan was greatly facilitated by American supplies sent to Siberia by plane from Alaska and across the Pacific from Portland to Vladivostok. The United States began turning over Liberty ships to Russia at the rate of 20 a month in the summer of 1944. They flew the Russian flag and carried war materials from Portland and other West Coast ports to Vladivostok. Each ship was valued at \$1,500,000. Value of materials shipped to Siberia amounted to \$1,700,000,000, of which \$900,000,000 represented airplanes, tanks, jeeps, ammunition and other war materials as well as large quantities of railway and construction materials.

Chinese-Russian Treaty of Alliance. Dr. T. V. Soong, Chinese Premier and Foreign Minister went to Moscow immediately following the San Francisco Conference, for the purpose of reaching an understanding with Russia concerning the relations of the two countries in Manchuria and Mongolia and various other issues. The fact that Dr. Soong held frequent conferences with the American Ambassador in Moscow indicated American interest in the subjects under discussion. According to Washington, early in August, the following subjects were on the agenda: (1) Formation of a coalition government in China to give adequate representation to the Chinese Communists. (2) Recognition of Outer Mongolia by China as an independent state, and recognition of Russian special interest in the area. (3) Passage over and possible return to Russia of the Chinese Eastern and South Manchuria railroads. (4) The right to reestablish a naval base at Port Arthur, the least concession being provision for ample dock facilities for commerce routed to the ice-free port. (5) Soviet concurrence in the Cairo Declaration assuring the independence of Korea. (6) China's agreement to Japan's return to Soviet Russia of the lower half of Sakhalin Island. (7) China's support for annexation by Russia of the Japanese Kurile Islands, or at least a sufficient number to give adequate guaranty of protection to Vladivostok and the mainland. (8) Discussion of Russia's and China's position with respect to the future status of Indo-China. (9) A guarantee by Russia of a "hands-off" policy toward Manchuria, with assurance of having a friendly neighbor. (10) Russian non-interference in the internal affairs of China and promise of fullest cooperation for the industrial, commercial, agricultural and cultural development of postwar China.

Treaty Published August 14. The text of the Russian-Chinese Treaty of Friendship was made public in Moscow on Aug. 14, the day the Japanese accepted the surrender terms of the Potsdam Ultimatum. The essential parts of the treaty consisted of five agreements concerning the disposition of the Chinese-Eastern, South Manchurian and other Manchurian railways, the naval base at Port Arthur, the adjacent port of Dairen, Manchuria as a whole, and the status of the former Chinese territory of Mongolia. The five supplementary agreements were as follows:

1. The former Japanese-owned South Manchurian Railway and the former Russia-Chinese owned Chinese Eastern Railway are to be amalgamated into the Chinese Chang-Chun Railway System under joint Chinese-Russian ownership and control as a purely commercial enterprise for a period of thirty years, following which they are to revert to China. The Chinese Government is to have charge of the railway police and of the main-

tenance of normal order and the guarding of railway premises and properties. The railways are to be subject to Chinese taxes. The Manchuria railways may not be used to transport Soviet troops, "except in a period of war against Japan." The Soviet Government has the right to transport on the railway "by transit without customs administration, military equipment in sealed carriages, which will be guarded by Chinese railway police but not escorted by Russian troops."

China will set up a Chinese Chang-Chun Railway Company and an administration of five Chinese and five Russians will be constituted. The chairman will be a Chinese member, the deputy chairman a Russian. In decisions concerning administration the chairman's vote counts as two. The administration will appoint a managing director and deputy director, the former Russian, the latter Chinese. Lower officials, including station masters, are to be equally divided among Russian and Chinese.

2. Port Arthur, the former Russian base at the tip of the Laotung Peninsula, which was taken over by Japan, is to become a joint Chinese-Russian base for a period of thirty years.

3. The Japanese port of Dairen, chief commercial port of Manchuria which was developed by the Japanese, is to be a free port with a Russian harbor master. All goods in transit to and from Russia are to be exempt from customs duties at Dairen.

4. With these exceptions Russia is to respect China's full sovereignty throughout Manchuria and agrees to withdraw all troops from that territory within three months after Japan's formal surrender. (The date of withdrawal agreed upon was February 1, 1946, according to a Moscow report.)

5. China recognizes the independence of Outer Mongolia, subject to a plebiscite. Russia agrees to respect the independence of Outer Mongolia. (A later announcement from Moscow stated the Mongols had voted "unanimously" in favor of independence.) The Russians also agreed to avoid interference in the internal affairs of Sinkiang, or Chinese Turkestan.

The life of the Chinese-Russian Alliance is to be thirty years and Russia is to render moral and military assistance to the National Government of China. The treaty was signed by Molotov on behalf of Russia and by Dr. Wang Shih-Chih, Foreign Minister, on behalf of the Chinese National Government. The treaties were ratified by both governments on August 24.

Of particular significance was the clause in the treaty in which Russia states its willingness to render China moral support and military assistance and other material resources, "this support and assistance to be given fully to the National Government as the Central Government of China." This declaration aroused widespread interest since there had been rumors the Soviet Government would support the Chinese Communist regime at Yenan.

The new treaty quickly received a severe test in Manchuria where Communist troops succeeded—with Japanese assistance—in gaining control of certain regions prior to the arrival of the Chinese Nationalist Army. (See reference to General Marshall and Kuomintang-Communist Controversy in the China section.)

Soviet Comeback. Belief was general that Russian invasion of Manchuria and the new 30-year treaty marked the return of Russia to the Far East, with renewed force and vigor far exceeding that which carried the forces of the Czar into these fertile regions a half century ago. That Japan realized the

significance of the Russian come-back was evidenced by Japan's seizure of Manchuria in 1931 as a supreme Japanese effort to forestall the Russian move.

It was thought that China's action in granting the Russians a naval base at Port Arthur would prevent China from pressing Great Britain to relinquish her base at Hong Kong.

JOHN B. POWELL.

MANDATED TERRITORIES. Following is a list of territories conquered from the German and Turkish empires during World War I and mandated by the League of Nations to various of the Allied Powers under the terms of the Treaty of Versailles.

<i>Mandated Territory</i>	<i>Mandatory Power</i>	<i>Former Owner</i>
Cameroons, British . . .	Great Britain	Germany
Cameroon, French . . .	France	Germany
Japanese Pacific Islands	Japan	Germany
Nauru	British Empire	Germany
New Guinea, Territory of	Australia	Germany
Palestine	Great Britain	Turkey
Ruanda-Urundi	Belgium	Germany
Samoa, Western	New Zealand	Germany
South-West Africa . . .	Union of South Africa	Germany
Tanganyika Territory . .	Great Britain	Germany
Togo, French	France	Germany
Togoland	Great Britain	Germany

Iraq, a territory mandated to Great Britain, became an independent state by treaty with the mandatory power on June 30, 1930. Iraq was admitted to membership in the League of Nations and the mandate terminated on Oct. 4, 1932. Syria and Lebanon were proclaimed independent republics on Sept. 16 and Nov. 26, 1941, respectively, by Gen. Georges Catroux, the Free French High Commissioner. On Dec. 27, 1943, an agreement was signed between representatives of the French National Committee of Liberation and of Syria and Lebanon, by which all powers and capacities exercised hitherto by France under mandate were transformed as from Jan. 1, 1944, to the Syrian and Lebanese governments. As a result of the defeat of Japan in World War II, the Japanese Pacific Islands passed to the control of the Allied Powers.

MARCUS. A small island in the Pacific (24° N. and 153° 30' E.), 1,185 miles southeast of Tokyo; occupied by the Japanese in 1899; under Allied control following the surrender of Japan in 1945.

MARITIME COMMISSION, U.S. The U.S. Maritime Commission, established by the Merchant Marine Act of 1936, is charged with the creation, development, and maintenance of an American Merchant Marine, adequate to serve as an auxiliary to the armed services in times of emergency; to carry all the nation's domestic water-borne commerce, and a substantial portion of its foreign trade.

A long range program to construct ships for replacement of obsolescent and over-age vessels was initiated in 1937-38, envisioning the building of 500 ships within ten years. At the same time a comprehensive system of training seamen was established, and other measures taken to insure the regulation and satisfactory operation of the American Merchant Marine under guidance of the Act of 1936.

An upward revision of building schedules was made in 1939 when an increasing burden was thrown on the United States merchant fleet by the outbreak and spread of war in Europe. Extension of aid to the nations aligned against the Axis in

1940 and the greater commitments planned under lend-lease led to the planning of an emergency ship construction program, put into operation in the spring of 1941. The first Liberty ships—the emergency-built vessels that came from the yards in so prolific a number in 1942 and 1943—were delivered the same month that Pearl Harbor was attacked.

A directive to the Commission from the President early in 1942 set the amount of shipping to be built that year at eight million deadweight tons and double that amount in 1943. The enormous productivity of the shipyards in the emergency program raised the amount of tonnage constructed under Commission direction in 1942 to more than the goal that had been set. As the emergency program made further advances in 1943, the year's total reached more than 19 million tons. In the first two years of wartime ship construction in the United States there were built 2,642 vessels. Their aggregate carrying capacity of 27,328,358 deadweight tons replaced all the shipping losses suffered by the United Nations.

At the beginning of 1944 the Commission announced that the emergency program would be curtailed during the year and that construction of faster cargo vessels and of special types for use of the armed services would be given emphasis. Production in 1944 was 1786 ships aggregating 16,299,985 deadweight tons. Though this was about one-sixth less than the record made in 1943, it includes a number of large vessels built for or converted to military use, showing comparatively little deadweight tonnage. In light displacement (the amount of water a ship displaces when unloaded), the tonnage built in 1944 exceeds the 1943 figure.

During the first 11 months of 1945, 1,060 ships of 10,383,000 deadweight tons were delivered. This period saw the completion of the Liberty and Victory ship programs as well as of the T2 type tankers.

War Shipping Administration. The WSA was created by an Executive Order of the President in February, 1942. It was given strategic control, for duration of the war, over all ocean-going vessels belonging to the United States except those under jurisdiction of the armed services. The training functions of the Maritime Commission were transferred to WSA. The U.S. Maritime Service for the training of seamen and their upgrading, and the Merchant Marine Cadet Corps for the training of young men directly as ships' officers were expanded to proportions by which the demands for ships' personnel have continuously been met. The Recruitment and Manning Organization supplements the efforts of owners, operators, and maritime unions in manning ships by seeking out experienced seamen ashore and inducing them to return to sea, and by taking whatever measures are necessary to prevent sailing delays for lack of crews.

Ships under control of WSA moved three-quarters of the 62 million long tons of export cargo from the United States in 1943. This rate of movement was about 20 per cent greater in 1944.

In the first six months of 1945, 48,225,000 long tons of cargo were exported on WSA controlled vessels. Of this, 11,850,000 tons were bulk liquid cargo, the rest military and dry cargo. On November 1, there were 4,442 merchant ships of 46,839,000 deadweight tons under WSA control.

In conjunction with the British Ministry of War Transport, the War Shipping Administration controls, from a strategic standpoint, the pool formed by coalition of all the shipping services of the United Nations.

United Maritime Authority: The United Maritime Authority was established in November 1944 to coordinate efforts of the United Nations in meeting shipping problems from the time of the defeat of Germany until six months after the cessation of hostilities with Japan. Participating members are the United States, United Kingdom, Netherlands, Norway and France. Associate members include Belgium, Canada, Greece, Poland, Australia, Brazil, Chile, Denmark, India, New Zealand, Sweden, and the Union of South Africa.

Meeting in October, the UMA decided to maintain control over commercial ship operation until six months after September 2, date set for suspension of hostilities. Delegates also agreed upon several steps to be taken in the interim period to simplify the operation of UMA control.

EMORY S. LAND.

MARKLE FOUNDATION, John and Mary R. Established in 1927 by John Markle. Limits its major activities to grants to institutions in support of special proj-

ects in medical research. Appropriations made in 1944 amounted to \$520,084, while grants paid and operating expenditures were \$505,974. There were in progress during the year 135 separate projects receiving aid. The year-end market value of the principal account was \$17,226,085. President, Thomas W. Lamont; Vice-President, George Whitney; Treasurer, Vernon Munroe; Secretary, Florence E. Quick; Assistant Treasurer and Assistant Secretary, Irene R. Power. Offices: 14 Wall Street, New York 5, N. Y.

MARRIAGE STATISTICS. The Census Bureau says it was due to "better economic conditions and . . . wartime psychology"—but, whatever the cause, 1942 was the marryingest year in the history of the United States: 1,758,000 marriages, being 13.1 out of every 1,000 of the population. The previous year was only a little below that figure with a rate of 12.6, and the following years scaled down to a 10.9 rate in 1944; in 1945 the trend was again up, reaching 1,600,000. That meant a five-year surplus

* Information furnished by the Women's Bureau, U.S. Department of Labor.

above normal peacetime weddings of nearly a million and a half.

This repeats, only more intensely, the experience during World War I, when the number rose sharply from 1915 to 1917, then declined as men were shipped overseas; but this time the rate has stayed above normal instead of falling below as in 1918.

The permanency of most wartime marriages, whose prime attributes were speed and emotional impulse, faces serious jeopardy. By the beginning of 1946 more than half of the war-wed servicemen had returned to civilian life and one out of every four of these 800,000 men were almost immediately entangled in divorce proceedings. In the Feb. 3, 1946, issue of *The New York Times Magazine*, Jere Daniel stresses six basic reasons that form the groundwork for these divorces and separations; the haste with which ill-acquainted couples wed; separations forced upon them by the war; disillusion which accompanied return; economic ills which beset them during reconversion; adultery, another handmaiden of war; and the foreign mesalliances contracted by soldiers overseas. The present plight of war marriages gives rise to the prediction that two out of three war marriages will end in separation or divorce by 1950.

During 1945, 10.8 per cent more marriage licenses were issued in cities of 100,000 inhabitants or more than during 1944, according to the Bureau of the Census statistics.

During the seven years for which this information is available, the 1945 total of 568,713 marriage permits granted in these major urban areas was exceeded only once—in 1942, the national peak year for marriages. Although the 1945 total was 4.4 per cent below that for 1942 (594,908), it was 39.1 per cent higher than the estimated total for 1939 (408,989), the last year during which the United States, broadly speaking, was operating under peacetime conditions.

Two sharp marriage peaks in 1945 reflected the changing war scene. The rises during the first half of 1945 were preceded by a decline of 0.9 per cent—with a total of 258,917—from the January to June total for 1944. This minor decrease was a strong contrast to the issuance of marriage licenses in the last half of 1945 when 309,796 licenses were issued in the major cities, indicating an increase of 23.0 per cent over the July to December total for the previous year. During this part of 1945, July, November and December reached new peaks. The July rise, in large part, may have been caused by marriages during redeployment furloughs; the November and December peaks, by marriages of discharged veterans.

More than half of the men who ever marry do so before the age of 25 years, and women before the age of 22 years, according to an analysis of the Bureau of the Census. The analysis is based on the median age at the time of the first marriage for those men and women who ever marry during the course of their lives. For men who ever marry, the estimated median age at first marriage is 24.3 years; that is, one-half marry at a younger age than 24.3 years, and one-half at an older age. The corresponding figure for women is 21.6 years.

The median age at first marriage has changed by only a small amount over a long period of time. Apart from biological factors, the ages at which people marry are largely determined by social customs, which change rather slowly within a given population group or area. During any one year, of course, the number of men and women who marry is affected by economic conditions and

by the psychological temper of the people at that time, and for a short while these factors may have some effect also on age at marriage. Over long periods, however, such variations have tended to balance out.

MEDIAN AGE AT FIRST MARRIAGE FOR ALL MEN AND WOMEN WHO EVER MARRY, FOR THE UNITED STATES, COMPUTED FROM THE CENSUSES OF 1890 TO 1940

(Medians for females in 1940 based on data from Sample C for all women ever married, 45 to 64 years old. Medians for females prior to 1940 and for males in all census years estimated from complete count of male and female population by age and marital status)

Census Year	Male	Female
1940	24.3	21.6
1930	24.3	21.3
1920	24.6	21.2
1910	25.1	21.6
1900	25.9	21.9
1890	26.1	22.0

Statistics computed by life table methods show that eleven out of every twelve persons reaching the age of 15 in the United States eventually marry. According to these figures the year of age in which the largest percentage of single women are married is 23 and for single men, 26 or 27. As indicated in the accompanying table, 21.3 percent of the single women attaining the age 23 are married within a year, and likewise 17.3 per cent of the single men attaining the age 26. From these high points the percentages married in the current year decline rather slowly with increasing age, dropping below 8 per cent for women at age 32 and for men at age 36.

CHANCES OF MARRIAGE FOR SINGLE PERSONS, AS COMPUTED BY LIFE TABLE METHODS

(Based on data for period 1920-39)

Age	Percent Who Marry Within Year*		Percent Who Ever Marry ^b		Percent of Population Single, 1940

* Percent of persons single at beginning of year of age who marry during the year. This figure indicates the chance of marriage within one year from attaining the specified age.

^b Percent of persons single at beginning of year of age who marry in that year and all later years. This figure indicates the total chance of marriage for persons who have attained the specified age.

^c Percent single in age group 40-44, 45-49, etc.: data for single years not available.

MARTINIQUE. A French island colony in the West Indies, between the British islands of Dominica and St. Lucia. Area, 385 square miles. Population (Jan. 1, 1940), 260,000, mostly Negro and mulatto, with about 5,000 whites. Fort-de-France, the capital, had 52,051 inhabitants; Le Lamentin, 16,303. Sugar, cacao, bananas, pineapples, and rum are the main products. Trade (1938; in U.S. dollars): imports \$6,756,000; exports \$8,918,000. Budget (1937): 101,100,000 francs. The colony is administered by a Governor, aided by a privy council and a general council. All citizens without regard to color enjoy the same civil and political rights as Frenchmen in the mother country. The general council, which votes the budget, and the municipal councils are elected by universal suffrage. In addition, the colony was represented in the French Parliament by 1 senator and 2 deputies. Governor: Georges Parisot (appointed Dec. 5, 1944).

MATERIAL COORDINATING COMMITTEE—United States and Canada. A Committee created May 14, 1941, to make possible the free exchange of vital information between responsible officials of Canada and the United States relating to their supplies of strategic raw materials. The United States members are William L. Batt, Edward Browning, Jr., and George H. Emery. The Canadian members are G. C. Bateman and H. J. Symington.

MEDICINE AND SURGERY. This year saw the death of Dr. Walter B. Cannon, one of America's most renowned physiologists, who died October 1, 1945, at his summer home in Franklin, New Hampshire. He had been the George Higginson professor and head of the Department of Physiology since 1906, at the Harvard Medical School, retiring in 1940 with the title of Emeritus. His 34 years in this important professorship afforded him an opportunity for tremendous influence on the lives of many living practitioners of medicine. In his book on "The Wisdom of the Body," Doctor Cannon said that his first research in the pursuit of medicine was a study of the phenomenon of swallowing. Thus began a long career of physiologic investigation. For his distinguished achievements he was awarded the Baly Medal of the Royal College of Physicians in 1931, and the gold medal of the National Institute of Social Sciences in 1934. In 1941 he was the first recipient of the Friedenwald Medal of the American Gastro-Enterological Association, in recognition of his pioneer utilization of the X-rays in gastro-enterology and his important contributions to the mechanics of digestion; to the elucidation of the sensations of hunger and thirst; and to the development of the science and practice of gastro-enterology. Doctor Cannon always maintained an interest in medical education. Early in his career he suggested the "case" method of teaching medicine. Much of his work dealt with organic conditions as affected by emotions, and his investigations resulted in established practices for controlling these conditions. His prolific contributions to scientific literature reflect his diversified interests. Among his publications are articles describing movements of the stomach and intestines; internal secretions; effects of emotional excitement; surgical shock; organic stabilization; chemical mediation of nerve impulses; medical education, and the defense of medical research. The books written by Doctor Cannon have been exceptional. The list includes *A Laboratory Course in Physiology*, 1910; *The Mechanical Factors of Digestion*; 1911; *Bodily Changes in Pain, Hunger, Fear, and Rage*, 1915; *Traumatic Shock*, 1928; *The Wisdom of the Body*,

1932; *Digestion and Health*, 1936; *Autonomic Neuro-Effector Systems*, with Arturo Rosenblueth in 1937. Just recently his autobiography, called *The Way of an Investigator* was published. As stated in his obituary in the *Journal of the American Medical Association* for October 1945, he reflects the geniality, the philosophy, and the inspiration that was a basic factor in a career that achieved true greatness.

Progress in Virus Diseases. Definite progress in the treatment of virus diseases has not been as gratifying as one could hope. Several developments, however, are worthy of mention and indicate a trend in efforts being made toward solution of the problems. These are notably, first, the development of a vaccine for typhus fever, and second, the vaccine for influenza; finally, dengue vaccine. These new materials employ the technique of the chick-yolk-sac membrane method of culture. This inspired idea of using the egg as a vaccine production plant is in the true tradition-shattering style of modern research. It has become a fairly standard procedure within half a decade. In 1938 Dr. Herald R. Cox, then in the U.S. Public Health Service, but now a member of the research staff of one of the large drug houses, discovered a new method for growing micro-organisms of the family Rickettsia. He found that the yolk-sac membrane of live chick embryos undergoing incubation was an ideal culture medium for the virus of typhus and many other infecting agents. He originally employed this method to prepare a vaccine against Rocky Mountain spotted fever. A similarity in certain aspects of Rocky Mountain spotted fever to the Rickettsia of typhus, led Doctor Cox and his co-workers to adapt the method for the large scale production of typhus vaccine virus. In developing the method improvements were suggested by the National Institute of Health. At present, extraction of a culture with an organic solvent, replaces the older method of using physiological salt solution for that purpose. Thus, within the foreseeable future, it seems likely that one of the great plague diseases of all times will be brought under control. Typhus has blotted the pages of civilization's history for a score of centuries.

By a similar method, influenza vaccine has been prepared and a considerable experience has already been gathered among the members of the armed forces. This year has seen the release of an influenza virus vaccine, a development of wartime research and now available in the last months of 1945 for civilian use. The vaccine is effective in providing protection against types A and B influenza viruses, which are the most prevalent causes of recent epidemics. Influenza virus A is the name given to the filtrable virus discovered in 1938 by Smith, Andrews, and Laidlaw. Various strains of this virus have been identified as the causes of a number of influenza epidemics. Influenza virus B was described by Francis in 1940. Ten-day incubated eggs are used for production of influenza virus, which is converted into purified and concentrated vaccine, with aseptic precautions. A puncture hole is made through the shell of the egg, the influenza seed of viruses types A and B are injected into the embryonic fluid. Eggs are then reincubated for two more days; during the 48 hours large amounts of virus develop in the allantoic fluid of the embryonated egg. The virus is separated from the fluid, first by absorption on red blood cells and cold agglutination, and then other technical means for standardization are employed. Influenza virus characteristically exerts a pathogenic effect on the epithelium of the respira-

tory system. It is thought that the infection with the type A virus is somewhat more abrupt in onset, with fever and severe constitutional symptoms, while type B virus frequently has a more gradual onset with less intensive symptoms and shorter duration. No satisfactory chemo-therapeutic antibiotic treatment of the virus infection is available, and care of the patient consists for the most part of measures that are symptomatic, supportive, or preventive of bacterial complications.

During the wide-spread epidemic of influenza in November and December of 1943, a military commission, as reported in the *Journal of the American Medical Association* for 1944, investigated the influence of the concentrated inactivated vaccine on the incidence of clinical influenza on an army specialized training program unit, comprising about 12,500 men. Subcutaneous injections of mixed influenza virus vaccine, types A and B, was found to exert a protective effect. Among 6,200 unvaccinated controls the attack rate of influenza was 7.11 percent while at the same time the attack rate among 6,263 vaccinated subjects was 2.22 percent. These favorable results led to the production of this vaccine on a large scale for the use of the armed forces. The protective effect of vaccine containing inactivated influenza viruses types A and B against induced infections with type A virus was studied by Mann and reported in the *Journal of Clinical Investigation* for July, 1945. On standard exposure to influenza virus type A no reports of serious reactions to the vaccine have appeared. The results of its use in a large percentage of the population is awaited with considerable interest.

Another study of interest comes from the Harvard University press, in the form of a book by F. M. Burnet, *Virus as Organism—Evolutionary and Ecological Aspects of Some Human Virus Diseases*. In this book a discussion of the origin of the virus is interestingly presented. In its restricted sense, the term virus is applied to agents of disease, which, so far as known, do not multiply in any medium other than living cells of a susceptible host, and which pass through standard filters holding back bacteria. Burnet in his book has reviewed the speculation concerning the origin of viruses, and their relations to other forms of life. One hypothesis assumed that viruses may be fragments from cells of high forms, foot-loose genes, which have found ways of surviving by passage from host to host. Definite evidence of any such process has not been advanced. A dominant view of the origin of viruses is that they are degraded descendants of larger pathogenic microbes, as suggested by the range of visible forms between bacteria and certain viruses. Rickettsias and psittacosis viruses resemble bacteria in several ways, but their requirements for growth are those of viruses. In the case of the smallest viruses the resemblance to bacteria is not so striking. Other possible sources may be fungi, protozoa, and spirochetes. This latest view of the origin of viruses assumes that the loss of power of chemical synthesis on the part of the descendant units was associated with adaptation to an intracellular environment in which synthetic power is not required for indefinite survival in successive hosts. This implies that viruses with, as well as without, vectors like other living beings have intricate evolutionary histories. Burnet writes "We can state dogmatically that there is no evidence whatever that any virus, whether its host be animal, plant, or bacterium arises *de novo*. Every virus particle, like any other organism derives by genetic descent from some similar particle, and in its turn possesses the power to produce under appropriate

conditions, replicas of itself." As stated in a recent editorial in the *Journal of the American Medical Association*, medical practice in public health work, and present investigation are firmly based on the principle that virus diseases breed as true to type as other infectious diseases.

Finally, the report concerning the development of dengue vaccine by Davis and his associates of the Army Epidemiological Board is also of interest, thanks to the heroic cooperation of inmates of the New Jersey State Prison, who volunteered without offer of reward to serve as subjects for numerous inoculations. In 1931 Binger attempted without success to propagate the dengue virus by intracerebral inoculations in young mice, using effective human serum as the inoculum. In the New Jersey prison experiments, this technique was varied by inoculating young mice intracerebrally, with an ultra-centrifuged concentrate of such serum: this concentrate containing approximately 10,000,000 minimum human effective doses per cubic centimeter. On the first attempt only 10 to 20 percent of the inoculated Swiss mice exhibited clinical signs of effectiveness, and then only after an incubation period of nearly four weeks. Serial passage was carried out through various generations of mice until by the ninth passage fatalities were still increased to 90 percent and by the fifteenth passage to 100 percent. It was observed that all human volunteers inoculated with a practically avirulent tenth mouse passage dengue virus, acquired a solid immunity against subsequent inoculations with fully virulent virus or to bites of mosquitoes from a batch demonstrated infective to non-immune human volunteers. Volunteers immunized with a combined dengue and yellow fever vaccine also developed neutralizing antibodies with yellow fever virus. From these preliminary successes Sabin concludes that mouse adapted dengue virus can be used safely and effectively as a prophylactic vaccine against dengue fever.

Penicillin. Penicillin continues to hold the number one spot in the medical scene. It is the wonder substance, and medical literature is filled with articles dealing with its varied applications and uses. Especially gratifying has been the price reduction since the release of the drug for civilian use on March 15, 1945—as a result of sales competition and increased production. Where at one time \$2.40 was the charge for 100,000 Oxford units, the rate for this quantity is now as low as sixty cents wholesale. The release of oral penicillin within the latter months of 1945 was an event of considerable moment, and not anticipated by many. Since the parenteral form is more economical, both in price, as well as in effectiveness, the delay of the release of the oral form was inevitable. It is now available, however, in many forms, such as tablets for oral use; troches for purposes of chewing, and various types of ointments for topical application. There seems little doubt but that penicillin given orally is quite effective. For a time it was thought that when given by mouth, to avoid inactivation, it must escape the destructive influences of gastric acidity. Studies by Finland and his co-workers would seem to indicate that penicillin given by mouth before a meal, in doses of 90,000 units gave comparable blood levels to those obtained from 15,000 to 20,000 units given intramuscularly. Whereas, with the doses given after meals, the blood levels were very irregular and unpredictable. Also achlorhydric individuals, as compared with normal ones, had much more sustained serum levels from penicillin taken before meals and higher as well as better sustained levels from the postprandial doses. Re-

ports of its effectiveness in many diseases are now at hand.

Gamma Globulin. An editorial in the June 9, 1945, issue of the *Journal of the American Medical Association* calls attention to an important fraction of blood hitherto unappreciated. This recognition grew out of the work produced by the increased demand for blood and blood substitutes to combat battle wounds and shock. At first, whole blood, because of its instability and type characteristics, did not seem to meet the requirements necessary for most efficient military application. Dried plasma was evolved, a purified concentrated solution of the albumin fraction of plasma being developed by Cohn of Harvard and his co-workers. Blood plasma was fractionated in several purified components, by physico-chemical means. Plasma proteins, which are a normal constituent of blood, consist of two albumins and three globulins—Alpha, Beta, and Gamma. In addition to fractions contributing to blood coagulation and blood typing, the albumins are the proteins which are responsible for the maintenance of plasma volume, and thus are important in the treatment of shock, hypoproteinemia and edema. Of the globulins, the gamma fraction is concerned with the phenomenon of immunity, for in this fraction of normal and convalescent plasma are found the substances which give high anti-body titer.

The albumins are formed in the liver, but until recently the origin of the globulins remained uncertain. Dougherty, Chase, and White in a recent report in the *Proceedings of the Society for Experimental Biology and Medicine*, have discovered that anti-bodies are found in the lymphocytes of the blood, and believe that the lymphoid tissue is the site of anti-body formation, as was pointed out in the 1944 review. Many attempts have been made to separate the anti-body portion of the plasma from the gamma globulins, but all have proved unsuccessful. Kass, reporting in *Science*, for March 30, 1945, has shown that the antibodies are specific modifications of the gamma globulin; that these occur in the lymphocytes, with the antigens serving as the stimulus for the modification of the gamma globulin. Thus it appears that the gamma globulin is formed in the lymphoid tissue. Further studies have led White and Dougherty to feel that the pituitary-adrenal mechanism is the normal means of controlling the release of serum globulin from the reticulo-endothelial cells. As a result of the foregoing observation, the origin of the plasma proteins has now been further elucidated. The albumins are known to be formed in the liver; various degrees of liver damage cause a reduction of the plasma albumin. The globulins are now believed to originate in the lymphoid tissue and it is believed the gamma globulin may there be modified to give rise to the various anti-bodies. The role of gamma globulin in medical practice promises to be increasingly important; depending on the isolation and production of purified preparations.

Indeed, reports have already appeared on the use of gamma globulin in the prevention of certain types of disease, notably of infectious hepatitis, an epidemic type of hepatitis, stated to be one of the most important diseases of the present war. Stokes and Neese, in the January 20, 1945, issue of the *Journal of the American Medical Association*, report on the use of the preparation of gamma globulin, which was prepared by the Harvard Plasma Fractionation Laboratory, in the prevention of infectious hepatitis to exposed persons. Owing to the lack of knowledge concerning the etiologic agent and its mode of transmission of this disease, ade-

quate methods of prevention and control have not as yet been developed. Their data, however, suggest that gamma globulin from large pools of adult human serum may be effective in the control of certain epidemics of this disease. They call attention to the fact that parenteral injections of hemologous blood products have occasionally been followed by hepatitis. These blood products have usually been derived from single individuals, or in the case of pools, from relatively small numbers of adults. The frequency with which small pools contain a "hepatitis producing" agent, suggests that such an agent might be expected in large pools with even greater frequency. Yet, several thousand injections of gamma globulin used for the prevention and attenuation of measles prepared from large pools of adult plasma have not been followed by hepatitis. It has been shown that the absence of the hepatitis following the use of gamma globulin is not necessarily explained by the inactivation of the causative agents by the process of fractionation of plasma. The neutralization of the hepatitis producing agent by anti-bodies of gamma globulin would offer, however, a possible explanation of the apparent absence of hepatitis following the injection of gamma globulin. Because the evidence thus far available suggests that the virus agent responsible for epidemics in infectious hepatitis is present in the blood during the pre-icteric and early icteric phases of the disease, it seems reasonable to postulate that such neutralizing anti-bodies in gamma globulin might possibly be effective in aborting or attenuating this disease, if administered during the incubation or pre-icteric phase. These observations led to the use of gamma globulin in an extensive epidemic occurring in a summer camp for boys and girls. The results which are statistically significant indicate that gamma globulin is capable of preventing or attenuating hepatitis when administered to exposed persons during the incubation period. This effect is comparable to that observed with the use of gamma globulin in measles. Although the data suggest that the best results are obtained when the globulin is injected early in the incubation period, it seems possible that, as in measles, it may also be of therapeutic value if given early in the pre-icteric state of hepatitis. The results obtained in this epidemic were sufficiently encouraging to warrant further trials of gamma globulin. A subsequent report by Havens and Paul, in the Sept. 22, 1945, issue of the *Journal*, further confirms the effectiveness of gamma globulin. Ninety-seven children were given the globulin and the subsequent case rate of hepatitis with jaundice was compared with that in 155 children who were left as uninoculated controls. The case rate for jaundice in the controls was about ten times that noted among the inoculated. And again, Gillis, Stokes, and others in an article in the Aug. 11, 1945, issue of the *Journal* report their experiences in an outbreak occurring in a bombardment group based in the Mediterranean theater of operations, and in various regiments of the ground forces of the same theater. The results of a few field studies support the findings of Stokes and Neese, that gamma globulin is a potent agent in the prevention of such hepatitis, and suggest that globulin confers a period of passive immunity of at least six to eight weeks. These reports are indeed encouraging and the future development in the application of this new agent in the treatment of other diseases should be awaited with great interest.

Curare. One of the newest drugs to be added to the anesthesiologist's armamentarium is curare. The

drug has been known to science since 1595 when it is mentioned in a description of Sir Walter Raleigh's voyage up the Orinoco. In 1938, Richard C. Gill, an American who had lived for years in the upper Amazonian jungles of Ecuador, wrote of the mysticism surrounding the "flying death" as curare is called in that region. Prof. A. R. McIntyre of the University of Nebraska made the first extensive pharmacologic study of the drug with the idea of its clinical application. In cooperation with the E. R. Squibb and Sons Laboratories, a purified product was made in which its toxic side effects were removed. The resultant commercial product was given the name "Intocostrin" and has 20 mgm. of the drug to each cubic centimeter. The plant from which the drug is now extracted is the *Chondrodendron tomentosum*, having a selective action affecting first the muscles of the throat and neck, then the skeletal muscles of the extremities, chest and abdomen, and the diaphragm last or not at all.

The first test of Intocostrin on human subjects was made by Professor A. E. Bennett on the University of Nebraska who used it to soften the convulsive manifestations of shock therapy in psychiatric patients. Its application to the field of anesthesia is first recorded by Dr. Harold R. Griffith of Montreal, Canada, at the suggestion of Dr. T. H. Wright of New York. Dr. Griffith, working at the Homeopathic Hospital at Montreal, started his work in January of 1942. Considerable work has been done, in both experimental and clinical fields, by Dr. S. C. Cullen at the State University of Iowa Hospitals and Laboratories, and he has reported recently 1,000 successful administrations.

Although the drug demonstrates no parenchymal tissue damage and is self-limiting and short-acting, both Griffith and Cullen urge its use only by those who are well trained in the field of anesthesia.

Carcinoma of the Mid-thoracic Esophagus. Carcinoma of the esophagus has long been the most serious form of concern involving the gastro-intestinal tract, since cure by x-ray or radium treatment is almost never accomplished. For all practical purposes, the only hope lies in extirpation of the growth and of any regional lymph nodes involved by the disease. Although Dr. Torek of New York, in 1913, reported a successful cure of carcinoma of the middle portion of the esophagus accomplished by operative excision, until the last few years, successful cases have been relatively few. In the past decade, however, the technical problems involved in intrathoracic operations have become much more clearly understood, and during the past five years, cancers arising in the lower third of the esophagus have in many instances been removed successfully. Tumors lying in this region, that is in the lower end of the esophagus, may be widely excised and the continuity of the gastro-intestinal tract restored by anastomosis of the proximal esophageal segment to the stomach. Until quite recently, however, it has been considered impossible to remove tumors lying in the middle third of the esophagus and still safely unite the short upper end of the esophagus with the stomach. During the past year two workers have shown that this can safely be done. In 1944, Garlock of New York reported the successful reestablishment of esophagogastric continuity following a resection of the esophagus for carcinoma of the middle third. This year, R. H. Sweet of the Massachusetts General Hospital in Boston reported his experience with 20 such operations.

Garlock and Sweet were able to anastomose the short proximal esophageal segment to the stomach

by a maneuver which permitted them to draw the stomach into the thorax. This was accomplished by dividing many of the abdominal attachments of the stomach and a goodly portion of its blood supply. The anastomosis is carried out either below or above the arch of the aorta depending upon how high in the esophagus the tumor lies. Of Sweet's twenty cases, in twelve anastomosis was performed above the aortic arch, and in eight below. In the entire series, there were six deaths, a mortality rate of thirty percent, which in anastomosis is remarkably low.

Since carcinoma of the esophagus is frequently far advanced before diagnosis is made and operation undertaken, the ultimate percentage of cures of the disease by this new procedure will not be known until a series of cases have been observed for an adequate time after operation. It does seem clear, however, that this new technique not only will result in more cures than did previous methods, but that the life of the patient will be much more comfortable after this type of procedure than after the original one described by Torek—in which no attempt was made to restore gastro-intestinal continuity and the upper end of the esophagus was brought out through the neck. Certainly as a palliative, and very probably as a possible ultimate cure, the procedure of transthoracic esophagogastronomy will be of great value.

The Surgical Treatment of Congenital Malformations of the Heart. Of great interest during the past year was the report by Alfred Blalock and Helen B. Taussig concerning the development and clinical application of an operative procedure for certain congenital malformations of the heart. In these cases, because of stenosis or atresia of the pulmonary artery, there is an inadequate flow of blood through the lungs. The most striking feature of infants or children with this anomaly is persistent marked cyanosis. These are the so-called "blue" babies with whom all are familiar. In some instances, anomalies of this type are doomed; in others, survival up to or even beyond adolescence occasionally occurs. The prospects for living this long, however, are poor because of the danger of death from anoxemia or from blood clots in the brain. Furthermore, many of the children who do survive for several years are invalidated by extreme shortness of breath.

On the basis of the clinical studies of Taussig, and Blalock's experimental investigations showing the feasibility of uniting a large systemic artery to one of the pulmonary arteries, it was attempted to increase the blood flowing through the lungs by joining the severed end of one of the large branches of the aorta to one of the pulmonary arteries. It was hoped that the fundamental physiologic disturbance, which is an inadequate aeration of the blood due to decreased flow to the lung, might be remedied. In May, 1945, Blalock and Taussig reported that such a procedure had been carried out in three patients, each of whom had a severe degree of anoxemia. Each of these three survived and was apparently greatly benefited by the procedure. They state, "Clinical evidence of improvement has been striking and includes a pronounced decrease in the intensity of the cyanosis, a decrease in dyspnea and an increase in tolerance to exercise." In two of these patients, in whom the problem of the degree of oxygen lack could be studied by laboratory procedures, there was definite objective evidence of an increase in the oxygen content of the blood as well as of its oxygen saturation following the production of this artificial fistula between the aorta and the pulmonary artery.

It should be emphasized that not all such congenital malformations may be benefited by such a procedure, but only those in whom partial or complete obstruction of the pulmonary artery greatly limits the flow from the heart to the lungs and therefore results in inadequate oxygenation. The authors state, "The type of abnormalities which should be benefited by this operation are the tetralogy of Fallot, pulmonary atresia with or without dextroposition of the aorta and with or without defective development of the right ventricle, a truncus arteriosus with bronchial arteries, and a single ventricle with a rudimentary outlet chamber in which the pulmonary artery is diminutive in size. The operation is indicated only when there is clinical and radiologic evidence of decrease in the pulmonary blood flow. It must be emphasized that the operation should not be performed when studies reveal a prominent pulmonary conus or pulsations at the hili of the lungs." Since the procedure is a new and relatively untried one, the ultimate results cannot be predicted. It is possible that the production of an abnormal arteriovenous fistula of this type may later be associated with the development of a bacterial inception at the site of the anastomosis (subacute bacterial endocarditis), or that cardiac failure of the type occasionally seen in the presence of a persistent ductus arteriosus may occur. However, these risks are only conjectural ones, and it seems certain that at least these three children have been relieved from their present extreme incapacity and the danger of early death.

Since Blalock's report in May, a number of other children with serious malformations of this type have been subjected to operations and the greater part of these have been operated upon successfully.

The Surgical Correction of Coarctation of the Aorta. Coarctation of the aorta is an unusual congenital abnormality characterized by great narrowing of the lumen of the vessel, usually at or near its junction with the ductus arteriosus. The cause of this developmental anomaly is unknown. Although many persons with this condition may have a reasonably long life and suffer but little incapacitation, in others, serious complications are apt to develop if the degree of obstruction of the vessel is great. The most important of these is severe hypertension in the upper half of the body which may even result in heart failure, cerebral hemorrhage, or any of the other well known complications of high blood pressure. Less common complications are the development of aneurysmal dilatation above or below the zone of narrowing, rupture of the vessel, and finally, a bacterial infection of the aorta at the site of narrowing.

Recently, several groups of workers have studied the problem of relieving aortic obstruction by surgery. In September, Gross, of the Children's Hospital in Boston, reported his experience in division and suture of the aorta in the experimental animal and also in two patients. Gross's experimental studies made with dogs were aimed at developing a safe technic for exercising a portion of the aorta and reuniting the severed ends. He found that the animals withstood the complete occlusion of the aorta, which was required during the period of division and suture, very well as far as their heart was concerned, but that a certain percentage developed paralysis of the hind limbs presumably due to an ischemia of the lower portion of the spinal cord during the period of aortic occlusion. He devised special clamps, and after trying various methods of suture, found that a continuous through and through stitch which everted the divided ends

afforded the safest and most satisfactory closure. As a result of his studies, he was led to believe that it was technically feasible to remove a narrowed portion of the aorta en masse and to reestablish its continuity by careful and accurate end-to-end anastomosis. In June and again in July of this year, the procedure was carried out in two children. The first, a boy of six, withstood the operative procedure well, but as soon as the clamp was removed from the proximal end of the aorta and the enormous vascular bed opened up, the heart suddenly went into uncontrollable dilatation and the child died. This catastrophic experience emphasized the point that the aortic clamps must be removed slowly so that an unbearable strain will not be placed upon the heart.

The second patient, a twelve-year-old girl, was operated upon because of marked hypertension and not only withstood the operative procedure without incident, but made an uneventful recovery. The systolic blood pressure in the arms, which before operating was frequently found to be as high as 215, dropped after the procedure to 140, and the blood pressure in the legs, which was unobtainable before the operation, was recorded as 145 following operation.

Gross's successful case demonstrates clearly that this congenital anomaly, often the cause of invalidism and death, may be successfully treated by surgical means. It seems reasonable to suppose that with increasing experience, a successful outcome may be expected from the procedure in most cases.

It has been reported that the Swedish surgeon, Craaford, has successfully operated upon four patients with coarctation of the aorta by a technic similar to that described by Gross with a successful result in each instance. The report of Craaford's experiences is not yet available.

Portal Hypertension. This term is used for a condition characterized by increased pressure in the portal vein and its tributaries. This venous channel which carries blood from the gastro-intestinal tract and its appendages (gallbladder, pancreas, and spleen) to the liver may be obstructed in several different ways. Perhaps the most common obstruction, resulting in increased pressure within the portal system, is cirrhosis of the liver of the so-called alcoholic or Laennec's variety. The block, however, may be extrahepatic instead of intrahepatic. Extrahepatic obstructions are of two main parts. The first of these is a replacement of the vein or its main tributaries with fibrous tissue or scar tissue with little or no canalization. The most common causative factor in this type of obstruction is thrombosis of the portal vein or one of its main tributaries due to inflammation, trauma, pressure from without, or pressure from adjacent inflammatory or neoplastic tissue. The second rare cause of this chronic occlusion is seen in young children in whom the normal obliterative fibrotic process that takes place at birth in the umbilical veins and ductus venosus extends into the left portal vein or even into the main portal vein. Another variety of common occlusion of the portal vein, as yet poorly understood, is termed "cavernomatous transformation." In this condition, the vein or its main tributaries is replaced by a tortuous mass of small blood vessels.

As a result of chronic portal obstruction, due either to disease within the liver or to obstruction of the vein before it enters the liver, certain fairly typical clinical changes usually occur. This was noted as long ago as 1883 by Banti, and the term Banti's Syndrome is still commonly applied to this symptom complex although it now appears that

Banti's ideas concerning the etiology of the disease were not correct. The changes are enlargement of the spleen, anemia, a decrease in the white blood corpuscles and in the platelets plus evidences of the development of a few collateral circulations between the portal venous system and the systemic venous system, and finally characteristic histologic changes in the spleen.

The development of a collateral venous circulation affords a certain degree of temporary relief of the portal hypertension. Interestingly enough, it is hemorrhage from dilated esophageal veins which forms a part of the collateral pathway that is frequently responsible for the death of patients with portal obstructions. Fatal bleeding from esophageal varices is therefore common, especially with cirrhosis of the liver, and may even be seen in infants or young children in whom the portal block is due to extrahepatic obstruction of the veins.

Much of our present knowledge concerning the clinical aspects of portal hypertension is due to the careful study of Dr. Allen O. Whipple and his associates in the Spleen Clinic of the Presbyterian Hospital and the Department of Surgery at the Columbia University in New York. Recently Dr. Whipple and one of his colleagues, Dr. Arthur H. Blakemore, have devised a technique for shunting all or a part of the portal blood into the systemic circulation in cases of portal hypertension. This promises to be of great clinical value.

It should first be indicated that the previous surgical methods of treating portal hypertension have not been very satisfactory. Probably the most widely used measure was removal of the spleen. This procedure removed a large load of the portal blood, estimated to be about 40 percent of the total, and was usually followed by considerable temporary relief. In the rare cases in which the portal block was in the splenic vein, the removal of the spleen resulted in a permanent cure, but unfortunately, this is not a common site for a portal bed block; in the many cases where the block was either in the liver or in some other part of the portal veins distal to the splenic veins, the relief was only temporary. Other operations designed to improve the collateral circulation, such as the suture of the omentum to the abdominal wall, were not very satisfactory, nor were attempts to prevent bleeding by ligation of the veins leading into the cardiac end of the stomach and esophagus. As a matter of fact, these procedures, if successful, shunt off one of the chief collaterals between the portal and systemic circuits and increase the hypertension. There were usually, therefore, recurrent varices. Attempts at obliteration of the esophageal varices by the injection of sclerosing solutions also have not been very satisfactory. Whipple and Blakemore have tried two types of procedures in these cases. In the first, the spleen and left kidney are removed and the splenic vein anastomosed to the left renal vein. In the second type of procedure, the portal vein is divided just before it enters the liver and the lower end joined to the vena cava. These technical procedures have been made possible by development by Blakemore and his co-workers of a so-called nonsuture method of blood vessel anastomosis. In brief, this procedure consists of everting the end of a vein or artery over the end of a short funnel-shaped vitallium tube, the endothelial surface then being introduced into the end of another vein or artery to maintain the blood flow, thus avoiding thrombosis because of the intact endothelial lining. By using such tubes at either end of the vein grafts, vascular defects in arteries or veins can be effectually bridged. This

technic of Blakemore's has proved useful in a wide variety of vascular surgery, but seems nowhere more applicable than in the treatment of portal hypertension. In October, 1945, Dr. Allen O. Whipple reported that he and Blakemore had carried out ten operations for the relief of portal hypertension. In five, the splenic vein and left renal vein were united. In the last five, the portal vein was anastomosed to the side of the inferior vena cava. All patients survived the operations. While the procedures were purely experimental and were carried out only on patients who had had repeated severe hemorrhages and for whom conservative measures offered no hope, the early results have been very encouraging.

Dr. Whipple states that four other splenorenal vein anastomoses have been performed recently by Dr. Alfred Blalock, with disappearance of the ascites and remarkable improvement in two cases. In the other two, however, death from recurrent bleeding from esophageal varices occurred. Dr. Blalock thought that this might be due to occlusion of the anastomosis.

The efforts at portocaval shunt, while still in the experimental stage, seem to be the most rational attempts which have yet been devised to relieve portal hypertension, and it seems likely that they may find a real place in the treatment of the victims of portal vein obstruction.

WILLIAM H. POTTS.

MELLON INSTITUTE. The aim of Mellon Institute is the creation of new knowledge by scientific investigation, in accordance with the institution's definite fellowship system. According to this procedure the researches are restricted to major problems of the pure and applied sciences and particularly chemistry—problems that require protracted periods of time for solution by specialists. The Institute was founded by Andrew W. Mellon and Richard B. Mellon in 1913 and is located at 4400 Fifth Avenue, Pittsburgh, Pa. It is a non-profit institution.

The industrial research of the Institute is organized on a contract basis, the problem being set by a person, firm, or association interested in its solution, the scientific worker being found and engaged by the Institute, and an industrial fellowship being assigned for a period of at least a year. Each holder of an industrial fellowship is given broad facilities for accomplishing the research entrusted to him and all results belong exclusively to the donor of the fellowship. Only one investigation is conducted on a specific subject at any one time and hence there is no duplication of the research activities of the fellowships in operation. At present there are 94 of these industrial fellowships, which employ 474 scientists and engineers. The projects range from ferrous metallurgy and refractories to novel pharmaceuticals or medicinal agents, synthetic rubber, new plastics and textiles, and improvements in foods and other essential commodities. All the work during wartime has related to urgent military problems. The Institute's department of research in pure chemistry is concentrating on the synthesis of antimalarials.

MENNONITES. A religious group founded in Switzerland in 1525 in protest against ecclesiastical rule and rigid liturgy. In the United States the Mennonites first settled at Germantown, Pa., in 1683, ultimately dividing into 17 bodies. For statistics, see RELIGIOUS ORGANIZATIONS.

MERCURY (Quicksilver). Use of more than one-half of all the mercury consumed in the United States

in 1945 for the production of so-called "tropical" dry cells constituted probably the most spectacular development in any of the common metals in 1945. These batteries, which have the advantage of minute size, constant electrical output, and resistance to climatic deterioration, first appeared as a major consumer late in 1944 and almost as rapidly declined following the end of the Japanese war. The feasibility of their adaptation to peacetime uses probably will determine to a large extent postwar demand for mercury.

Mercury consumption during 1945 totalled approximately 63,900 76-lb. flasks, with a rapidly declining rate of use after the middle of the year. In 1944, 42,900 flasks were consumed. Principal uses, other than in battery manufacture, were for pharmaceuticals, electrical apparatus, paint, disinfectants and fungicides, and as a detonator for explosives.

Domestic mine production dropped to 30,600 76-lb. flasks in 1945 as a direct result of a price decline from an average of \$165.55 per flask in February to \$108 per flask at the end of the year. Mercury was released from price control Aug. 29. Although many mines ceased or curtailed operations, about 69 per cent of the production came from California, with smaller amounts from Oregon, Idaho, Nevada, Texas, Arkansas, and Alaska. About 40,000 flasks were imported from Spain during the peak of the battery program, constituting the first heavy imports from this source since the beginning of the war. Total imports from all sources were 71,508 flasks in 1945. About 20,000 flasks were in private stocks and 63,640 flasks in government stocks at the end of 1945.

CHARLES T. POST.

METEOROLOGY. The Weather Bureau. During the fiscal year ending June 30, 1945, the improved military situation permitted the Weather Bureau to resume a portion of its regular services which had been curtailed at the outbreak of the war. Nevertheless, the Weather Bureau's activities were still directed primarily toward service to the war effort, especially to war industries, agriculture and transportation, including air commerce. The Weather Bureau gave direct aid to the military services through a number of special projects and by loan of meteorologists for active theater assignments; direct aid was also provided for a few of the military units within the United States, and the general activities of the Weather Bureau were coordinated with military plans and operations through the Joint and Combined Meteorological Committees of the Army, Navy and Weather Bureau.

With the end of the war in Europe, military restrictions on the publication of weather information were lifted and the Weather Bureau began reconversion of its services to peacetime uses. Weather news quickly resumed its place in the daily press and radio as one of the more important and newsworthy subjects.

After the close of the war in the Pacific the Weather Bureau continued its progress in reconversion to a peacetime basis and also took up the problem of reinstating those of its employees who had served in the armed forces and of whatever other veterans it could use. The more important service activities of the Weather Bureau are described briefly below.

In the meteorological service for aviation, weather forecast coverage was increased during the year to meet demands for both the airways and the terminals. Service was added at 14 terminals bringing the total number of terminals for which

regular forecasts are issued to 272. The mileage of civil airways for which airway forecasts are made was increased about 500 miles to a new total of 34,885 miles. The Flight Advisory Weather Service, established in 1943 to serve the needs of the Army Air Forces Flight Service units in Airway Traffic Control Centers of the Civil Aeronautics Administration, was enlarged. The Weather Bureau also expanded its transoceanic weather service during the year and assisted in plans for postwar international air commerce. The special ocean forecasting units at New York, N. Y., Baltimore, Md., Washington, D. C., and Miami, Fla., were enlarged in order to give better service to both civil and military transoceanic flights.

Several important developments in the hurricane warning service were made during the year. The program for reconnaissance flights by military pilots into storm areas or suspected storm areas was augmented, thus providing increased numbers of observations from significant places which might be of aid in determining the strength and location of these tropical disturbances. Three automatic weather stations were established in the Florida area for getting and transmitting information from remote points. Two of the stations are on islands considerably east of the southern tip of the Florida Peninsula, while the third is at Cape Sable. These stations, which are completely unattended except for periodic servicing, broadcast the barometric pressure and the wind speed and direction at scheduled intervals. These installations are designed to withstand the passage of a hurricane and the information from these robot stations is of much value in supplementing the information from the regular and more accessible stations. The special teletype circuit, already in use, for the transmission of hurricane information was extended to connect with Charleston, Savannah, Atlanta, Austin and Fort Worth and an additional special circuit was installed, connecting forecast offices at Boston, New York, Washington and Miami in order to provide closer coordination during hurricanes.

The Horticultural Protection Service or "Fruit-Frost" Service has furnished specialized forecasts for orchard heating and other frost protection measures. The lifting of the military restrictions on weather information in the United States permitted the increased use of radio for getting the forecasts to the fruit growers. Considerable progress was made in the development of service for agriculture in general wherever personnel and facilities could be obtained. At a number of new places, microphones were installed in Weather Bureau Offices through the cooperation of local radio stations, and weather broadcasts were directed to farmers, ranchers, and other agricultural interests. The Fire-Weather Service, furnishing localized forecasts to fire-control agencies in forest areas, was expanded.

The Flood forecast service was also expanded. The development of techniques for forecasting runoff from mountain snow fields two to six months in advance was continued and forecasts of this type were prepared for the Columbia River Basin in the spring of 1945. The forecasts permitted the formulation of plans for irrigation and power generation for longer periods of time than in previous years. Research in the subjects of snow measurement and the physics of snow was continued and a new type of snow storage gage capable of operating for an entire winter without attendance was perfected and field installations made. The quantitative rainfall forecast service, also an aid to river forecasting as well as to flood control work and hydroelectric power development, was improved. During the

year two more cooperative reporting networks (in the Snake and Delaware River Basins) were organized bringing the total number of such networks to 18. This work has been carried on in cooperation with the U.S. Army Corps of Engineers, and will supply additional reports for use in flood control operations and flood forecasting.

The Weather Bureau continued its collaboration with the United States Army Corps of Engineers also in connection with the storm classification program and during the year 80 additional studies of storms were completed. The Weather Bureau prepared a report on thunderstorm rainfall which is expected to be published shortly; this report is an exhaustive compilation of data which were analyzed, charted and tabulated and is part of the basic preparation for the intensive program of thunderstorm research about to be undertaken by the Weather Bureau.

Several improvements in the printed Washington Daily Weather Map were begun. The reverse side of this map is now devoted to special articles, charts, climatological studies, and other material designed to be of use in the interpretation of the weather map and in its application to problems affected by weather.

A recorder was developed for use with the ceilometer, which the Weather Bureau plans to install at all major airports. This instrument will provide a continuous record of cloud height over a station as well as the presence of precipitation or fog.

The Latin American meteorological training program, begun in 1943, continued; eight new students were brought to the United States for training at the professional level. Of the group which began training the preceding year some were given further training at San Juan, P.R., in tropical meteorology while the others were given intern training at Weather Bureau forecast centers to learn firsthand how to give efficient weather service to transportation, industry and agriculture. As an adjunct to this training program the Weather Bureau translated two elementary books on applied meteorology into Spanish.

Other activities of the Weather Bureau during the year worthy of mention have been in connection with international cooperation in meteorology. The atmosphere envelops the globe, and meteorological science with its applications in various kinds of services is dependent on world-wide exchange of weather reports. Through the State Department Office of Cultural Relations with American Republics, funds were secured to establish a radio-sonde observational program at the National Observatory of Cuba at Havana. In Mexico the radio-sonde observations are also made under a cooperative agreement similar to the one arranged with the Cuban Government. Arrangements were made with French West Indian officials, through the State Department, for more weather reports. International cooperation was also promoted by a visit of Weather Bureau Officials to Russia with scientists from other fields and other countries as a result of an invitation in June from the Russian Academy of Sciences.

The regular appropriation for the Weather Bureau's use for the fiscal year ending June 30, 1945, was \$12,700,000 and for that ending June 30, 1946, is \$12,540,000. The full-time personnel on June 30, 1945, was 3,975.

Hurricanes. During 1945 there were 10 tropical hurricanes in the North Atlantic.

I. Hurricane of June 20-27. This tropical storm formed in the western Caribbean Sea between

Swan Island and the coast of Honduras. From here, the storm, attended by moderate gales and squalls, moved through the Yucatan Channel and Gulf of Mexico in a general northerly direction to latitude 27.5° where it turned abruptly northeastward and crossed the Florida peninsula and moved into the Atlantic between Daytona Beach and St. Augustine on June 24. Over the Atlantic it continued to move northeastward remaining nearly parallel with and about 60 miles away from the coast. Damage from this storm was not heavy and no deaths or serious injuries were reported. Communications were disrupted over small areas and there was some damage to crops and buildings mainly from the excessive rains and flooding rather than the high winds. In most areas the passage of the storm was more beneficial than damaging as the heavy rains which accompanied it broke a 12-months drought which had become one of the worst in Florida's history.

II. Storm of July 19-21. This was a slight disturbance formed in the western Gulf of Mexico. It moved in a general westerly direction and crossed into Texas a little to the north of Brownsville.

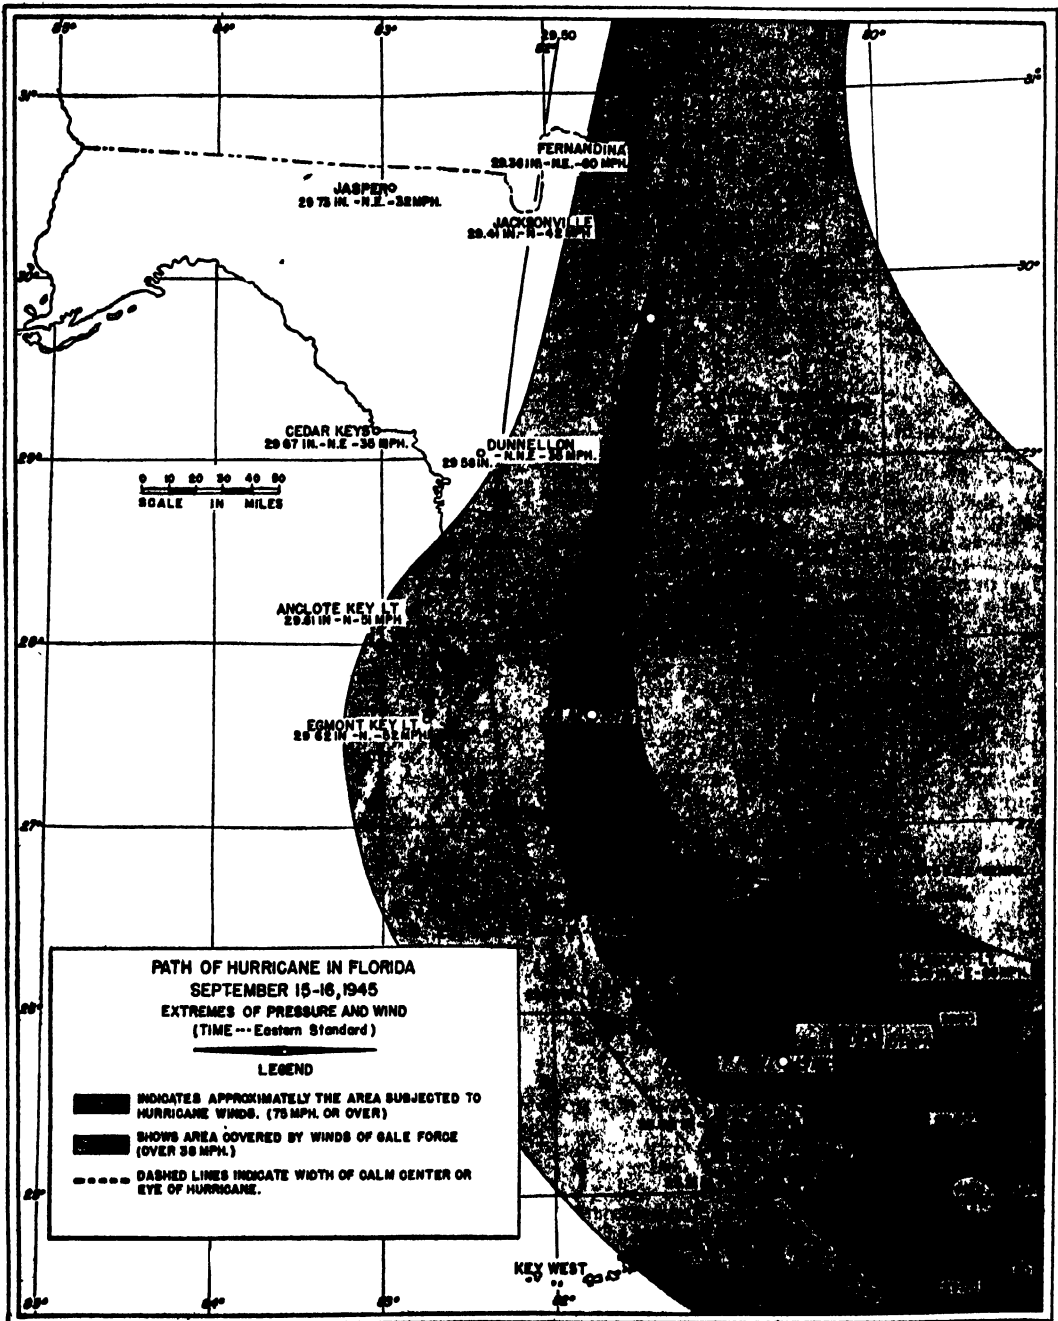

III. Tropical disturbance of August 2-4. This storm appeared east of the Lesser Antilles on August 1, moved west-northwestward between the islands of Guadeloupe and Dominica on the 2nd and thence passed south of Puerto Rico. It crossed the southern coastline of the Dominican Republic on the 4th and dissipated as it moved inland. No winds over Beaufort force 9 (47-54 miles per hour) accompanied the storm.

IV. Tropical storm of August 17-21. This storm moved about parallel to the one which immediately preceded it (August 2-4) but its path was about 200 miles farther north. No winds stronger than Beaufort force 9 accompanied this storm; it dissipated over the ocean between Cuba and the Bahama Islands.

V. Storm of August 24-29; "The Texas Hurricane." This was one of the most severe hurricanes in Texas history. Damage at Corpus Christi and in other areas along the south coast was the heaviest since the destructive September hurricane of 1933. While the area of hurricane winds and gales associated with this storm was only moderate, records show that no hurricane of such intensity ever paralleled the coast of Texas for so great a distance. Fully two-thirds of the Texas coast and the off shore islands were subjected to winds of full hurricane force. The center of this storm moved inland near Pt. Aransas; at this station a 20-minute lull in the wind between 1 and 2 A.M. (Local Standard Time) on the 27th indicated the passage of the eye. The center passed a short distance south of Seadrift, Texas and to the north of Port O'Connor but neither of these places experienced a calm although they are only 19 miles apart. This storm dissipated in the interior of Texas on the 29th. The highest recorded wind was 105 miles per hour at Port O'Connor when the anemometer was broken. Winds of 135 miles per hour were estimated. The lowest pressure recorded was 28.57 inches at Camp Hulen, Palacios, Texas. Tides were built up considerably as a result of the slow forward movement of the center; Port Lavaca had a tide of 15.0 feet. At Houston, 13.03 inches of rain fell during the passage of this storm, in fact, 9.39 inches of this total fell within a six-hour period; along the coast rainfalls were estimated as high as 30 inches.

Only three deaths were caused by this hurricane. Property damage, however, was high, over \$20,000,000.

VI. Storm of August 30-31. This was a slight tropical disturbance which originated in the Carib-

PATH OF FLORIDA HURRICANE OF SEPT. 15-16

bean Sea and moved westward and crossed inland at Belize, British Honduras and then dissipated.

VII. *Storm of September 3-4.* This storm originated south of the west end of Cuba and moved generally northward nearly to Tampa, Fla., where it became extinct. It was of slight intensity.

VIII. *Storm of September 10-12.* This storm was first observed east of the Leeward Islands. It moved northwestward and then curved to the northward and faded out just as it passed 100 miles west of Bermuda on the 12th. This storm was never

a well developed system but at the time it was northeast of the Leeward Islands reconnaissance planes estimated winds of 60 miles an hour.

IX. *Hurricane of September 11-20. "The Florida Hurricane."* This was the most severe hurricane in 1945. It was first noted east of the Leeward Islands on September 11 and thence moved on a west-northwest course passing north of Puerto Rico on the 13th and very near Turks Island the following night. It began a slow curvature to the northwest while passing over the Great Bahama Banks

during the night of Sept. 14-15 and struck Florida with its center over Key Largo on the afternoon of the 15th. The storm then traversed the Everglades and passed out into the Atlantic near St. Augustine on the night of the 16th. After leaving Florida, the storm skirted the coast of Georgia and passed into South Carolina near Parris Island on the morning of the 17th. The winds of the storm steadily diminished but heavy rains accompanied it until it finally became lost in the New England States.

The highest wind recorded was 138 miles per hour at Carysfort Reef Light. The lowest pressure recorded was 28.09 inches at the Homestead Army Air Base.

Only four people were killed in Florida, but the property damage was about \$60,000,000. Most of this was in Dade County. In the Bahama Islands 28 people were killed. The motor vessel "Captain Roberts" was sunk on the Bahama Bank as a result of this hurricane.

X. Storm of October 2-4. This was a slight disturbance which moved nearly parallel to the path of the storm of August 30-31 but about 100 miles south.

Floods. There were notable floods during the year and a number of new records were established. The most outstanding flood, from the point of view of the nation's economy was that on the Ohio River in late February and March. This flood was the result of precipitation centered over the Ohio Valley. The flood was more severe on the main stream, from Pittsburgh to Cairo, than on the tributaries, none of which were in extreme flood. The Ohio River started to rise in the latter part of February and culminated in March. The stage attained by this flood was higher than all others during the present century except those of 1913 and 1937 at Portsmouth, Ohio, Cincinnati, Ohio, Evansville, Ind., and Cairo, Ill., and the intervening reaches of the river between these cities. Above Portsmouth, Ohio, the stages reached in 1945 were also exceeded in other years besides 1913 and 1945; but at Louisville, Ky., the 1945 flood was exceeded only by that of 1937.

The Ohio River normally shows a rise in stage during the winter months, reaching a peak in March and falling steadily to a lowest stage during the summer months. The past year, 1945, was no exception to this rule, it was just an extreme example. Most of the Ohio Basin suffered from a serious drought after May, 1944, resulting in quite low river stages. During December, 1944, and January, 1945, large amounts of snow accumulated in Western Pennsylvania. The snow cover there by early February was as great as and in some places exceeded the amounts that prevailed prior to the disastrous flood of March, 1936. A series of heavy rains began the second week in February and lasted until March 7 and covered most of the Ohio Basin. As heavy rains continued intermittently, the river rose steadily, exceeding the established flood stage of 40 feet at Cairo, Ill., on February 23. Two days later the river reached flood stage at Evansville, Ind., and on the 27th and 28th the flood level was exceeded at Cincinnati, Ohio, and Pittsburgh, Pa. By the 4th of March the entire Ohio River was in flood. On March 5-6, the final rainstorm of the series occurred with the heaviest rain directly over and along the entire river causing the river to rise sharply. The total rainfall during the period February 7 to March 7 exceeded 8 inches over a wide belt, the center of this belt being almost directly over the Ohio River.

Rapidly rising flood waters resulted in loss of life and heavy property damage by flooding of

large areas of low farmlands, by closing of coal mines and many industrial plants manufacturing war materials and by disrupting transportation and flooding of many homes. According to records of the American Red Cross 24 lives were lost as a result of the flood.

The floods of March and April in the rivers of Kansas, Missouri, Oklahoma and Arkansas, were important and it was these floods which established most of the new records. Rainfall over the state of Arkansas during March was unusually heavy, averaging over 11 inches, for the entire state. Many stations recorded a depth of 15 inches for the month and a few as many as 18 inches. All rivers in Arkansas exceeded flood stage in March. Two or more rises occurred on all the rivers and the lower portions of the White and Ouachita Rivers were in flood the entire month. In March, rain was also heavy in Kansas and Oklahoma and some flooding occurred in these states.

Frequent heavy rains from late March through the middle of April over a broad belt from Kansas and Missouri southward to Louisiana and Texas produced widespread flooding in this area. Run-off was above normal in the area for the preceding three months and soil conditions were thus favorable for a very high percentage of run-off from the April rainfall. The Missouri River exceeded flood stage from Kansas City, Mo., downstream, but maximum stages were not approached. The flood in the Gasconade River was within two feet of the crest reached by the record stage of 1897, and the Osage River at La Cygne, Kans., approached within a tenth of a foot the record stage reached by the flood of April, 1944. Below (east of), the Kansas-Missouri line, the flood in the Osage River was relatively less severe. During April many of the Arkansas River tributaries in Arkansas, Missouri, Kansas, and Oklahoma reached stages near or above the highest stages ever recorded. At Seminole, Okla., a little more than 12 inches of rain fell in 9 hours on April 13; many of the smaller streams in the vicinity of Seminole were several feet higher than ever before known, and some loss of life was reported. Record stages were exceeded on the White River, and the crest of the Arkansas River at Van Buren, Ark., exceeded slightly the stage reached in May, 1943 (however, the peak discharge at Van Buren was about 200,000 c.f.s. less according to the U. S. Geological Survey). Record-breaking stages were reached on the Ouachita, Black, Little, Sulphur, Cypress, and Red Rivers as well as many of the smaller streams in this area. The Red River flood in Louisiana was particularly severe and caused extensive damage. At Fulton, and Garland, Arkansas, on the Red River the stage reached was 1 foot higher than the previous record; at Grand Ecore, La., it was 5 feet higher. Widespread damage resulted to roads, railroads, homes and farms. The American Red Cross reported that nearly 40,000 persons were evacuated from their homes; and it is estimated that about 1,500,000 acres of rich farming and grazing lands were flooded.

High water stages prevailed in the Lower Mississippi River and the Atchafalaya River throughout the month of April. Crests reached in the Mississippi River below the mouth of the Red exceeded the stages reached during the flood of 1937 but they were from 1 to 2 feet below record stages. The stage at New Orleans, La., was kept below 20 feet by diverting water through the Bonnet Carre Spillway.

The month of September was wet over most of the United States; the total fall for this month

was the greatest of record in Missouri, Oklahoma and West Virginia, while in several other states it was the wettest September in the last 10 to 20 years. Arkansas had the largest total since 1913 and the second greatest of record. This excessive precipitation for September caused light to moderately high overflows in some of the streams of Virginia, West Virginia, and eastern Pennsylvania; and high but not extreme flooding in the tributary streams of the Red River and the middle Arkansas basin. This excessive September rainfall was in part the cause of the record breaking floods in the eastern portions of North and South Carolina but these floods were primarily due to the Florida Hurricane which crossed the South Carolina Coast Line near Charleston and moved slowly northward across the central Carolinas. Previous flood records were broken in the Cape Fear, Haw, Neuse and Pee Dee Rivers. In the other rivers of the Carolinas the rainfall was sufficiently favorably distributed so that extreme flood stages were not attained. At Fayetteville, N.C., the flood crest was 68.9 feet compared to 68.0 in 1908 and at Elizabethtown the 1945 stage was 43.2 compared to 39.1 in 1928. At Cheraw, S. C., on the Pee Dee River the stage reached 49.4 feet, exceeding the previous record of 1908 by 2.2 feet. At Effingham, S.C., the Lynches River exceeded the previous record by 1.2 feet and at Moncure, N.C., on the Haw River the flood stage exceeded the previous record by 4.7 feet.

The other floods during the year were of a local, rather than a general character. Nevertheless, a number are worthy of mention.

Heavy rains were frequent throughout May over the upper Mississippi Basin and flood stages were a constant threat at this time in Nebraska, Iowa, Kansas and Missouri. Rainfall was generally well distributed during the month and high or unusually high stages were not reached except for the record breaking flood in the Nishnabotna River in southwestern Iowa. This stream reached a stage of 20.5 feet at Red Oak, Iowa, 2.0 feet higher than the previous record there in 1937.

In June heavy rains continued in Iowa and in Indiana. While these rains did not cause excessively high river stages, their continuation resulted in the Des Moines River being above flood stage as many as 40 days during the four months from March to June. The Wabash River in Indiana was above flood stage for 72 days at Hazelton during these four months and over 60 days at a number of other places.

In July the most important flooding was the local overflows of smaller streams which resulted from heavy concentrations of rainfall in the region from Virginia to Maine. These local overflows caused considerable damage. A severe downpour in Rutland County, Vt., on the 20th and a series of cloudbursts over western Berkshire County, Mass., on the 22nd caused considerable damage to highways, bridges, crops and livestock. These floods are of considerable interest because the U.S. Geological Survey reported that Rathbun Brook near Hancock, Mass., with a drainage area of slightly less than 1 square mile, had a discharge of more than 3,200 c.f.s. per square mile. This was reported to be the highest rate of flow on a per square mile basis ever recorded in New England. Albany, N.Y., experienced the wettest July since 1871. Much of the precipitation fell in thunderstorms of cloudburst proportion, and numerous flash floods were reported during the month. The most important was on the 22nd over Rensselaer and Columbia Counties; on this day dry creek beds became raging tor-

rents, lake levels were raised 2 or 3 feet; headwater creeks rose to record heights, washing out bridges, highways, railroads and buildings.

In August severe local floods occurred in West Virginia between Charleston and Montgomery; in the vicinity of Clinton, Iowa; and in the north portion of Salt Lake City, Utah. Considerable damage was caused by each of these local overflows.

In October the greatest flood of record since the completion of the new State Barge Canal system in 1918 occurred in the upper Mohawk River in New York. This rainstorm and flood took place during the first 3 days of the month. Due to the heavy rainfall over this area in the preceding months reservoirs were at high levels prior to the storm and the ground water level was near its maximum; therefore, the percentage of run-off was especially high. While the stages of this year's flood were the highest since regular records have been kept, they were not so high as the stages reached in 1913, 1902 or 1901 or in the memorable year of 1869, in all of which there were floods in the Mohawk River.

For the 12 months ending Sept. 30, 1945, the flow in the Mississippi River at Vicksburg averaged 763,300 c.f.s. which is 135 percent of normal and the greatest in the 15-year record since 1930. (The flood peak at Vicksburg on April 10, 1945, was 1,940,000 c.f.s. and was second only to that of February 1937). The annual flow of the St. Lawrence River below Lake Ontario averaged 246,000 c.f.s. which is 112 percent of normal. The Columbia River near The Dalles, Oregon, averaged 151,100 c.f.s., 76 percent of normal; although greater than the preceding year, 1945 ranks among the lowest of record in the Columbia River.

Meteorological Progress. Radar is affected by weather and notably by precipitation. For this reason radar instruments developed for war purposes may play an important role in the future of observing and forecasting the weather. The use of radar to detect storms began as early as August, 1943.

Much interest has been created in the airplane flights into tropical hurricanes. A number of important papers have been published about these flights and Wexler has constructed a rather complete sketch of the structure of a tropical hurricane from observations made on his flight into the hurricane of September, 1944. His observations were made when this hurricane was located east of Cape Charles, Va. Wexler's sketch shows winds blowing inward and with a slight downward component below the base of the main cloud layer, while above this layer the winds are ascending and blowing outward. At the eye of the storm the winds descend while immediately around the eye the ascending winds are strongest.

Information has been released that fog was dispersed from airfields in England during the war by burning oil. Following long research and experimentation which considered the use of supersonic waves, electrical discharges, absorption of moisture by chemicals, drying by refrigeration and air-conditioning apparatus, the oil burning proved to be successful. It was found that if the temperature of the atmosphere over an airfield could be raised 7° Fahrenheit the fog disappeared in that air. The heat was provided by a continuous line of oil burners installed parallel to, and some distance from, each side of the main runway. Under normal conditions fog can be cleared in ten minutes and about 6,000 gallons of fuel oil for each aircraft landed.

Interest in constant pressure free air maps has

been stimulated. For some years past upper air temperature and humidity observations were plotted on charts at fixed heights above sealevel. On July 1 the Weather Bureau put into use charts where the temperature, humidity and height are plotted for fixed pressure levels. J. R. Fuiks and others have published papers recently on the advantages of the constant pressure over the constant level chart.

The American Meteorological Society appropriately celebrated its twenty-fifth anniversary in 1945.

RICHMOND T. ZOCH.

METHODIST CHURCH. The Crusade for Christ, the five-fold quadrennial program of advance, adopted by the General Conference of 1944, absorbed the attention of the 41,067 Methodist Churches in the United States during the year. The task, according to the plan, was the raising of \$25,000,000 for post-war relief and reconstruction. Promotion of this, under the leadership of Bishop J. Ralph Magee of Chicago, began in the fall of 1944. During the first three and a half months of 1945 more than \$27,500,000 was pledged by the churches over and above all regular giving. At the year's end 22 million had been collected and distribution was under way. Among gifts made was the presentation in the Greek Embassy in Washington of \$25,000 for the use of Archbishop Damaskinos, Greek regent, in aiding the children of his country. The donation was thought to be of special interest since, crossing interfaith lines, it was obviously humanitarian and not sectarian.

Evangelism is the current emphasis of the Crusade for Christ, the need for which was made apparent by the fact that of 21,104 pastoral charges, 3,360 did not receive, during the last year of record, any new members except by transfer. A goal of a million new members has been set. Effort to make new Christians, and to revive the interest of the million and a quarter inactive and non-resident members, is being carried on through schools of evangelism for pastors and lay workers in all the 33 episcopal areas. The New Life movement, led by the Rev. Dr. Albert E. Day, who resigned the pastorate of First Church, Pasadena, Calif. to assume its leadership, has been an outgrowth of the evangelistic emphasis of this year. It will work through preaching missions and a weekly publication called *New Life*, of which Dr. Day is the editor. General leadership of the evangelistic phase of the Crusade is being given by the denomination's Board of Evangelism at Nashville, Tenn., Dr. Harry Denman, executive secretary.

Bishop Charles C. Sealeman of Dallas was chosen in April as president of the Council of Bishops. In December the Council issued a strong pronouncement against peacetime compulsory military training. In this Bishop Charles Wesley Flint of Washington dissented, putting out a statement approving the policy as a temporary measure.

The Methodist Commission on Chaplains, with

headquarters in Washington, reported, when war ended, that more than 1,650 Methodist ministers had served as chaplains. Of these 132 received 162 decorations for valorous conduct. Twenty-one deaths occurred, nine in action and twelve from illness. It was estimated that of Methodist ministers who could meet the requirements of age, education and physical fitness, at least one in four was in the chaplaincy.

Statistics for the latest twelve-month period for which figures are available show a membership of 8,046,129, an increase of 66,966 over the preceding year. The church has paid a total of \$116,223,876 for all purposes. Included in this is \$42,035,097 for ministerial support; \$26,629,932 for local church expenses; and for regular benevolences, \$15,050,181, an advance of nearly six million. The Women's Society of Christian Service, which enrolls 1,161,389 members, raised \$7,017,113 for home and foreign missionary and other causes. A reduction of indebtedness of a third on churches and parsonages is recorded, \$12,197,248 having been devoted to this purpose. The committee on Overseas Relief, headed by retired Bishop Herbert Welch, New York City, raised and disbursed \$673,296. The Board of Publication this year exceeded all previous records, reporting gross sales of \$8,315,232. Following its long custom, \$400,000 of the produce of the year was allocated to retired ministers. In December Benjamin A. Whitmore of Nashville, Tenn., one of the two publishing agents, resigned after twenty years service.

The only death among the bishops occurred on Jan. 10, 1946, Bishop J. Lloyd Decell of Jackson, Miss. Bishop Brenton T. Badley of Delhi, India, retired and was succeeded by the Rev. John A. Subhan, a Mohammedan convert. The Rev. Arthur A. Wesley, a missionary, was elected Bishop to succeed Bishop Juan Gattinoni in Buenos Aires. Missionary Bishop John M. Springer completed his work in South Africa. In China Bishop Ralph A. Ward, long interned by the Japanese, was released. Bishop F. H. Otto Melle of Berlin reported wide destruction of Methodist property in Germany. Bishop Edwin F. Lee of Singapore has been heading the General Commission on Army and Navy Chaplains in Washington, until his field opens. During the summer he made a flying visitation of chaplains in the Pacific Islands. Bishop G. Bromley Oxnam of New York, as president of the Federal Council of Churches, represented American Protestantism at the enthronement of the Archbishop of Canterbury in April, followed by an official visit of Protestant chaplains in the Mediterranean and Africa-Middle East theaters. In November he was one of three churchmen to visit German church officials. Bishop James C. Baker of Los Angeles, as chairman of the International Missionary Council, served as one of the advisors of the United States delegation at the San Francisco United Nations conference. In the autumn he was one of four churchmen, who, with the approval of President Truman and Gen. MacArthur, visited the Christians of Japan.

The death of Mrs. Henry Pfeiffer of New York City on Jan. 8, 1946, lost to Methodism perhaps its most outstanding benefactor of all time. With her husband, the late Henry Pfeiffer, she gave buildings or substantial contributions of endowment to more than 50 church related colleges on three continents, and contributed to numerous other church philanthropies.

The unification of the three major branches of Methodism in the United States, effected in May 1939, has been completely confirmed, both in the

complete consolidation of its organization and by court decision. Denied the right to use the names of any of the former churches which united, a small die-hard group from the former Methodist Episcopal Church, South, organized this year 22 pastoral charges into the "Southern Methodist Church."

MEXICAN CLAIMS COMMISSION, American. A Commission established pursuant to the provisions of the Settlement of Mexican Claims Act of 1942. Under this Act the Commission adjudicates claims and makes awards to claimants entitled to participate in the distribution of a lump sum settlement recently effected by the Department of State whereby the Republic of Mexico pays \$40,000,000 to the United States in settlement of claims. Participating claims have originated over a long period extending from 1868 to 1940 and include claims relating to the expropriation of lands and mines, confiscation or destruction of personal property, injuries to individuals, and miscellaneous cases of alleged denial of justice. Chairman: Edgar E. Witt.

MEXICO. A North American republic. Area: 758,258 square miles. Population: 21,153,321 (1943). Capital: Mexico, D.F.

Mexico consists largely of a plateau of 8,000 feet average elevation bordered on the east, west, and south by mountains. Coastal lowlands extend along the Gulf of Mexico and the Pacific Ocean, and Yucatán Peninsula in the southeast is a vast lowland plain. Throughout the plateau area of northwestern Mexico and most of Baja California the climate is dry, with temperatures ranging from cool-temperate to hot. The southern part of the plateau region has a temperate dry-winter climate, which merges into tropical in the southeast and Yucatán Peninsula.

Government. Under the Constitution of 1917, Mexico is a federal union of 28 states, 3 territories, and the Federal District. The Congress is bicameral, with a Senate of 58 members and a Chamber of Deputies of 147. Regular sessions begin on Sept. 1 of each year. The President is elected for a 6-year term and may not be reelected. He is aided by a Cabinet of 11 ministers. General Manuel Avila Camacho was elected President on July 7, 1940, and inaugurated on Dec. 1, 1940.

The People. Over half of the total population of Mexico are mestizos; 29 percent are Indians, and 17 percent persons of European descent. Population density is highest in the central highlands, lowest in the north and southeast. The three largest cities are: Mexico, 1,448,422; Guadalajara, 228,049; and Monterrey, 180,942.

Spanish is the official language, but some minority groups speak their native tongue and various Indian languages are spoken in rural areas. Roman Catholicism is the predominant religion.

In 1938, official estimates indicated that 55 percent of the adult population of Mexico was literate. In 1941 there were 23,191 primary schools with a total enrollment of 2,037,870. Excluding students in normal schools, 64,758 students were registered in 388 intermediate schools. Mexico has 13 universities.

National Economy. Mexico's economy is based upon agriculture and mining. Corn is the principal crop and staple food. Other important domestic crops are: beans (second in importance), wheat, sugar, cotton, rice, chickpeas, and fruits. Food crops exported in significant amounts include bananas, coffee, and winter vegetables. Stock raising is also an important industry; recent estimates indicate

that Mexico has 12 million cattle and 5 million hogs. Henequen, produced in Yucatán, is the chief fiber raised, but others are grown in small quantities. Forest products include chicle, wild rubber, copra, and lumber. Production figures for 1944 for leading agricultural crops: corn, 2,440,483 metric tons (est.); rice, 118,409 metric tons of paddy; bananas, 440,465 metric tons. For 1944-45: wheat, about 396,467 metric tons; sugar, 371,630 metric tons; cotton, 495,988 bales.

Minerals constitute a large part of Mexico's exports, and equipment for mines accounts for a good part of its imports of capital goods. Mexico's major mineral product by value is silver; it leads all other countries as an exporter of this metal, and produces 40 percent of world output. Petroleum, lead, and gold are other important minerals, and copper, zinc, mercury, tin, antimony, iron, tungsten, manganese, bismuth, and cadmium are also produced. Crude petroleum production in 1944 amounted to 36,120,000 barrels; refined oil was valued at 337,687,000 pesos. Other mineral production in 1944, (in millions of avoirdupois pounds): zinc, 483.9; lead, 409.5; iron, 297.5; copper, 91.3; manganese, 64.2; antimony, 24.2; silver, 5.1; (in thousands of avoirdupois pounds) molybdenum, 2,640.9; mercury, 1,757.2; tin, 733.9; tungsten, 353.2; bismuth, 365.5; gold, 35.

Manufacturing in Mexico is chiefly confined to consumer goods, with little development in the heavy industries. In the past 2 years, however, Mexico's industrial growth has been phenomenal, and there are now over 28,500 factories employing more than 512,000 persons. The cotton textile industry has recently reached major proportions as a national industry. It includes some 200 mills with a capital investment of about 150,000,000 pesos. Sales value of production in 1944 amounted to 480,000,000 pesos. Silk and rayon textiles are also made. Processing of foods is an important industry, and in addition, such articles as cigarettes, leather goods, cement, paper, and glassware are manufactured.

Foreign Trade. Mexican exports in 1943 were valued at 1,127,457,000 pesos. Commerce during the war years was almost exclusively confined to the U. S., imports and exports to that country both reaching 85 percent of the total value in 1944. Merchandise exports to the U. S. in 1944 amounted to \$204,000,000, a 6 percent gain over 1943. Major exports consist of raw materials, principally metals. Other exports in 1944: bananas, 5,812,129 stems; cotton, nearly 30,000 metric tons, and 4,000 tons of lint; cattle, 290,000 heads; henequen, 87,000 metric tons.

Mexican imports in 1943 were valued at 910,030,000 pesos. In 1944 Mexican imports from the U. S. reached \$264,000,000, an increase of 42 percent over 1943. The value of imports of agricultural, mining, and industrial machinery increased from 67,000,000 pesos in 1940 to 143,000,000 pesos in 1944, more than 100 percent. Imports consist chiefly of manufactured and semi-manufactured goods, and foodstuffs.

Events, 1945. President Manuel Avila Camacho told Mexico, in his New Year's message, of plans to improve the country's economic, industrial, and social structures. The major campaign was against illiteracy, he said.

But the first problem the Government faced was a scandal in which hundreds desiring to work in the U. S. were charged for fraudulent documents. The Attorney General began an investigation of the transactions, in which various deputies were said to be involved. A criminal court judge ordered

detention of three accused deputies and sought a special session of Congress to remove their parliamentary immunity. This was done, and the three men were arrested on Feb. 12.

In the spring, political activity began in preparation for the 1946 Presidential elections. Early in May President Avila Camacho declared that the nation would be completely free to choose his successor, the only restriction being that the next President must continue to abide by the Constitution. Later that month, as a result of reports that some churchmen were taking an active interest in the campaign, Archbishop Luis M. Martínez ordered the clergy to abstain from participation in political activities.

Shortly before this, after a meeting of a thousand regional *jefes* (chiefs) of the rightist, nationalistic Sinarquista movement, leaders announced officially that they were openly resuming their activities (the Sinarquista newspaper had been suppressed and meetings forbidden the previous summer). The organization announced it would aim at "implantation of the Christian social order" and the "salvation of Mexico," but emphasized that "Sinarquismo is not governed by the Church, whose aims are higher and more elevated."

The annual rally of the Sinarquistas was held at León, Guanajuato, on May 19-20. The former Supreme Chief, Manuel Torres Bueno, resigned and was replaced by Gildardo González Sánchez. He pledged himself to heal the split which had disrupted the organization in 1944, but a leader of the extremist minority which had broken away branded his election as "spurious." Sinarquista leaders denied any responsibility for a series of anti-Protestant outbreaks in centers where their movement was strong. On Aug. 27, the National Sinarquist Union, announced that it "is not a political party and will not participate in the coming elections as one."

On June 5 Interior Minister Miguel Alemán resigned to seek the presidential nomination of the official Party of the Mexican Revolution (PRM), the only organized national party in Mexico. Two days later the Confederation of Mexican Workers (CTM) endorsed his candidacy, and the later concurrence of other groups within the PRM made his eventual nomination as the government candidate almost inevitable. In accepting the CTM's endorsement, Alemán stated that inflation was Mexico's greatest problem. He defended freedom for private enterprise and "legitimate profits" for foreign capital. Labor leader Vicente Lombardo Toledano, who introduced Alemán, outlined a "new strategy for labor in the postwar period," consisting of association with enlightened bourgeois and progressive forces against "powerful monopolies in the victor countries that now may wish to capitalize on the allied victory." Lombardo's position as head of the Latin American Labor Federation (CTAL) gave this program its significance. Mexico City Mayor Javier Rojo Gómez and General Miguel Henríquez Guzmán, who had been campaigning for the presidency, withdrew from the race when the CTM backed Alemán; Primo Villa Michel was named Interior Minister to replace Alemán.

At the beginning of July President Camacho outlined a program of complete army reorganization designed to modernize all army branches and to prevent military men from entering politics. He also announced that nearly 600 generals and 800 colonels on inactive duty would be retired on pensions to make room for young men with modern training.

Defending himself against charges that his for-

eign policy was too subservient to that of the U. S., Foreign Minister Ezequiel Padilla resigned on July 11; on Sept. 1, he was replaced by Francisco Castillo Nájera, Ambassador in the U. S.

On Aug. 28, the President accepted the resignation of former President Lázaro Cárdenas, who had been War Secretary since the summer of 1942.

President Camacho, in his fifth annual message to a joint session of Congress, opening on Sept. 1, asked for "a moral understanding among nations of the world" to guarantee humanity the freedoms for which it fought. He predicted increasingly closer relations between Mexico and the U. S., and reaffirmed Mexico's traditional friendship for the Spanish people and the Spanish republican Government-in-exile. Mexico's two main tasks, the President said, were industrialization and education, and he promised free elections for the choice of his successor in July, 1946.

Two days later Padilla announced he would be a candidate for President, if "the people want me." In a scathing indictment of the present regime, he urged the President to forbid governors and municipal and government officials to participate in propaganda campaigns for presidential candidates, to enact an electoral law that would ensure freedom of voting, and to restrain the PRM from using the army as a means to muzzle "the aspirations of the people."

The seventh annual convention of the Catholic party, Nationalist Unification Movement, voted on Sept. 23 to take an active part in the campaign, and the rightist National Action Party opened fire on the administration for its alleged failure to solve educational and economic problems. In October, the National Central Revolutionary Party was formed to back General Guzmán, whose campaign had continued despite his professed withdrawal.

The first bloodshed of the campaign took place on the first Sunday in November, when several Padilla supporters were reported injured in a street fight near the candidate's Mexico City home.

In a speech accepting the nomination of the newly formed Democratic Party, on Nov. 25, Padilla denounced the Mexican elections system as undemocratic and accused the PRM of using government funds to finance the campaign of Alemán. He declared that if elected he would work to end government monopolies and encourage private industry. "Totalitarian, oppressive, and sovietizing forces" were at work in Mexico, he charged. The Alemán trade unions countered by calling Padilla the U. S. supported candidate. The labor paper, *El Popular*, also charged that Padilla had the backing of the Catholic Church, which, it said, "operates as a political party under the direction of the Vatican."

The last entry in the presidential race was General Enrique Calderón, supported by the Popular Redemption Party, who opened his campaign in December.

The President announced late in November that he would soon present to Congress a bill creating a nonpartisan electoral council to supervise election polls. He urged the parties "not to fight" and declared that he was "personally completely disinterested" in the election results, but was "determined to maintain the principle of national unity with moral, and if necessary, material force." Padilla's party criticized the President's proposals as inadequate to meet their complaint that the electoral machinery permitted the government party to control the voting.

The campaign was becoming more intense as the year ended. Three were reported dead and

86 wounded on Dec. 23 in a series of clashes at Cuernavaca and nearby towns between Alemanistas and Padillistas.

Economic Developments. Economically, 1945 was troublesome but hopeful for Mexico. Inflation continued to be the main problem: The Bank of Mexico's cost-of-living index showed a 300 percent increase over the 1934 level. As a result, the country was plagued by strikes throughout the year, complicated by crop losses from natural causes, and wartime shortages of consumer goods.

On Jan. 12, Petróleos Mexicanos (PEMEX), the government oil monopoly, announced that its 1945 budget of \$87,000,000 was \$9,000,000 higher than the 1944 budget. Proposed production of 46,254,000 barrels of crude oil was 10 million barrels more than the preceding year's production. For the first time, it was said, payments to U. S. companies for their expropriated properties would come from profits. The Mexican Embassy in Washington on Oct. 2 presented to the Department of State a check for \$4,085,327, representing the second installment on the oil-expropriation debt.

On Apr. 8, labor leaders and representatives of industry signed a pact in which they agreed to cooperate in the postwar period "to realize Mexico's industrial revolution," and smooth the transition to the industrialization of the country.

A two-year extension, effective July 1, of the Mexican-U. S. currency stabilization agreement, was signed in Washington on June 13.

On the following day, Mexican exports to Europe were resumed, when a cargo left for Switzerland. A Mexican economic mission returned from Europe on July 4. It reported that it had accomplished important studies of products that Mexico could buy and sell, as well as plans for air and maritime transportation. It was expected that petroleum would be one of the first products to be shipped to Europe.

On Sept. 13, the Finance Ministry issued a list of products for which import licenses would be required. This was assailed by both Mexican and U. S. businessmen as a step toward artificial protection of Mexican industries.

Late in September, the U. S. Government raised the price it would pay for foreign silver. This caused the Bank of Mexico to suspend all sales of silver coins to the public, and a number of Mexican-owned marginal mines prepared to resume operations.

On Oct. 9, Kuhn, Loeb and Co. announced the rapid public over-subscription of 197,500 shares at \$23 each of Industria Eléctrica de México. This was the New York Stock Exchange's first major foreign industrial issue since the beginning of the war. Two days later, Mexican Finance Minister Eduardo Suárez predicted that listing of Mexican securities on the New York exchange would soon become a general practice.

On Dec. 28 the Chamber of Deputies received for study a record high 1946 budget of approximately \$243,000,000, of which \$31,000,000 was allocated for debt service, \$63,500,000 for national defense, \$42,000,000 for education, \$11,500,000 for public health, and \$1,100,000 for labor.

Declaring that Mexico's peacetime economy would differ greatly from that of wartime, the National Chamber of Commerce in August asked for intensified agricultural and industrial output. And in the same month Finance Minister Suárez said that he believed Mexico would survive postwar economic readjustments in good order. "There will always be a heavy world demand for silver and most other metals," he declared, adding that the

peso would be maintained at its present value, and that "we plan to continue our public works program during the postwar period, and the emphasis will be on highways, railroads, ports, and irrigation."

Foreign Relations. Mexico became the second Latin American country to participate actively in the war when the 201st Aviation Squadron, numbering approximately 300 men, sailed for the Pacific war zone on Apr. 8. It saw its first action on June 11, in a raid on Luzon, and was received by 200,000 cheering Mexicans when it returned home on Nov. 19.

It was announced on Nov. 4, that Mexico had been elected a member of the administrative council of the International Labor Organization.

Relations with U. S. A check for \$448,000, delivered on Jan. 2, completed payment of installments on bloc settlement of U. S. damage claims incurred during the Mexican revolution; total payments amounted to \$5,448,000.

In a joint report issued by Presidents Avila Camacho and Roosevelt on Jan. 28, the Mexican-U. S. Commission for Economic Cooperation was declared dissolved. President Roosevelt praised the achievements of the Commission, established 16 months before to aid Mexico in supplying essential war materials. The report reviewed the commission's projects and predicted large-scale developments of "major significance" in the next few years, during which Mexico plans to spend \$383,000,000 on industrial development programs. These would require at least \$94,000,000 of foreign capital equipment during the next two years and another \$43,000,000 in 1938. Despite the war, Roosevelt said, the U. S. delivered to Mexico more products for its consumption and the maintenance of its economy in 1943-44 than in any previous two-year period.

On Apr. 18, the U. S. Senate ratified the Mexican-U. S. water treaty by a vote of 76-10. The Mexican Senate took the same action in the fall, and the treaty was signed in Washington on Nov. 8. It covered allocation of the waters of three great international rivers: the Rio Grande (Rio Bravo), which separates Mexico and the U. S.; and the Colorado and Tiajuana rivers, which flow from the U. S. south into Mexico.

The treaty had been debated long and hotly in the Senate Foreign Relations Committee and on the floor of the Senate. Opponents had charged that it guaranteed Mexico too much water, removed control of the Colorado River from States whose agriculture is dependent on it, and was generally ambiguous and likely to lead to misunderstandings. There were also objections in the Mexican Senate.

On Dec. 17, U. S. Ambassador George Messersmith inquired of the Mexican Foreign Secretariat if there was any "definite evidence" to support charges made by labor leader Lombardo Toledano that "certain U. S. firms" had smuggled weapons to the rightist Sinarquista Union for the purpose of fomenting an armed rebellion designed to put in power a pro-U. S. quisling as President of Mexico. Lombardo made it clear that he was referring to Padilla. The Mexican Government disavowed the charges and stated that Lombardo had failed to substantiate them.

Relations with Other Countries. Soviet Ambassador Constantin Oumansky, his wife, and several members of his staff were killed on Jan. 24 when a Mexican air-force plane crashed and burned immediately after taking off on a scheduled flight to Costa Rica, where Oumansky was to present his credentials as Minister. On Oct. 7 an official report

placed responsibility for the accident on a pilot's error and reported no evidence of sabotage.

Mexico recognized the Spanish republican Government-in-exile on Aug. 27.

HARRY B. MURKLAND.

MIDWAY ISLANDS. A group of islets located in the Pacific, 1,804 statute miles northwest of Honolulu. Although Midway was discovered by Captain N. C. Brooks in 1859 and known as Brooks Island, the name was later changed because of the position of these islands in the mid-Pacific, i.e. 2,800 miles from California and 2,200 miles from Japan. It was formally declared a United States possession on Aug. 28, 1867, by Captain Reynolds of the U.S.S. *Lackawanna* who made a survey of the islands.

The U.S. Navy Department has had complete jurisdiction over them since July 4, 1903. The total land area of all the islets is approximately 28 square miles. Sand Island is one and a half miles long and one mile wide, consisting of 850 acres, and serves as an important cable relay station of the Commercial Pacific Cable Company in the service between San Francisco and Shanghai. Eastern Island is somewhat smaller than Sand and contains only 328 acres. Midway Islands have been used as a naval air station and as an air depot between Nov. 24, 1935, and Dec. 7, 1941, by Pan American Airways on their transpacific route between San Francisco and Manila. The population of Midway has always been small, in 1940, it was 437.

Events, 1945. In testimony presented before the Pearl Harbor Investigating Committee in December, Captain Toshikazu Chima, former Japanese Chief of Naval Operations, was quoted as saying "The Midway defeat changed the course of the war."

CHARLES F. REID.

MILBANK MEMORIAL FUND. A Fund established in 1905, with assets of \$9,176,407.29 at the end of 1944. Appropriations for grants and projects in that year totalled \$237,702.00. The scope of the Fund, while widely diversified, has been principally in the field of public health. At present its special interests in this field are nutrition, housing, population trends, and the appraisal of public health methods and procedures. In 1944 twenty-four organizations received funds. President: Albert G. Milbank. Executive Director: Frank G. Boudreau, M.D. Offices: 40 Wall Street, New York City.

MILITARY PROGRESS. The cessation of hostilities in the greatest war in history resulted in revelation of military weapons heretofore kept secret. Some of these, particularly in the guided missile category, together with the atomic bomb, have brought great changes in military thinking and planning. Yet military authorities generally believe that the new scientific weapons have not made the fighting ground soldier any less necessary to war and military defense. Rather, they contend, he becomes increasingly important as a means by which the enemy's source of lethal weapons and his bases of operations may be seized. General of the Army George C. Marshall, U.S.A., in his report as Chief of Staff, cites the men necessary to deliver the first atomic bomb on Hiroshima.

"First," Gen. Marshall said, "we had to have the base in the Marianas from which the plane took off. This required preliminary operations across the vast Pacific, thousands of ships, millions of tons of supply, the heroic efforts of hundreds of thousands of men. Further, we needed

the B-29's and their fighter escort which gave us control of the air over Japan. This was the result of thousands of hours of training and preparation in the United States, and the energies of hundreds of thousands of men.

"The effect of technology on the military structure is identical to its effect on the national economy. Just as the automobile replaced the horse and made work for millions of Americans, the atomic explosives will require the services of millions of men if we are compelled to employ them in fighting our battles."

The redeployment of forces from Europe to the Far East following the collapse of Germany, and the subsequent demobilization procedure after the surrender of Japan brought military problems which, while not new, surpassed in scope and magnitude any similar ones in history.

Guns. In the new recoilless rifles developed by the Ordnance Department of the U.S. Army, the striking power of field artillery has been put into the hands of the infantry soldier. The American development was considered to be an improvement over the recoilless 75-mm brought out early in the war by the Germans for the use of their parachute troops. The first two U.S. models, the 57-mm and the 75-mm recoilless rifles, were produced in time to be tested in action both in Europe and in the Pacific. The 57-mm model is small and light enough to be operated as a shoulder weapon, while the 75-mm fires from a standard machine-gun tripod.

Although they resemble rocket weapons, the new guns use conventional artillery shells. The recoil of artillery is avoided by permitting a controlled portion of the propellant gases to escape through openings in the breech. The amount of pressure permitted to escape through the rear exactly counter-balances the force required to propel the shell through the rifled tube. Because of the loss of pressure through the breech openings these weapons do not have the range of conventional artillery. Nevertheless, within their range they are highly accurate.

The 57-mm rifle weighs only forty-five pounds, is sixty-one inches long, and fires a high-explosive shell weighing nearly three pounds a distance of two miles. The 75-mm rifle weighs 110 pounds, is eighty-two inches long, and fires a fourteen-pound shell more than four miles. Besides being used as a shoulder weapon, the 57-mm may be fired from a small bipod with the gunner lying prone. A two-man team handles each of the weapons. Their light weight adapts them particularly to the use of airborne troops. The 17th Airborne Division used them in an operation across the Rhine River in March, 1945.

Other new American weapons included a 105-mm anti-aircraft gun weighing 46,000 pounds and with a range of 46,000 feet. The U.S. Army's largest mobile anti-aircraft gun, its fire can be controlled manually or by the T38 anti-aircraft director.

Also in the anti-aircraft field, the U.S. Army developed an electronically operated locator for keeping anti-aircraft searchlights automatically trained on enemy planes.

A new 155-mm "Long Tom" gun was developed and mounted on an M4 tank chassis. It fires a 95-pound shell up to 25,000 yards. Mounted on the M4 chassis is a new eight-inch 41-ton howitzer with a range of 18,500 yards.

The U.S. Army also produced a 10-inch mortar capable of firing a shell every two minutes at a range of five miles.

Another development was a modification of the semi-automatic carbine to permit fully automatic firing. In the converted carbine full automatic fire at the rate of 750 rounds per minute may be delivered by a trip of the selector. By reverse movement of the selector, semi-automatic fire is restored. The new action, accomplished by a slight alteration of the basic mechanism and the addition of a few new parts, adds only two ounces to the weight of the weapon. It proved particularly effective in the house-to-house fighting along the Rhine.

An effective weapon was produced by the British Army in their new 7.2 howitzer, operated by heavy batteries of the Royal Artillery. The weapon weighs ten tons and fires a 200-pound shell up to 16,000 yards. The howitzer is mounted on a carriage fitted with pneumatic tires five feet six inches in diameter. The recoil of the weapon is controlled by hand-operated brakes and ramps, placed behind the wheels when the gun is in action.

A novel gun produced by the Germans, too late for effective use, was a curved-barrel machine carbine capable of shooting around corners. With it a rifleman could fire from behind a wall, corners of houses, out of windows, or from any such concealed and protected position. The bullet travels along the straight portion of the barrel propelled by a small charge, but as it hits the curved portion escape ports release some of the back pressure reducing its velocity as it swings through the curve. Particularly ingenious is the mirrored-periscope sight with a prismatic corrector which permits the rifleman to sight his odd weapon.

Little is known of the Soviet Union's new artillery weapons, employed so effectively on the Eastern Front. Writing from Moscow and describing the May Day parade, C. L. Sulzberger of the *New York Times* tells of "gigantic two-section, tractor-drawn howitzers and mortars, which as far as the eye could estimate, exceeded in size even those rumored 360-mm pieces the Soviet Union is said to possess." Mr. Sulzberger said:

"The enormous mortars or howitzers displayed today are certainly larger than the famous German 'Satan.' They easily surpassed in muzzle span the tremendous rifles, mounted on their own caterpillars and hauled by giant tractors, that preceded them in the procession. The howitzers made the heavy siege guns look diminutive and transcended in size the other vast, squat twin-section howitzers also in the parade, which may themselves well be the long-rumored 360-mm Red Army secret gun."

Tanks. Flotation devices for tanks, not revealed until after the war, played important parts in landings both in Europe and the Pacific. The first, developed by the British, was known as the DD swimming device and was used to land British and American tanks in the invasions of Southern France and Normandy. It was a boat-like canvas structure, fitted above the tank tracks, enabling medium tanks to swim to land from distances up to four or five miles at sea. Because the canvas came high up the sides of the tank, its primary armament could not be used during the water trip, but as the tank came up the beach and out of the water the sack was deflated, freeing the guns for action. Because of their low silhouettes, the tanks made poor targets in the water. However, many were lost in rough weather by water washing over the tops of the canvas sacks. Some, too, stalled in the sand on landing.

Subsequently a new flotation device for medium tanks was developed and successfully employed in the invasion of Okinawa and other Pacific islands. Known as the M-19, it consisted of metal cans

fastened to the front, rear and sides of the vehicle. The cans were filled with plastic foam material weighing less than two pounds per cubic foot. Because of the cellular construction of the filler, the cans retained their flotation qualities even when pierced by gun fire. In addition the tanks were equipped with bilge pumps to withdraw water entering through leakage or wave action. A similar device was developed for heavy tanks but was not put into quantity production because of the end of hostilities.

The Japanese brought a new type of amphibious tank into use in the Philippine campaign. Pontoons were built to attach to the front and rear of the tanks, which were driven in the water by a pair of propellers mounted between the tracks in the rear. The rear pontoon was equipped with a rudder.

The British developed and used several types of tanks to carry and lay bridges over which they, and following vehicles, could cross wide ditches or craters. The bridge-laying mechanism is operated automatically by controls from within the tank. These bridges can span widths up to thirty feet or pass over walls about ten feet high. The various types include the "Scissors" bridge, a folding span carried on top of a Valentine tank. The bridge is laid by being automatically unfolded and lowered by a mechanism operated from inside the tank. Another, the Churchill bridge-layer, consists of a 30-foot span of steel trackway, raised by an arm on the tank hull, carried forward and lowered across the gap in front of the tank.

Both the British and the Germans made use of tanks as anti-aircraft vehicles. The German "flak wagon," used during the Ardennes drive, consisted of a revolving turret mounted on a tank chassis. The armored turret was equipped with four machine guns firing in pairs. The British anti-aircraft tank employed a Crusader chassis and mounted twin Oerlikon anti-aircraft guns. A similar chassis mounted a 40-mm Bofors anti-aircraft gun.

As an improvement over their Tiger tank, the Germans brought out a new model, the Royal Tiger, first reported in December, 1944, against the French in Alsace. Most of the Royal Tigers carried an improved version of the 88-mm gun, while some models mounted a 105-mm gun. A power-operated turret replaced the hand-operated one of the earlier version. The frontal armament was increased to a thickness of twelve inches. Greater flotation over bad terrain was provided by much wider tracks than previously used. A low silhouette made it a difficult target in the field.

At Oberembt, Germany, an infantry battalion of the XIX Corps of the U.S. Ninth Army captured from the Germans a huge 380-mm mortar, or howitzer, mounted on a chassis of the new Royal Tiger tank. The mortar barrel was seven feet long and rifled. The shell itself weighed 770 pounds, was five feet long and fifteen inches in diameter. The shells, of which the tank carried twelve, were loaded into the tank by a crane and into the breech of the mortar by a hoist built into the tank. The shell was propelled by an internally carried charge, which gave it a range of about 5,000 to 6,000 yards. The tank also carried a .34 caliber machine gun and a grenade launcher. The turret was not movable.

The British provided heavier armament on many of their tanks by replacing their three-inch howitzer with a 95-mm howitzer firing a shell of high capacity filled either with high explosive or smoke. The high trajectory of the howitzer made it possible to "lob" shells over buildings or hills at tar-

gets out of the direct sight of the tank gunner.

The latest U.S. Army tank was the heavy M-26, a 43-ton vehicle armed with a 90-mm gun, two .30 caliber machine guns, and one .50 caliber machine gun. This tank, named the General Pershing, is powered with a 500-horsepower, V-8, liquid-cooled gasoline engine, which gives it a highway speed of twenty-five miles per hour. The frontal armor is four inches thick, but the angle at which it is placed affords an actual head-on thickness of 6.9 inches.

Balloon Bombs. A novel Japanese development was the bomb-carrying pilotless balloons which utilized the west to east air currents to fly from Japan to North America. These had been in use for some time and many had landed in the United States, but information concerning them was withheld by censorship to prevent leakage of data to Japan which might aid in improving their accuracy or damage-creating capacity.

These balloons, about 34 feet in diameter, were made of five layers of oiled paper inflated with hydrogen which carried them to altitudes of between 25,000 and 35,000 feet. As they lost altitude from leakage, barometric pressure switches operated to drop sandbags causing them to rise again. When they reached North America (in about 80 to 120 hours) similar switches operated to drop explosive and incendiary bombs as they passed over the country. The last switch operated to destroy the balloon itself.

About 10,000 were launched, their release often being accompanied by ceremonies and speeches at which bonds were sold. Some damage was done in this country and a few lives lost, but on the whole they were ineffective. After the war, Staff Officers in the Technical Section, Japanese Headquarters, stated that the idea was abandoned on April 20, 1945, because the device had failed both as a morale booster for the Japanese people and as a scare weapon for the Americans.

Radar. Although every one of the major warring powers possessed at the outbreak of the war some form of radio direction finding and ranging apparatus (originally called radar in the United States and radiolocation in Great Britain), it was not until Aug. 14, just after the Japanese had signified their desire to surrender, that the Allies released for publication detailed information, as to its operation and use. In 1943 a general statement had been released, but even discussion of that was subsequently placed under censorship.

The German radar was said to be skilfully designed and rather efficient, but apparently continued and intensive research by the Allies found ways of outwitting and surpassing it. The Japanese model seems to have been of the most elemental type, so far behind those of the other powers as to be almost useless.

The first operational radar system to have been installed is claimed by the British whose Air Ministry decided in December 1935 to establish a chain of five stations on the east coast of England. Since that time the whole coastline of Great Britain has been ringed with radar stations keeping continuous watch for hostile approach. To this radar system the British give a large share of the credit for defense against the German aerial blitz.

While beginning as a detection device, giving the direction, distance, and altitude of airplanes, the uses of radar in offensive and defensive warfare grew to great proportions. In the Navy it was used not only to locate and detect enemy vessels but also to lay their guns on the target even though darkness or haze prevent seeing the enemy. Also

through radar detection of shell splashes in the water, fire could be corrected to a high degree of accuracy. Radar played an important part in the Battle of the Atlantic by locating German submarines which came to the surface at night. In naval warfare radar played its part as early as the Battle of Cape Matapan in March 1941, and subsequently in the Scharnhorst and Bismarck actions. The United States Navy made highly effective use of it, particularly at the Battle for Leyte Gulf (Second Battle of the Philippine Sea), when numbers of Japanese vessels were located and sunk at night by radar directed fire.

Similar fire by coast guns in Britain sank eleven out of eighteen German ships at twenty-mile range in the dark. Artillery radar also may be used to locate tanks at night.

To the air forces radar became so important that B-29 pilots often referred to their planes as "flying radar sets," for on them were radar devices to assist in long range navigation (Loran); identification of fighter support, identification of friendly aircraft, blind bombing apparatus, identification of ships, altimeters, beacon navigation, and for replies to ground interrogation.

Another radar device guides bombing or troop carrier planes to their destination, even advising them when they are over their target or dropping area.

A valuable adaption is the "tail warning set" by means of which the pilot of a single seater fighter plane is given warning of the approach of another plane by means of both a bell and a signal light. This set weighs only 15 pounds.

The "IFF," "Identification, Friend, or Foe," set operates in a system with ground interrogator sending out impulses, and plane set sending back reply. Interrogator sets are also installed in planes. As the set used in the plane is triggered by another set, it actually is not pure radar. This equipment weighs about 39 pounds.

The radar altimeter measures the distance to the ground directly below the plane.

BTO, or "Bombing Through Overcast," has been termed one of the greatest single contributions to strategic bombing. By its means ground targets may be picked up and bombs directed even though the crew cannot see the ground by visual means. Early sets had 40 controls, but later models, used by the B-29's, have only 18.

The Atomic Bomb. The most remarkable military weapon to come out of this war, and the most destructive ever employed, is the atomic bomb, developed and produced in the United States after four years of research at a cost of more than \$2,000,000,000, by a group of scientists principally American and British but including a number from other nations.

The first atomic bomb used against an enemy was dropped from a U.S. Army B-29 bomber over the Japanese city of Hiroshima on Aug. 5. The second was used against Nagasaki on Aug. 9. On Aug. 10 the Japanese submitted their offer to surrender, making mention of the new and terrible weapon being used against them.

The atomic bomb as first used had more power than 20,000 tons of TNT and more than 2,000 times the blast power of the British "Grand Slam"—the largest bomb previously used in warfare. The destruction wrought upon the cities of Hiroshima and Nagasaki was very nearly complete, with terrific loss of life, many dying later from wounds and burns inflicted by the single bomb burst. On Dec. 30, Shichiro Kihara, mayor of Hiroshima, reported that of the pre-bombing popula-

tion of 310,000, a total of 139,000 was dead. This included 58,267 killed outright and those who died subsequently from wounds, burns, or shock. About 500 persons were still in city hospitals. Homes destroyed or damaged totalled 39,809. An area about two and a half miles in diameter was almost completely flattened.

Inevitably, a demand arose for regulation of the military use of this new and destructive power. In November Prime Minister Attlee of the United Kingdom and Prime Minister King of Canada, met in Washington with President Truman to discuss the problem. In an "Agreed Declaration" made public at the close of their talks they referred to the atomic bomb as a means of destruction "against which there can be no adequate military defense" and signified their intention not to release their special information to other nations until safeguards have been worked out.

"We are not convinced," the three leaders said, "that the spreading of the specialized information regarding the practical application of atomic energy, before it is possible to devise effective, reciprocal, and enforceable safeguards acceptable to all nations, would contribute to a constructive solution of the problem of the atomic bomb. On the contrary we think it might have the opposite effect. We are, however, prepared to share, on a reciprocal basis with others of the United Nations, detailed information concerning the practical industrial application of atomic energy just as soon as effective enforceable safeguards against its use for destructive purposes can be devised."

They then recommended that a Commission be set up under the United Nations Organization to make specific proposals:

- (a) For extending between all nations the exchange of basic scientific information for peaceful ends,
- (b) For control of atomic energy to the extent necessary to ensure its use only for peaceful purposes,
- (c) For the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction,
- (d) For effective safeguards by way of inspection and other means to protect complying states against the hazards of violations and evasions

Meanwhile, additional atomic bombs have been produced in the huge and expensive plants built under the "Manhattan Engineer District" of the Corps of Engineers of the U. S. Army which, directed by Maj. Gen. Leslie R. Groves, U.S.A. had charge of the entire atomic bomb project.

Rockets and Guided Missiles. Startling progress has been made in rockets and guided missiles, much of which doubtless is still in the secret category. Rockets continued to be used more and more effectively on all fronts. Multiple mobile mounts increased in use both on land and at sea. The Germans used a number of versions. The "Nebelwerfer," a six barrel projector firing 75-pound rockets with war heads of five and a half pounds of TNT, was employed against the Third United States Army at ranges of one to three miles. The "Wurfkoerper" was a little larger projector. A long range rocket carried projectiles about 25 miles.

A particularly effective use of the rocket principle was the bomb devised by the British Admiralty and Ministry of Supply. Dropped from B-17's, these rocket-propelled bombs struck concrete shelters, submarine pens, underground factories, etc., with velocity sufficient to penetrate very thick concrete walls and explode on the inside.

Guided missiles of many categories were put into use. Some are operated by internal combustion engines, others by reaction engines, some by rockets; some are guided by mechanical devices, some by

electronics, some by radio. All carry destruction and have even greater potentialities in the future. Officials talk of devices which will automatically guide themselves to sources of heat, to light, to concentrations of metal, etc., thus being capable of automatically hitting factories, airplanes, or other selected targets.

Gen. H. H. Arnold, U.S.A., Commanding General Army Air Forces, speaking of "observable trends" in August, said:

"One—manned or pilotless aircraft travelling at supersonic speeds. With such speeds aerial combat as we know it—fighters seeking out other fighters or bombers, and exchanging gun fire in an attempt to shoot each other down—will disappear.

"Two—the extraordinary development of guided missiles and the refinement of their controls so that exact hits can be made on targets of a mile square or less, at any part of the world, from any part of the world.

"Three—improved atomic bombs. They will be destructive beyond the wildest nightmares of the imagination—a weapon ideally suited to sudden unannounced attacks in which a country's major cities might be destroyed overnight by an ostensibly friendly power.

"Four—great developments in the field of defense both against aircraft and against guided missiles by means of target-seeking antiaircraft missiles of rocket or other type. It will undoubtedly continue to be true that every new weapon of offense will eventually be countered by an at least partly effective means of defense. Against the supersonic planes and the highly developed guided missiles of the future it is probable that a defense in the form of missiles automatically seeking out those planes and missiles and destroying them or some of them, in the air, or the stratosphere, or the ionosphere, will be developed.

"Five—perfected communications systems between air and ground making possible the most intricate maneuvers either by piloted planes or pilotless missiles.

"Six—an extraordinary development of the techniques of launching, landing and supplying airborne forces who can be dropped completely equipped at any point in the world is a matter of hours."

"None of these things is visionary, or merely possible," General Arnold said, "They are probable to the point, almost, of inevitability. If we have another war—if another aggressor arises to strike the peace-loving nations—it will be with things like these that he strikes."

Proximity Fuze. A most remarkable device and one that was most closely guarded was the VT or Proximity Fuze, which automatically explodes a projectile as soon as it comes close enough to its target to inflict damage. The VT fuze was developed by scientists of the Office of Scientific Research and Development at the request of the Navy Bureau of Ordnance. The research program was carried on in facilities provided by the Carnegie Institution of Washington and Johns Hopkins University.

The fuze is a very small, but rugged, five-tube radio sending and receiving station, fitted into the nose of a projectile. A vacuum tube sends out electro-magnetic waves which are reflected back by any target that gives a radio reflection, such as metal objects, water or earth. Thus, if a VT-fuzed projectile passes within 70 feet of an airplane, reflected impulses act on the fuze circuit to trigger a switch detonating the main explosive charge.

The Navy protected the VT with elaborate secrecy. On the fighting fronts, great care was taken to keep "duds" from enemy hands. Except for the limited use of the device during Britain's battle against the buzz-bomb, the Combined Chiefs of Staff declined to permit the fuze to be used on land until October 25, 1944. Prior to that time the Navy even avoided firing VT-fuzed shells near islands of the Pacific.

The fuze was particularly successful against Japanese Kamikaze, or suicide, planes and against the German buzz-bombs. During the German drive in the Ardennes it was used in land artillery against ground troops. By exploding over the heads of groups of advancing troops, the weapon was considerably more effective than shells fuzed to explode on contact with the ground.

Engineering. Always important, the role of the engineer in World War II exceeded that in any previous conflict. Col. Alejandro Melchor, Philippine Military Adviser, reported that "There were more engineers in the invasion of Leyte than infantry or troops of any other branch of the service."

The Channel pipeline laid by British engineers in cooperation with the British Navy, was known as operation Pluto. From Aug. 12, 1944, to May 8, 1945, it delivered 120,000,000 gallons of gasoline to the Allied armies in Europe. Flexible pipe was used, it being laid full of water to prevent kinking. Twenty lines were stretched across the channel. The actual laying was accomplished by a force of vessels ranging from 10,000 ton ships to barges and motorboats. The U.S. Army and Navy were working on a similar project using steel pipe, but this was dropped to avoid duplication.

The pipeline to China, authorized by the Quebec Conference, was built by U.S. Army engineers in two sections, one the ABC (Assam-Burma-China) Section and the other from Calcutta. The joining of the two permitted the pumping of fuel directly from the tanker docks at Calcutta to Kunming, in China. Jungles, monsoons, and disease took their tolls, but work went forward steadily in the face of difficulties. At times the construction was carried on just behind the battle lines.

Other important pipelines included that laid from French invasion coast to United States forward areas on the Western Front. This line carried as much as 3,800,000 gallons of fuel a day. Also announced during the year was a double oil pipeline across the Isthmus of Panama.

Particular progress was made in the development of mobile and floating power plants. In Russia much reliance was placed in electric power trains. A Soviet bulletin reported that these trains "invariably follow in the wake of the advancing Red Army. Since the first days of the offensive, mobile stations have traveled to the front with the armored trains and have rendered invaluable service to tank and truck repair shops, supplying them with power." American built power trains were of 1000-kilowatt units and some of 3,000 kilowatts, the latter being a train of nine specially built railroad cars which can be hauled at fast-freight speed and put into service within about eight hours after arrival.

Largest of the U.S. Army's floating power plants was the "Inductance," which, while it was kept busy in the United States, was capable of being moved to any point accessible to water transportation. This plant was built into a steel hull 318 feet long and 50 feet wide, with a maximum draft of 14 feet. Power is generated at 13,800 volts by a 30,000 kilowatt alternator driven by a 19-stage steam turbine.

U.S. Army Engineers built 433 railroad and 231 highway bridges and rehabilitated 14,357 miles of railroad track in Europe in the 11 months between D-Day and V-E Day. Included in the bridges were four rail spans across the Rhine River which are classified as permanent. The rail network extends from all major ports in France and Belgium into inner Germany. When hostilities ceased, the Army was operating six rail lines in Germany and seven others were under construction.

Air-ground. Regardless of the outcome of the struggle of the air component for independence either through a single defense department or in a new Air Department, the war demonstrated a multitude of methods by which some forms of aviation have become essential to efficient and successful ground operations. The larger aspects of strategic and tactical operations by Air Forces remains, of course, the "big punch" of air power, but there are many other ways by which aviation works intimately with the ground forces and helps get it forward.

Troop carrier operations in which conventional infantry and supporting arms are moved by transport planes, and parachute operations where trained paratroop men jump ready for combat, continue to be developed as specialized operations.

Air supply of ground troops permits operations in areas inaccessible to other forms of communication, as was so well demonstrated in the Burma campaign.

Air evacuation of wounded has been used in all theaters and undoubtedly has saved thousands of lives and avoided untold suffering by getting the men out of the danger area promptly and into safe, well equipped hospitals.

The use of small airplanes for spotting artillery fire has proved its worth and its use will continue and develop.

Thus regardless of the main impact of air power as an independent striking force, the uses of aviation in direct and intimate relationship with ground armies has shown marked increases.

Redeployment. The surrender of the German Armies on May 8 created the problem of military redeployment, to bring the greatest part of Allied strength to bear against Japan in the shortest possible time. This faced all of the major powers in varying degrees. England's problem was mostly naval. She did not plan to transfer any appreciable numbers of ground troops. Canada brought one infantry division with necessary ancillary troops from Europe to Canada. It was agreed that this division was to be re-equipped and retrained along United States lines and then to be sent to the Pacific to operate with U. S. forces. But the end of the war prevented completion of this project.

It was upon the United States forces with their 3,500,000 troops in Europe, that the greatest brunt of redeployment fell. The United States Army plan, which was put into effect when Germany collapsed and operated successfully until the surrender of Japan, called for the return of approximately 845,000 men, or slightly more than 280,000 a month, from Europe to the United States during the first three months after V-E Day. The second quarter was to have seen the return of 1,185,000, and the third quarter 807,000 men.

The United States was a huge staging area for the Pacific war, with retraining in progress and with immense stockpiles in western areas and even in East Coast port areas. Some troops, particularly specialized service units but also combat divisions, were redeployed directly from Europe to the Pa-

cific theater without stopping in the United States, but for most units plans called for redeployment by way of the United States.

When the Japanese indicated their desire to surrender, early in August, 2,760,000 men still remained in Europe, about 3,000,000 in the United States, and 2,000,000 in the Pacific. At this point the problem shifted from redeployment to demobilization.

Demobilization. After the fall of Germany the Army had put into effect a plan for the release of soldiers based on a "point system" in which men were given credits as follows:

One credit for each month in the Army since September 16, 1940.

One credit for each month served overseas.

Five credits for each of a list of specified decorations for combat service and for battle participation stars.

By the end of the year requirement for enlisted men's release was dropped to 37 points, officers' 44, and others proportionately.

As of Nov. 15, the composition and deployment of the vessels engaged in returning U.S. personnel to this country was as follows:

In the Atlantic:

80 U.S.-controlled troopships with total capacity of 242,489.

210 converted Liberty ships with total capacity of 115,000.

87 converted Victory ships with total capacity of 168,450.

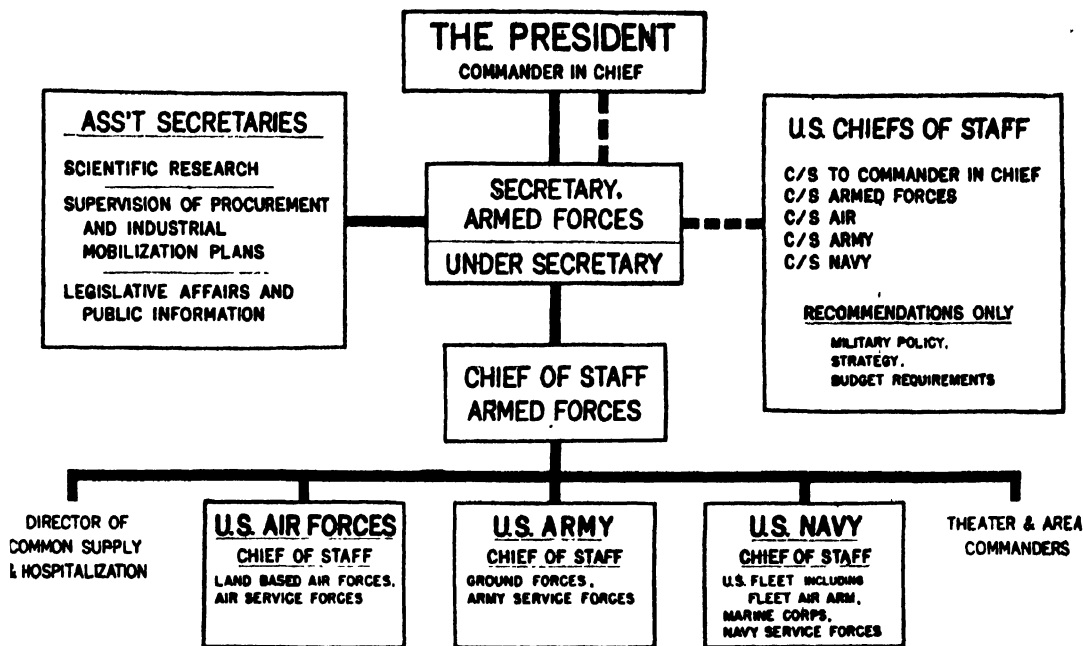

1 British ship (*Queen Mary*) with capacity of 11,400.

15 Navy carriers and other combatant vessels with total capacity of 36,212 (total lift assigned to Army).

7 Hospital ships with total capacity of 4,969 patients.

Total troop lift in the Atlantic—578,520.

Average turnaround per ship—five weeks.

THE WAR DEPARTMENT'S PLAN FOR A SINGLE ARMED FORCES DEPARTMENT

Twelve credits for each child under 18 years of age up to a limit of three children

A total of 85 points or less would qualify a man for discharge. The total score required for discharge was gradually reduced until by the end of the year only 50 was required for release of enlisted men and 70 for commissioned officers.

In the U.S. Navy, Marine Corps, and Coast Guard, no release score was set until after the Japanese capitulation, at which time the Marine Corps instituted a system granting points on the same basis as the Army and set 85 as the number required for discharge. The Navy set up a different system awarding credits to Navy and Coast Guard personnel on the following basis:

One-half point for each year of age

One-half point for each full month of active duty since September 1, 1939.

Ten points if the individual has a dependent.

Based on these points the Navy set up four critical scores for release:

- 44 for enlisted male personnel.
- 29 for enlisted WAVE personnel
- 49 for male officer personnel.
- 35 for WAVE officer personnel

In the Pacific:

178 U.S.-controlled troopships with capacity of 357,857

16 Army Hospital Ships with a lift of 11,418

178 Navy assault transports with a lift of about 264,352.

96 Navy combatant and other type vessels with capacity of 117,289.

8 Navy Hospital Ships with a lift of 7,088

Of total Navy lift of 388,729, Army assigned 152,200

Total troop lift in the Pacific—791,959.

Average turnaround per ship—ten weeks

The War Department announced the following target dates by which all American troops abroad would be returned to the United States.

a. In Europe and the Mediterranean: Withdrawal of all troops before the end of January, 1946, except for occupation forces and the minimum required to dispose of the Army's surplus property. Strength of the occupation army was set at 370,000. The close-out force of 300,000 will be released gradually, and will be home by the end of June.

b. In the Pacific and all other areas: Withdrawals to reduce forces to occupation and garrison complements in the Pacific (400,000) and elsewhere (100,000) will be complete by the end of

June. Shipping will not be a critical factor after mid-April.

Organization. With armed hostilities over and the period for demobilization of the vast forces begun, plans for the postwar military establishment were discussed. The War Department's plan was presented to the House Select Committee on Postwar Military policies substantially as follows:

1. A military establishment including the Regular Army, National Guard and the Organized Reserves—these three components to furnish the military units necessary for the initial mobilization for national defense in the event of emergency.
2. Universal military training.
3. An efficient and practicable means for industrial mobilization.
4. Adequate program of military research and development.

The Regular Army, according to the War Department's plan, should have peacetime functions as follows:

“First, it must keep informed of the war-making capabilities of all foreign nations;

"Second, it must furnish personnel to man our domestic garrisons and foreign stations;

"Third, it must be adequate to meet quickly a limited emergency which might arise before we can mobilize our citizen Army;

"Fourth, it must continue as the professional part of our military system to conduct the study and development of new arms, strategy and military technique, and,"

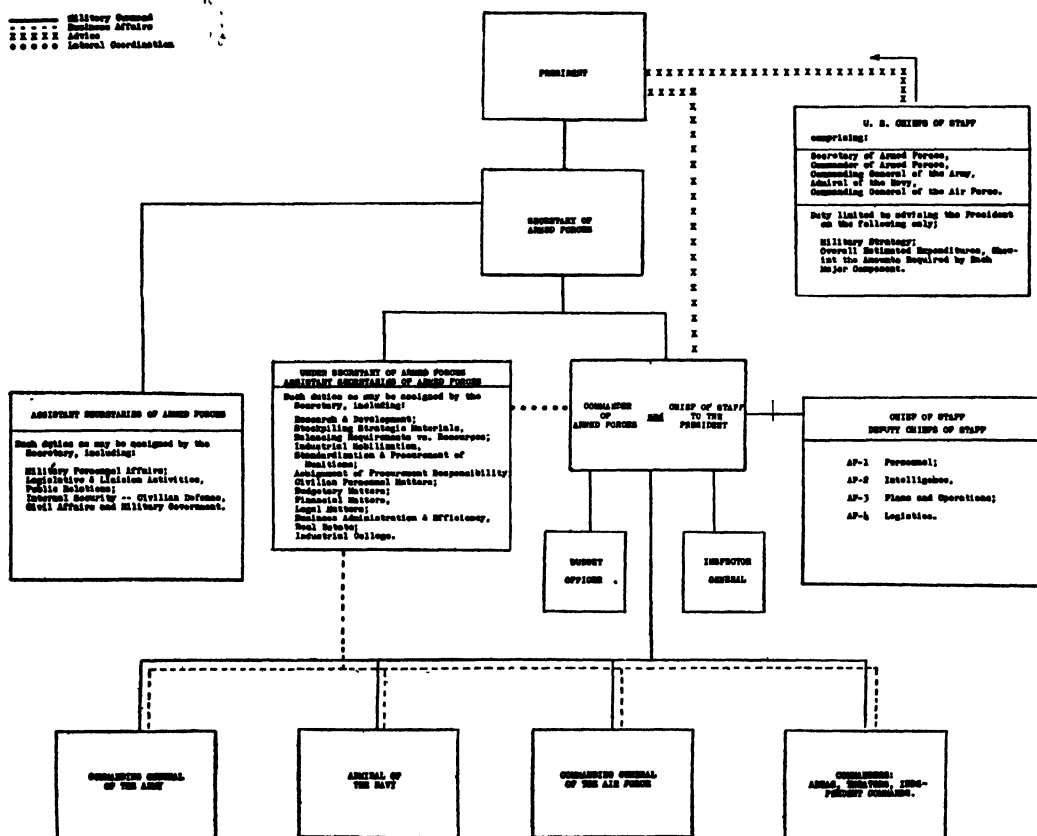

"Lastly, it must be responsible for the training

of our vast citizen forces to include the furnishing of administrative and supervisory overhead."

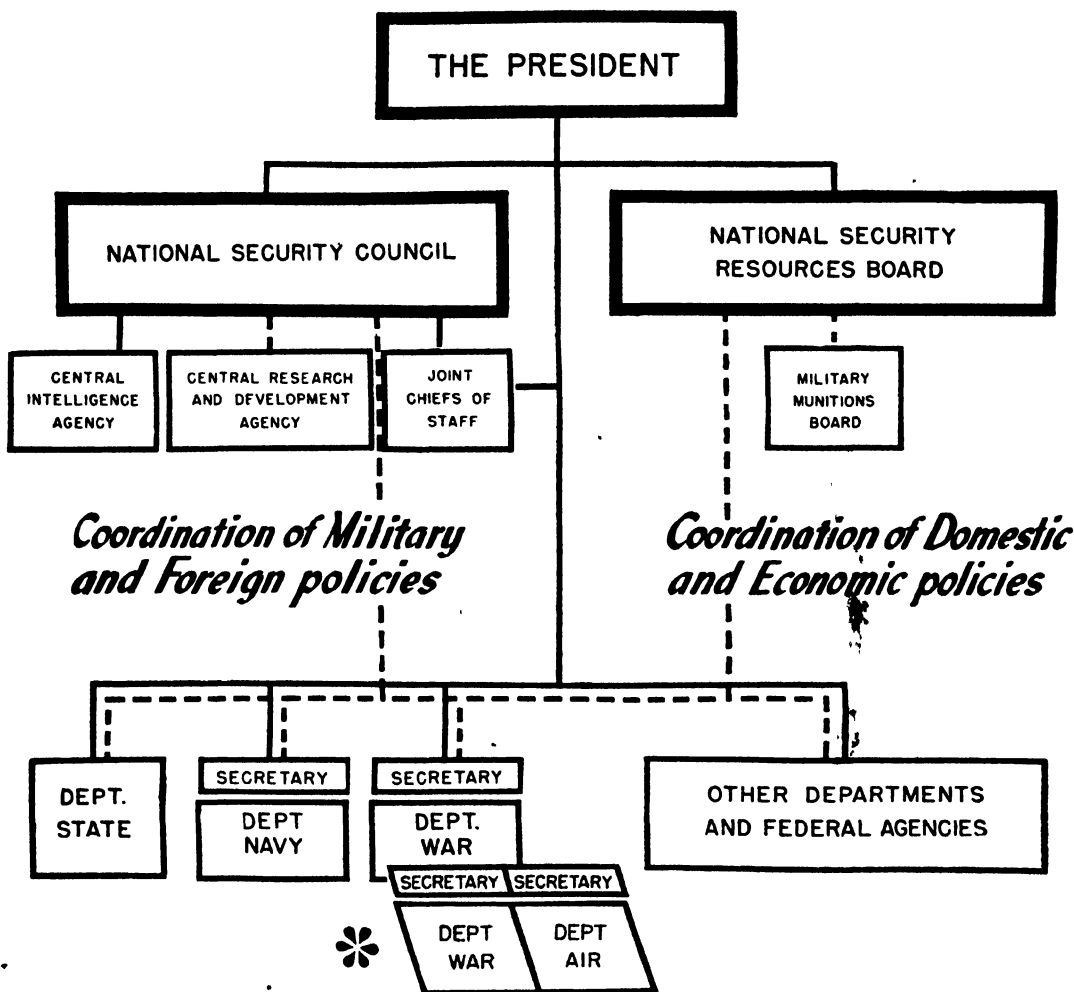

Simple Department. The movement toward greater unity in the administration and operation of the Armed Forces gathered momentum during the year, culminating Dec. 19 in a recommendation to Congress by President Truman that legislation be enacted consolidating the War and Navy Departments into a Department of National Defense.

The President asked Congress to reorganize the Armed Services along the following broad lines:

1. A single department charged with full responsibility for armed national security.
2. A civilian Secretary of National Defense with a civilian Under Secretary and several civilian Assistant Secretaries.
3. Three coordinated branches of the Department of National Defense; one for the land forces, one for the naval forces, and one for the air forces, each under an Assistant Secretary. The Navy should retain its own carrier-, ship-, and water-based aviation. The Marine Corps, too, should be continued as an integral part of the Navy.
4. The Under Secretary and the remaining Assistant Secretaries should be available for assignment to whatever duties the President and the Secretary may determine from time to time.
5. The President and the Secretary should be provided with ample authority to establish central coordinating and service organizations, both military and civilian.
6. There should be a chief of staff of the Department of National Defense. There should also

THE JOINT CHIEF OF STAFFS' PLAN FOR A SINGLE ARMED FORCES DEPARTMENT

THE NAVY DEPARTMENT'S PROPOSAL FOR A NATIONAL SECURITY SET-UP

be a commander for each of the three component branches—Army, Navy, and Air.

7. The chief of staff and the commanders of the three coordinate branches of the Department should together constitute an advisory body to the secretary of national defense and to the President. Key staff positions in the department should be filled with officers drawn from all the services, so that the thinking of the department would not be dominated by any one or two of the services. As an additional precaution, it would be wise if the post of chief of staff were rotated among the several services. The tenure of the individual officer designated to serve as chief of staff should be relatively short—two or three years.

The President listed his reasons for combining the two existing departments as follows:

1. We should have integrated strategic plans and a unified military program and budget.

2. We should realize the economies that can be achieved through unified control of supply and service functions.

3. We should adopt the organizational structure best suited to fostering coordination between the military and the remainder of the Government.

4. We should provide the strongest means for civilian control of the military.

5. We should organize to provide parity for air power.

6. We should establish the most advantageous framework for a unified system of training for combined operations of land, sea, and air.

7. We should allocate systematically our limited resources for scientific research.

8. We should have unity of command in outlying bases.

9. We should have consistent and equitable personnel policies.

In April a Special Committee for Reorganization of National Defense, appointed by the Joint Chiefs of Staff in 1944, submitted a report recommending that a single department system of organization of the Armed Forces be adopted. The report was signed by Rear Adm. M. F. Schoeffel, U.S.N., Maj. Gen. H. L. George, U.S.A., Maj. Gen. W. F. Tompkins, U.S.A., and Col. F. Trubee Davison, A.U.S. Adm. J. O. Richardson, U.S.N.-Ret., Senior Member of the Committee, dissenting from the majority views, submitted a minority report proposing that the Joint Chiefs of Staff organization be continued by statute and that study of reorganization and the advisability of a Joint Secretaryship be continued.

The majority report recommended an organiza-

tion which included a Secretary of Armed Forces, a Commander of Armed Forces, a Chief of Staff to the President, a Commanding General of the Army, an Admiral of the Navy, and a Commanding General of the Air Force.

In its report the majority said:

"The fundamental reason that unity of command in theaters of operations has not accomplished the necessary integration is that each component of the Army and Navy under a theater commander is actually part of a separate Department in the United States to which it owes its first allegiance and from which it derives different methods and techniques for accomplishing similar operational and supply purposes. Because of this, the theater commander's ability effectively and efficiently to carry out his command decisions is hampered by conditions over which he has little or no control.

"This is the situation after three years of war. It appears that about all the progress realizable through the existing cooperative system has been made. It is believed that much better teamwork in waging war would have resulted had the system herein proposed been in effect at the war's outset. If peace should find the Armed Forces still operating under the present system, with no wartime compulsion to get together, even the existing degree of cooperation can be expected to disappear. This situation will be aggravated by the forced readjustment to peacetime conditions. It is inconceivable that under these conditions an effective unity of command could be established in any area, because each of the forces under an area commander would look more and more to its own Department in Washington for directives on administration and supply, thus reducing the authority and prestige of the area commander."

In October the Senate Committee on Military Affairs opened hearings on proposals for the creation of a single department. First witnesses were Secretary of War Robert P. Patterson; General of the Army George C. Marshall, then Chief of Staff of the Army; and General of the Army Henry H. Arnold, Commanding General Army Air Force, all of whom endorsed the principle of a single department with the Air Force on a parity with the Army and Navy.

Subsequently a detailed organizational plan, drafted and sponsored by the War Department, was explained to the Committee by Lt. Gen. J. Lawton Collins, U.S.A., then Chief of Staff, Army Ground Forces. Gen. Collins said that the plan was designed to permit each of the Services to retain most of its present autonomy, with the Army Air Forces severing its ties to the present War Department and completing its independence. General Collins said:

"The United States Air Forces, Army and Navy are set up as autonomous members of our Armed Forces. Each would have its own Chief of Staff who would be responsible for the internal organization and conduct of his division of the Department and for the organization, development and training of the elements of the armed forces under his direction.

"The Air Force should include all land-based combat aircraft except those allotted to the Army and Navy for reconnaissance, spotting of gunfire, command and messenger service. The Air would retain its own service forces.

"The Army would include all combat ground forces other than the Marine Corps and would have its own service forces.

"The Navy would include the United States

Fleet with its air arm, the Marine Corps and its service forces."

The consolidation project was opposed before the Committee by Secretary of the Navy James Forrestal and by all Naval and Marine Corps officers who testified.

Secretary Forrestal favored the development of closer integration through the creation of a National Security Council, with the President as ex-officio chairman, composed of the Secretaries of State, War, Navy, and, possibly, a Secretary of Air. The Secretary urged further study by an independent board along the lines of the Morrow Board of 1925.

As the year ended, the Committee still had the proposal before it and, bolstered by the President's recommendations, was planning to take action early in 1946.

LEROY WHITMAN.

MINERALS AND METALS. The U.S. Bureau of Mines reports mineral production for 1944 climbed to a record total of \$8,543,000,000, 4.7 percent above 1943 and 21.1 higher than the prewar record established in 1920. Fuels—coal, natural gas, gasoline, petroleum and allied products—contributed the major share of this prodigious sum: \$5,254,000,000. New high marks were also set in pig iron and steel—pig and ferro-alloys reaching 62,866,198 tons, while our steel mills turned out 89,641,600.

[The different products of the mineral industry are described in separate articles.]

This unprecedented output was accomplished in spite of a 9 percent decline of the total labor force in the mineral industries from the already depleted supply in 1943. By working more days and longer hours the loss in man-hours was held to only 2 percent.

The gain was also in the face of a lack of price incentive: mineral prices were up but 23.2 percent from 1940 including premiums, whereas farm products advanced 82.1 percent and the level of all commodities 32.3.

Also, depletion barred increase in some products. For 60 years the nation has drained its resources, and compensating development lagged badly during the prolonged depression and the hectic activities of war. Add the handicaps of transportation controls, shortages of equipment, swollen costs, and the shut-down orders for gold and silver mines, and the magnitude of the achievement becomes clearer.

Consumption of many mineral commodities decreased from 1943, but new marks were set in some important fuels, in a few metals, and in fertilizers, giving probably a slight net gain in consumption. There was considerable relaxation of inventory and use controls, but some of this proved premature and had to be rescinded following the temporary reverses on the European front late in the year. Imports continued high, and though government stockpile objectives were reduced, inventories of many minerals mounted. Declines in industry stocks only partly affect these rises, so that the country's total mineral inventory showed a gain.

Draining off 11 million men into the armed forces, and concentration on certain "supercritical" activities produced many headaches for the mining industry. Its total labor force dropped steadily—835,183 men in 1941, 783,320 in 1943, 693,800 in 1944. The only answer was more and longer workdays for those who carried on: each employee worked 150 hours more in 1944 than in the pre-

ceding year; so, while total man-days were 7 percent lower, total man hours declined 2 percent.

Safety. The over-all safety record improved and was better than in any year since the start of complete statistics on mining and quarrying in 1930. Despite loss of skilled workers and pressure on the reduced force, with the fatigue of longer hours, there was a combined frequency rate of fatal and non-fatal injuries of 56.01 per million man-hours of exposure to hazards. Ten years before that rate was 78.81. Greatest improvement came in coal mining, while the quarry and coke industries had a higher rate than in 1943.

Strategic and Critical Materials. On Nov. 20, 1944, the Munitions Board approved the following definitions and lists:

1. The definition of strategic and critical materials is as follows: "Strategic and critical materials are those materials required for essential uses in a war emergency, the procurement of which in adequate quantities, quality, and time is sufficiently uncertain for any reason to require prior provision for the supply thereof."

2. Within the above definition, materials are listed either in group A, group B, or group C, according to the following provisions

(a) Group A comprises those strategic and critical materials for which stockpiling is deemed the only satisfactory means of insuring an adequate supply for a future emergency.

(b) Group B comprises additional strategic and critical materials, the stock-piling of which is practicable. The Army and Navy Munitions Board recommends their acquisition only to the extent they may be made available for transfer from government agencies because adequacy of supply can be insured either by stimulation of existing North American production or by partial or complete use of available substitutes.

(c) Group C comprises those strategic and critical materials which are not now recommended for permanent stock-piling because in each case difficulties of storage are sufficient to outweigh the advantages to be gained by this means of insuring adequate future supply.

3. Materials in group A may be acquired in the manner prescribed for group B. Materials in all three groups are subject to constant surveillance and review. Additions to, or deletions from, the list, or movement of materials between groups, may be made, based upon future changes in their strategic and critical status.

4. The conduct of a war requires the use of an encyclopedic list of semi-processed and processed materials, such as aviation gasoline, synthetic rubber, chemicals, drugs, ferroalloys, steel, light metals, etc. Elevation from peacetime production to a wartime footing will necessitate constant review of the facilities available to meet anticipated requirements.

GROUP A

Agar	Sapphire and ruby V
Antimony.	jewels.
Asbestos ¹	Watch and timekeeping
Rhodesian chrysotile	device jewels.
South African amosite	Kapok ²
Bauxite.	Kyanite. Indian
Beryl	Lead.

Scrap, iron and steel
Sesame oil²

¹ Require special storage conditions

² Require rotation of stocks

The minimum quantities of group A materials recommended for stockpiling were computed on the basis of certain strategic assumptions determined by the Joint Chiefs of Staff and the United States consumption (including military, Lend-Lease, and essential civilian requirements) during the peak year of the present war. In addition, the figures reflected the following considerations.

(a) Compensation for any known depletion of, or reasonably certain increases in, available resources in the United States;

(b) A similar compensation for known anticipated changes in resources of material outside the United States (as to which we have comparatively meager information at the present time);

(c) Adjustment for anticipated increases or decreases in future military requirements as the result of technological changes already evident;

(d) Adjustments wherever consumption data indicate that it has been necessary to use inferior grades of material in the present war; and

(e) Limitations imposed upon the stockpiles of perishable materials by reason of the necessity of rotating the quantities involved.

The maximum quantities of group A materials were determined on the basis of the following additional considerations needed to provide additional security.

(a) Supply from foreign sources as it may be affected in a future emergency by international political and economic conditions;

(b) The inordinate expenditures of manpower, equipment, and money which may be required to build up supplies of certain materials;

(c) Maintenance of an industrial economy at a higher level of efficiency than that prevailing during the current emergency by minimizing drastic dislocations resulting from critical shortages; and

(d) Requirements as they may be affected by the civilian needs of a population of the United States larger than the present population.

The report also emphasizes the need for constant review and revision of strategic and critical lists and stockpile objectives to reflect changes in technology and shifts in political and economic factors that affect the strategic status of raw materials.

The following suggestions as to future stockpile legislation were offered:

We recommend that the Congress adopt further stockpiling legislation in order to eliminate certain undesirable features of established policies relating to the procurement and release of materials for government stockpiling. In view of the substantial depletion of domestic resources

during the present war, statutory domestic preference requirements, allowing a year for deliveries from domestic production and the preference for domestic materials, as provided in the act of June 7, 1939, and the Buy American Act, respectively, are too restrictive. We believe that these requirements must be relaxed. Provision should also be made to permit the disposal of materials in stockpiles which have become obsolete, due to technological developments, as well as to permit rotation of those which are subject to deterioration.

We further emphasize that the acquisition of stockpiles in even the minimum quantities recommended in this report must be a gradual process, and will require periods ranging from 1 to 10 years, depending upon the material to be accumulated. This is because production of some of the materials in normal times is little beyond normal requirements of peacetime industry. In view of this fact, and the likelihood that in a future war we shall not have the time required to make the necessary provision for materials, it is important that an early beginning be made toward accomplishing a sound stockpile program.

Closely related to stock-piling are several other measures that should be given consideration in connection with any plan for the supply of strategic materials in war. On account of the direct bearing which these measures have on the kinds and quantities of materials that should be stockpiled, it seems appropriate to include them under these suggestions for future legislation. We refer to provisions for stand-by facilities, pilot-plant operations, continuous technological research, and the development of more economical processes for the utilization of domestic marginal resources.

In July, 1945, W. Stuart Symington became Chairman of the recently reorganized Surplus Property Disposal Board, charged, among other things, with the care, handling and disposition of stocks of metals, government owned processing plants, and transfer of surplus between government agencies.

MINES, Bureau of, U. S. Department of the Interior. As the only Government agency dedicated entirely to a more efficient conservation and utilization of American mineral resources through scientific investigation and research, the Bureau of Mines in 1945 explored mineral reserves, developed metallurgical processes, promoted health and safety programs, conducted investigations and research on coal, petroleum, synthetic liquid fuel, explosives, and other commodities, produced helium for war and peace, and performed economic and statistical services for all branches of the minerals industry. Work was carried on in field offices, research laboratories, and metallurgical stations in more than 60 important mining centers throughout the United States and Alaska.

America's success in the "war of metals and fuel" was aided to a great extent by the Bureau's wealth of "know how" in mining, manufacturing, and processing minerals, gained through three and a half decades of research and investigation. Added benefits were realized in the 1945 reconversion period as the Bureau continued to serve as consultant and adviser to industrial plants and to State and federal agencies. Peacetime operations will further utilize the fruits of Bureau technical developments and scientific research.

Mineral Exploration. As the United States and her allies demanded more and more mineral commodities in 1945, the Bureau of Mines increased its efforts to find new and better reserves of essential ores for war and replacement of war-depleted re-

MINERAL PRODUCTION BY STATES, 1944
(U. S. Bureau of Mines)

serves. By drilling, trenching and other types of exploration, the Bureau charted millions of tons of ore in new and known mineralized areas. New mines opened where drilling crews proved substantial reserves, and old mines reopened where ore bodies were extended in apparently exhausted known areas.

Examinations, geophysical surveys, and surface and subsurface exploratory work of the Bureau of Mines proved again that this country has reserves of minerals which formerly were imported, but that these reserves, with few exceptions, are generally of lower grade than the imported ones. The extensive exploratory program of the Bureau in 1945 covered the examination of 850 ore deposits and the conducting of 150 exploratory projects. Special attention was given to proving reserves of tungsten, vanadium, chromium, zircon, coking coal, fluorspar, mica, asbestos, optical calcite, crystalline quartz, and other critical minerals. Lead and zinc deposits were explored in a dozen States, to reveal the existence of reserves in Idaho, Illinois, Kansas, Nevada, and Oklahoma.

Millions of tons of usable iron ore were proven in Alaska, Arizona, Missouri, New Jersey, New York, Pennsylvania, Utah, and Virginia; results of investigations in Alabama revealed that high recoverables are possible from iron ore found in tailings; and 44 deposits of ferro-alloying minerals were investigated. Two important low-grade copper sources in Pima and Coconino Counties, Ariz., were confirmed by Bureau engineers. In the quest for domestic sources of tin, Bureau investigators diamond-drill tested a potentially valuable lode deposit on the Seward peninsula in Alaska. A low-grade mercury ore deposit in Napa County, Calif., was marked out by the Bureau and the metallic content was determined to run as high as 10,000 flasks of 76 pounds each. The development of domestic mica, as well as feldspar, beryl, tantalum, and lithium minerals, was materially aided in 1945 by exploratory investigations of pegmatites in six States. Reserves of bauxite, the chief ore of aluminum, were swelled to about 90 million tons, including all grades, by deposits proven through large-scale exploratory drilling in Alabama and Arkansas.

In the course of conducting hundreds of exploratory projects, the Bureau developed many technical refinements in diamond drilling, bulldozer trenching, and geophysical exploration, which greatly reduce operating costs and expedite the business of mineral discovery and proving.

Metallurgical Activities. Beyond the task of finding the mineral deposits, the Bureau of Mines is delegated to work out methods for making the minerals usable. To do this, it now has 12 metallurgical stations—pilot plants, small-scale test mills, furnaces, and other equipment—to demonstrate how, by modern milling and metallurgical processes, marginal and submarginal materials can be forced to relinquish their mineral treasures. Great strides were made in the development of new ways to convert complex and low-grade materials into high-grade metals and nonmetals to fit exacting specifications. The dependence of this country upon foreign sources of manganese was substantially lessened as a result of federal and cooperative investigations in the production by electrolytic methods. Ferro-alloys pilot plants at Rolla, Mo., and Redding, Calif., drew nearer completion and plans were concluded for a similar plant at Raleigh, N. C. The electrolytic chromium pilot plant at Boulder City was the scene of successful treatment of low-grade chromite from Montana. Important progress

was made in the hydraulic classification and flotation of Alabama iron ores. Beneficiated magnetite samples from Shasta, Calif., were separated magnetically at the sponge iron pilot plant in Laramie, Wyo., and the concentrates were reduced. Methods of reducing zircon in Oregon beach sands to zirconium metal were investigated at the Northwest Electrodevelopment Laboratory in Albany, Oregon. Extraction of alumina from low-grade bauxites, alunite, and clays was continued at several laboratories and pilot plants. Work on the reduction of copper, lead, and zinc at Salt Lake City showed considerable progress; and construction of a pilot plant at Rolla, Mo., for the reduction of zinc with methane was finished. Laboratory and pilot plant tests were made on fluorspar from domestic, Spanish, and Mexican varieties of materials stockpiled by the Metals Reserve Company. Sillimanite concentrate was shown by results of experiments made at the Electrotechnical Laboratory in Norris, Tenn., to be a satisfactory substitute for scarce kyanite in the manufacture of refractory brick.

Petroleum and Natural Gas. Military demands for aviation gasoline and lubricants, fuel for flame throwers and jet-propulsion planes, and an array of petroleum products for explosives, medicinals, and insecticides, placed added emphasis on the Bureau's research work in petroleum and natural gas. Studies on primary recovery methods were intensified in the Gulf Coast region, the Rocky Mountain fields, and in California. Analyses were made of more than 600 unconsolidated core samples, and the physical characteristics were determined. Bureau assistance to the petroleum industry also necessitated studies of secondary recovery methods, transportation and storage of natural gas, chemistry and refining processes, thermodynamics of crude petroleum and its products, testing condensate fields, recovery of wax, and the extraction of oil from mined rocks. The Bureau also inaugurated a research program on sulfur in petroleum. The results of these studies in 32 reports were made available to operating companies and federal agencies concerned with lubricants, fuels, and chemicals needed to win the war.

Helium. Although commercial demands for helium increased 65 percent in 1945, military demands declined and two of the Bureau's five plants were shut down. However, Army and Navy "E" stars went to the Amarillo and the Exell plants, and an "E" flag to the Otis plant in recognition of outstanding war production earlier in the year. Helium, separated from privately-owned natural gas being piped to market, was stored underground in the Government's Cliffside Gas Field. The United States Government is the world's sole commercial producer of helium gas, and the Bureau of Mines operates the Government's plants and conducts research in helium.

Research in Coal. The Bureau's many-sided program of coal research during the year stressed improvements in the preparation and up-grading of coal, better mining methods, and conservation through more effective utilization. Engineers and chemists sampled and analyzed more than 20,000 specimens as part of the Bureau's work of advising the industry and federal agencies on fuel and equipment specifications. Recommended changes in the use of fuels and equipment at a large number of Army camps saved thousands of tons of coal. Studies in methods of combating corrosion in Federal boiler plants brought better protection for approximately 300 million dollars worth of steel equipment. Bureau engineers cooperated with an-

thracite producers to find ways of preventing mine flooding and to develop safe methods of mining in thin, steeply-pitching anthracite beds. Methods of reducing the sulfur and ash content of coking coals were studied, and laboratory coking tests and petrographic examinations were made of 150 coals from this country, Chile, and China. The burning characteristics of emergency fuels were studied through analysis of more than 200 ash samples. Washability data, furnished by the Bureau of Mines, served as the basis for designs used by two Alabama companies. Investigations also were made on the storage properties of about 35 different coals. Supported by several thousand volunteer engineers and fuel experts and more than 13,000 co-operating industrial plants, the Bureau of Mines successfully continued its fuel-efficiency program during the year, designed to conserve fuel in plants, factories, hotels and other large installations.

Gas- and Dust-Explosion Research. To help prevent explosions which result from various dusts, powders, and vapor-air mixtures in coal mines and in industrial plants, the Bureau analyzed about 19,000 gas and dust samples, and formulated recommendations and safety codes for the guidance of industry in combatting such hazards.

Synthetic Liquid Fuel. As the Bureau of Mines' five-year synthetic liquid fuel program was shifted into high gear, three historic installations for producing gasoline and oil from coal, lignite, and oil shales were under construction. One of them, a coal research and development laboratory, was started at Bruceton, Pa., where fundamental research, process development, and engineering design work were being carried on by a staff of over 100 scientists in temporary quarters. A laboratory for research on oil shale was begun at Laramie, Wyo., and the third, an oil shale demonstration plant, showed progress in its construction at the Naval oil shale reserve near Rifle, Colo. Studies in the processing of marketable oil products from shale were carried on under temporary arrangements to advance the work while the Laramie and Rifle installations were being built. An oil-shale mine was opened near the Rifle plant for the dual purpose of developing low-cost mining methods and of supplying the plant with oil shale materials. The fourth major unit in the Bureau's five-year synthetic liquid fuels program—a demonstration plant for the production of gasoline and oil from coal and lignite—also came into being later in 1945 when the Bureau acquired from the War Department a \$17,500,000 synthetic ammonia plant known as the Missouri Ordnance Works, at Louisiana, Mo. This plant is to be converted into a demonstration plant for testing on a large scale the processes developed at the Bruceton, Pa., laboratory. Its acquisition will save the Government several million dollars in construction costs and is expected to speed up the federal synthetic liquid fuels research and demonstration program.

Explosives Research and Testing. Greater safety and efficiency in the manufacture and handling of explosives was promoted by the Bureau. In investigating explosives problems, more than 5,000 analyses and tests were made—including 419 chemical analyses, 2,717 gallery tests, and 2,029 other control tests. Five newly-tested permissible explosives brought the list of approved explosives to 178 items. An electronic chronoscope capable of measuring time intervals of one-millionth of a second was invented by Bureau explosives engineers. As a result of working agreements with the War and Navy Departments, the hazards involved in the storing and handling of military explosives and in-

cendiary materials were experimentally determined and a related study on the dangers associated with electrostatic ignition was begun.

Promotion of Health and Safety. Major health and safety activities in 1945 embodied accident-prevention training, safety education, accident investigation, testing of materials and equipment, coal-mine inspection and reporting, explosives control, cooperation with the military in preventing sabotage, and field and laboratory studies on the occurrence of gases, dust, extreme temperatures, and various conditions affecting the physical well-being of mine workers. Federal inspectors in the last fiscal year examined health and safety conditions and practices in more than 3,000 coal mines, assisted the mine-rescue work in virtually all major mine disasters, and investigated 31 mine explosions in 12 states, 52 mine fires in 20 states, and 132 miscellaneous accidents in 30 states. Safety engineers trained over 18,000 persons in first-aid and mine-rescue procedures, participated in the conduct of first-aid contests in five states, instructed mine workers and officials in about 1,200 complete accident-prevention courses and 600 partial courses, and attended 494 safety meetings in 29 states. To determine the permissibility of electrical equipment designed for use in mines, the Bureau conducted 1,327 explosion tests. Investigations also were continued on the operating safety of equipment intended for Naval use.

Mineral Production Security Program. Security engineers of the Bureau of Mines, in cooperation with personnel of the Army, Navy, FBI, and other organizations, acted on behalf of the Government in the prevention of subversive acts within the minerals industry. This function officially ended June 30, 1945. During the active half-year, anti-sabotage surveys were made at 36 operating facilities previously uninspected, and the reinspections made totaled 395 cases.

Explosives Control. Although the administration of the Federal Explosives Act tapered off after the war closed, recapitulation disclosed that the Bureau in 1945 issued about 90,000 licenses through 3,900 volunteer licensing agents, and inspected more than 16,000 explosives magazines through its staff of special investigators. Under the act, about 750,000 licenses were issued in the three-and-a-half years of operation, with only 56 of these having to be revoked, of which 14 were finally restored.

Economics of the Mineral Industry. In "feeling the pulse" of the industry while it underwent transactions in scores of mineral commodities, the Bureau's work in 1945 continued to grow in scope and importance. Operating on a daily basis, the Bureau supplied the armed services, emergency agencies, and "old line" Government departments with facts and figures of production, distribution, and consumption of all mineral commodities. Information on the sources of foreign minerals was gathered by members of the Bureau's staff of experts—some in foreign countries. Problems in the stockpiling of domestically-scarce minerals were analyzed by the Bureau's commodity specialists in cooperation with the military; and basic information required for the disposition of the surplus scrap problem was obtained through expansion of the Bureau's economics and statistics program.

Public Reports. To comply with requests for technical and scientific information on the multiplicity of minerals activities, which is needed by industry, war agencies, and the public generally, 660 essential reports were printed and distributed by the Bureau. Among them were bulletins, technical papers, Minerals Yearbook chapters, miners' circulars, re-

ports of investigations, information circulars, and many statistical reports issued periodically for industry. The Bureau of Mines library of selected reference material was enlarged by 2,351 books and pamphlets, 207 bound volumes of periodicals, and 247 issues of current periodicals. Loans of materials by the library amounted to 19,611 pieces drawn for special reading. Films depicting the latest mineral production techniques, advanced methods of mining and transportation, and faster and safer equipment were in constant demand for use by scientific and engineering societies, war-training and rehabilitation classes, educational institutions, civic organizations, and military centers at home and abroad. During the year, Bureau-sponsored films were exhibited before audiences totaling 8,000,000 people on about 85,000 occasions. Three new sound-motion pictures, "A Story of Copper," "Sand and Flame," and "A Story of Arc Welding," were placed in the Bureau's library of more than 10,000 reels which have been produced under the supervision of the Bureau of Mines in cooperation with and paid for by the mineral industry.

R. R. SAYERS.

MINT, Bureau of the. A Bureau of the U.S. Department of the Treasury which directs the coinage of money and supervises the activities of the three Mints (Philadelphia, Denver, and San Francisco), the two Assay Offices (New York and Seattle), the gold Bullion Depository at Fort Knox, Ky., and the silver Bullion Depository at West Point, N. Y. Director: Mrs. Nellie Tayloe Ross.

MONACO. A Mediterranean principality surrounded on its land sides by the French department of Alpes-Maritimes. Area, 370 acres; population (1939), 23,973. Chief towns: Monaco (capital), La Condamine, Monte Carlo. During peacetime the main sources of revenue were the tourist traffic and the gambling concession at Monte Carlo. Budget (1939): 38,892,921 francs (franc averaged \$0.0251 for 1939). A ministry assisted by a Council of State administers the country under the authority of the Prince. Legislative power rests with the Prince and the national council of 12 members elected by universal suffrage for a four-year term. Ruler: Prince Louis II (succeeded June 26, 1922).

MONGOLIA. An extensive, vaguely defined territory occupying the central section of China's northern border, fronting on central Siberia.

According to the Russo-Chinese Treaty signed in Moscow on Aug. 14, 1945, China officially recognized the "independence" of her former province of Outer Mongolia. The action constituted a reversal of China's traditional policy concerning Mongolia since Soviet influence became predominant in that region beginning in 1917. While Chinese authority over her former Mongolian subjects had been nullified by the Russian occupation, the Chinese National Government kept the record clear by frequent diplomatic declarations asserting China's sovereignty over these territories. The Soviet Government concurred in these Chinese declarations of sovereignty over Mongolia until 1941 when Russia and Japan entered into a non-aggression pact, whereby Japan recognized Russia's control of Mongolia and Russia recognized Japan's control of Manchuria. Now China and Russia recognize the independence of Mongolia.

It was from Mongolia that the world conqueror, Genghis Khan emerged in 1211 A.D. first to occupy Peking and north China and it was his grandson,

Kublai Khan who became the first Mongol Emperor and founded the Yuan Dynasty of China in 1259. On the north, Mongolia borders on Russian Siberia and on the south and southwest it borders the Chinese provinces of Sinkiang and Kansu. On the east is Manchuria, while the southern part or Inner Mongolia has been cut up into the Chinese provinces of Chahar, Suiyuan and Ningsia. Territorially, Mongolia is an enormous area of about 1,875,000 square miles or more than half that of the United States.

The terms "Inner" and "Outer" as applied to the northern and southern sections of Mongolia did not come into general use on Chinese maps until after Soviet Russia's occupation of the northern or more arid section of the territory shortly after the Soviet Revolution in 1917. However, Russian influence in Mongolia increased rapidly after 1912, when Chinese political and economic influence became weakened as a result of the collapse of the ancient Chinese Empire and the confusion incidental to the ushering in of the Chinese Republic.

Tannu Tuva. Located on the northwestern border of Outer Mongolia, to the west of Lake Baikal is a republic of some 64,000 square miles, which is now shown on the maps as Tannu Tuva. Prior to 1911 it was known as the Altai Province of Northern Mongolia. Since the old Chinese Empire had always maintained a strong garrison there because of its strategic importance, the population has a decided Chinese complexion and speaks a variation of the Chinese "Mandarin" or Peking dialect. The area is rich in oil, copper, gold, iron and asbestos.

Since Russian colonists had settled in Tannu Tuva as early as 1870, Imperial Russia laid claim to the territory. However, nothing was done to disturb the Chinese administration until 1917 when Outer Mongolia declared its independence of China. Tannu Tuva then became an independent republic and in 1924 became a Russian protectorate. It is now practically a part of the Ussinsk district of the Russian Altai Province of Siberia.

China's Influence Wanes. First serious opposition to Chinese rule in Mongolia came in 1911, at the time of the collapse of the Manchu Empire when the Mongols declared their independence of Peking. However, the Chinese were able to maintain officials in the capital at Urga and a semblance of authority in the country until 1917. In that year, the year of the Russian Revolution, Mongolia became fighting ground in the Russian civil war between the Bolshevik Armies and the White forces. During the civil war period in Russia a White General, Baron Ungern von Sternberg, known as the "Mad Baron" led a force of Whites and Japanese renegades into Urga, capital of Outer Mongolia, where he established his headquarters. The Chinese sent a division of troops under the command of Gen. Hsu Hsih-Cheng in an attempt to re-establish Chinese authority. His troops were waylaid on the Gobi Desert and defeated by Mongolian horsemen led by Red Russian officers. The Russian Soviet forces and the Mongols then surrounded and defeated the forces of Baron von Sternberg at Urga and killed the Baron.

Russian Reforms Introduced. With the collapse of White Russian resistance in eastern Siberia and the withdrawal of Allied troops from the Russian Far East, the Soviets came into complete control of Outer Mongolia and its capital, Urga, which was renamed Ulan Bator. In 1924, with Soviet assistance, there was created at Ulan Bator the "Mongolian People's Revolutionary Government," operated on Soviet lines. The stranglehold which the Llama priests had maintained over the people was

broken and there was created a Mongolian Parliament based on universal suffrage of both sexes over 18 years of age. The parliament, known as the "Great Huraldan" meets once a year and chooses from its members 30 representatives who serve on an executive committee, which in turn appoints five of its members to a board which administers the country. The army and air forces are staffed by Soviet Army officers. Finances are controlled by the Mongolbank, jointly owned and controlled by the Mongol administration and the Soviet State Bank in Moscow.

One-Party Government. The government generally follows the Soviet model with a one-party dictatorship closely affiliated with the Soviet Communist Party. Practically all commerce and the few industries are state controlled and operate in close agreement with the state monopolies of the U.S.S.R. The police system was organized by Soviet technical experts and follows Russian lines. The Mongol Government has always maintained a mission in Moscow. Much progress has been made in reducing illiteracy and in extending medical services. There has been a considerable influx of Russians into the country, the Russian population in 1932 being about one-sixth of the total which was estimated at 540,000. The Chinese population was approximately 5,000.

Considerable progress has been made in teaching the Mongols agriculture and modern stock-raising, but most of the people are still nomadic herdsman. The last census of animal population gave the country 1,340,000 horses, 270,000 camels, 1,500,000 oxen and 10,600,000 sheep. Chief exports are hides, wool and furs, all of which are sold to the Russian State Monopoly through Moscow. There is some mining of gold and other metals. There is close telegraphic, air, and radio communication with Russia, but all communication between Outer Mongolia and China has been severed for many years. Air service is maintained between Ulan Bator, the capital, and Irkutsk on Lake Baikal and with Verkhneudinsk. A railway was under construction to connect Ulan Bator and Chita but work was stopped due to the war. A bus line was operated for a time between the capital and the Trans-Siberian Railway at Ulan Ude on Lake Baikal.

Inner Mongolia. After Japan completed occupation of Manchuria in 1931-32 she moved westward into Inner or Southern Mongolia, which has been cut up into Chinese provinces and has a population ranging from 5,000,000 to 7,000,000 Chinese, mainly farmers. First, however, the Japanese consolidated their position in Jehol province, north of Peking. Using Jehol as a base the Japanese first moved into Chahar, then westward into Suuiyuan, and finally into Ningsia as far as the western terminus of the Peking-Suuiyuan Railway.

Meng-Chiang Created. On November 22, 1937 the Japanese announced the formation of the Mongol puppet state of Meng-Chiang, or "Federated Council of the Mongol Border Land." Embraced within the puppet Mongol State were the Federated League of Mongolia (capital at Hohoto); the autonomous government of Northern Shansi, with the capital at Tatung; and the Federated Government of northern Chahar with its capital at Kalgan, strategic city on the old Mongolian trails radiating northward from Peking. The total area was roughly 200,000 square miles.

Japanese Buffer State. The Japanese announced their intention of extending the State of Meng-Chiang westward into China's most western province of Sinkiang, the Japanese object being to set up a state, extending entirely across north-central

Asia, which would serve as a buffer, entirely cutting off direct contact between China and Russia. As a result of Japan's threatened move into Sinkiang which the Russians regarded as their "sphere," the Soviet authorities moved a considerable number of troops into Sinkiang, which had the result of holding up the Japanese western advance at the town of Powtow.

Chinese Reds Between. The Chinese Communist Government at Yen'an in northern Shensi was thus between the Russian and Japanese military zones and, due to its close territorial contact with Soviet-controlled Outer Mongolia, took on a position of great strategic importance. Since the Japanese capitulation the Chinese Communists have moved eastward and occupied Inner Mongolia, including the strategic city of Kalgan.

In 1937-1938 the Japanese Army in Manchukuo moved into the Nomonhan area between the western border of Manchukuo and Outer Mongolia. The area is strategically important as it is level land on the direct route to Ulan Bator, capital of Outer Mongolia, through which an invading army from Manchuria would have to pass in order to occupy Mongolia and penetrate the Lake Baikal district in the heart of Siberia. Severe fighting developed between the Japanese Kwantung Army and the Soviet-led Mongols which lasted for several weeks, resulting in some 18,000 Japanese casualties, caused chiefly by Russian heavy tanks and planes. After the Japanese had convinced themselves that the Russians were determined to defend Outer Mongolia, the Japanese decided to make peace and later entered into a non-aggression pact wherein Japan recognized Russian sovereignty in Outer Mongolia and Russia recognized Japanese sovereignty in Manchuria. The Russians abrogated this treaty early in 1945.

Religion of Lamaism. The religion of the Mongols (also Tibetans) is Lamaism, a mixture of Buddhism, Sivaism, and native Indian Shamanistic practices. The "Eight-fold path of Buddhism" which resembles the tenets of Christianity, is largely obscured in Lamaism by primitive Shamanism, which teaches the doctrine of an unseen world peopled by gods, demons, and ancestral spirits, all of whom are controlled by the priests and medicinemen. Siva, deity of Hinduism, is supposed to symbolize the principle of destruction. The head of Lamaism is the Grand or Dalai Lama, who resides in Lhasa, capital of Tibet. There is said to be a striking resemblance between the practices of Lama priests and those of some medicine-men of early American Indian tribes.

Russian Reforms. Among the reforms introduced by the Soviets in Outer Mongolia was the abolition of the Lama Priesthood Hierarchy, which had long exercised a dominating and repressive influence over the people. The Russians effected this reform by drafting all able-bodied priests into the new Mongolian Army to serve under Russian Buriat officers. The pay-off, so far as the Lama priests were concerned, was an order permitting all soldiers to marry and bring up families, a privilege previously denied the priests. Previously every family was compelled to turn over to the Lamas its first-born son for training for the priesthood in the large Lamasaries or monasteries. Since the priests were not permitted to marry, the practice had a restrictive effect on the population which almost resulted in the extermination of the Mongol race. All families with only one son soon disappeared and since the Mongols led the hard lives of herdsman, the families were normally small and dwindled rapidly. It was said that Lamaism was introduced

into Mongolia by the Manchu Dynasty in China as a means of controlling and restricting the fierce Mongol horsemen whom the Manchus were unable to conquer. The Lama religious hierarchy, being composed of "first sons" and naturally the best blood in the country soon came to exercise political as well as religious influence. When the Japanese invaded Inner Mongolia they were assisted by the Lama priests, the Japanese having assured them they would be "restored" to power as soon as Japan had conquered the country.

JOHN B. POWELL.

MOTION PICTURES. War's end had its influence on the moving pictures and on those who make them, but as yet no appreciable effect is noticeable in the type of films exhibited in the theaters. There are two main reasons for this: the end came suddenly and left the producers with a large backlog of pictures made in war time and reflecting the feelings proper to that time, films expressing the problems of peace and victory could not be prepared for release so soon after the enemy capitulation.

One of the most distinguished movies of the year, however, stems from the defeat of Germany. *The True Glory* is a remarkable and moving summing-up of the invasion of Europe by the Allies from the west and the south, and the successful campaign waged by them that ended the European phase of the war. It is a significant film both because of its contents and the brilliant way in which it is edited and presented. The original reelage out of which the picture was made ran, it is said, to about ten million feet of film photographed by British and American units in the field. Garson Kanin and Carol Reed had the tremendous job of cutting it down to the length of an average feature picture. So well did they accomplish their task that the whole range of the many battle fronts is comprehended and the parts integrated in a rhythm of sight and sound that brings home its theme of valor and teamwork with stunning impact. *The True Glory* is noteworthy not only in being a great documentation of a far-flung campaign, but even more so in being a rich, human study of the men of all grades, nationalities and races who made the campaign possible. The sound track carries a commentary by the fighting men themselves, speaking in their own voices, cultivated or coarse, foreign, American or British, officer or enlisted man. This device of vocal variety enriches the largeness of the film's design and gives it a human universality all too rarely met in a film of any kind.

Another film of great popularity growing in part out of the war's conclusion is *The House on 92nd Street*. It tells the story of the work of the FBI in its battle on enemy espionage. The picture had not been released before the struggle with Japan ended. Thus its makers were free to revolve the plot around Nazi attempts to steal the secret of the atomic bomb. Obviously this was an afterthought, but the advantage taken of it gave the picture, the first to mention the dreadful contrivance, a sharp timeliness. The film might be called a fictionalized documentary because, like *The Confessions of a Nazi Spy* released several years ago, the plot is built out of factual material in the files of the FBI. It includes footage photographed by FBI men in their counter-espionage; it uses a commentary modelled after those used in *The March of Time* series; and, besides parts taken by professional actors, many of the people who play in it are FBI agents. To its rousing, realistic melodrama *The House on 92nd Street* adds a instructive picture of the complicated machinery and scientific

methods employed by the Bureau in the detection of crime.

In the field of out-and-out fiction films the types have changed little in the number made from the films of 1944. In those inspired by the war there has been a falling off in the quantity that hang some phase of the training of personnel on a stereotyped plot. The war films that have been released are based on action in the fighting and several of them have been unusually good. For example, *Objective Burma* is the enactment of a single raid into Jap-held territory in preparation for the grand invasion. In it the influence of the many battle films is easily discernible, in its use of realism and played-down star roles.

Several books about the war that made some stir in the world of popular letters found themselves in movie renderings. Such were *A Bell for Adano* by John Hershey, *They Were Expendable* by William L. White, *A Walk in the Sun* by Harry Brown, *God Is My Co-Pilot* by Robert L. Scott and *The Story of GI Joe* by Ernie Pyle. All of them made films with some claim to distinction. Of these Pyle's *The Story of GI Joe* is perhaps the most remarkable. Taking the point of view of a war correspondent who was deeply sympathetic with the foot soldier in his ordeal, the film concentrates on the men themselves rather than on action in battle. It is one of the sincerest tributes to the fellow who fought the war in all its extremes of filth, pain and savagery. As a work of cinematic art it stands a good chance to become a classic of its type.

In the realm of biographical pictures the year made a mark for numbers if not for any particular fidelity to the lives celebrated. The producers made a stab at a variety of personages, ranging from Chopin to Dillinger, not forgetting a boudoir comedy built around the mature years of Catherine the Great of Russia. *A Song to Remember*, a highly romantic work in Technicolor, treats of the struggles of Frederic Chopin, trying to choose between his art and his patriotism. In the end both are served and even a parallel between his times and our own is hinted. The film's chief claim is a handsome presentation of a sizable part of the piano works of the ill-fated Polish master. Although he was not named in the screen credits of the film, Jose Iturbi played the Chopin numbers. In *The Rhapsody in Blue* the career of the late George Gershwin suffers from the same tendency to manufacture facts and incidents, where none exist, to fatten the story line. A rich and comprehensive use of his music is made, however, with Oscar Levant playing the piano parts. Both films had a wide popular appeal. Others such as *The Dolly Sisters*, *Incendiary Blonde*, a synthetic life of Texas Guinan, *Captain Eddie*, a bow to Eddie Rickenbacker, and *The Great John L.*, something of a preachment against intemperance, had plenty of local color of eras to which possibly time has lent nostalgic appeal. The educational value of such films might easily be questioned.

Serious treatment of social problems, both those that are the aftermath of the war as well as those constant to life in our civilization, has not been overlooked by the movie makers. One such picture is *The Lost Weekend*. It was inspired by Charles R. Jackson's novel of an alcoholic's extended bout with liquor. It made a most astonishing picture, shying at little in its clinical approach. To have attempted such a film was felt in some quarters to be rather a gamble. As it turned out, the movie not only proved artistically sound in structure, direction and casting, but met with strong popular

support in the theater. Ray Milland's acting won him the National Board of Review's citation of the best performance of the year by an actor. Other films attacking themes of social importance were *The Valley of Decision*, a tale of struggle between capital and labor in Pennsylvania's steel industry towards the end of the last century; *A Tree Grows in Brooklyn*, a picture of slum life and the urge in human nature to transcend it; *The Southerner*, a strong treatment of tenant farming in the south. The latter two, besides the interest to be found in their contents, are films of artistic integrity and deep human feeling.

In its growing sense of being a responsible influence for social good, the movie industry did not blink at the problems arising out of the position of the returning veteran. *A Medal for Benny* made a mordant comment on the exploitation of the war hero. *Pride of the Marines* searches into the problems facing men who return from the battle fronts physically and spiritually hurt. And the hero of *I'll Be Seeing You* is a soldier, the victim of battle fatigue, trying to recover his place in the world at peace. Sometimes stuttering in the effort to give form and voice to these themes, nevertheless the films offer much to provoke serious thought on problems that affect a large part of the nation.

The year's contributions to the thrill fans include a fine picturization of Robert Louis Stevenson's story *The Body Snatcher* in which medical history and horror are combined with nice judgment. Another is *The Isle of the Dead*, a macabre tale of plague and superstition, laid in Greece during the war for its independence in 1912. Both were made on a modest budget and successfully achieve their purpose. On a much more elaborate scale of production and high priced talent, Alfred Hitchcock made *Spellbound*. It combined with his famous flair for tense adventure a treatment of psychoanalysis as the means of resolving his plot. Ingrid Bergman, whose variety of talent is such that she played this year a nun in *The Bells of St. Mary's* and an adventuress in *Saratoga Trunk*, in *Spellbound* appears triumphantly as a lady psychiatrist. Along the same line of digging into the vagaries of the human psyche, a small but interesting film that came to the screen by way of the radio is based on a story by Arch Oboler originally called "Alter Ego." The movie is called *Bewitched*. Oboler, who directs the film, introduces into it radio techniques in sound that do much to increase the picture's power to produce thrills for those who like to be frightened.

In the happier vein of entertainment films, the public was treated to a variety of comedies and musicals. Among the more delightful of these may be placed *Anchors Aweigh*, a merry jape of sailors on shore leave, with songs by Frank Sinatra and dances by Gene Kelly, in a top-flight Technicolor production; *The Clock*, a charming romance of a corporal on his last leave in New York and the girl who shows him the town; and *Where Do We Go From Here?* a fantastic adventure of a 4F who wants to become a marine, and his troubles with a none-too-reliable genie who wants to grant him his wish. All told, the year did rather well in this genre without producing anything likely to make cinematic history.

The significant films from abroad still continue to be concerned with the war. Films from Sweden, fortunate in its neutrality, are the chief exception. They add character, humor and warmheartedness to a delight in the good things of their country. A good example of their product is *Goransson's Son*, based on the same plot used by Charles Chaplin in

The Kid. Elsewhere the war held the spotlight and inspired such films in England as *The Way Ahead*, *The Silver Fleet* and *Colonel Blimp*, and in Switzerland *The Last Chance* and *Marie-Louise*. All were distinguished productions, comparing favorably with the best of the year in the United States.

ARTHUR BEACH.

MOTORBOATING. This country's wartime restrictions were not lifted early enough in the year to permit the return of power boat championship racing, but a few miscellaneous events were held late last summer. Only competition of any importance staged was that at Culver, Ind., where Wally Harper of Detroit, national Runabout titleholder; Dennis Martin of Jackson, Mich., and Leon Guthrie of Cleveland dominated the field.

A unique regatta was put on by GI veterans on Lake Garda in Italy. Piloting American assault boats and captured German counterparts powered with U. S. outboard motors the soldiers bounced and swished over 4,000 wild meters to the delight of thousands of screaming spectators. The winners were T/4 Raymond Sherwood of Staten Island; T/4 Ross Ivy of El Campo, Texas; T/5 Arie Breashears of Mustang, Okla., and Pvt. Joseph Shucoski of Plymouth, Pa.

One speedboat mark fell during the year, Gunnar Feleij setting a new mark for 1,000 meters when he averaged 53.69 knots at Stockholm. The previous standard of 51.20 was made by Car Wood, Jr. in 1939.

THOMAS V. HANEY.

MOTOR VEHICLES. The bright glow of hope for resumed motor vehicle production in volume that extended throughout the automotive industry when the war ended faded into disappointment with the closing days of 1945. Although the year was marked by a flood of war materiel output there was little offered in civilian automobiles.

Weapons for the military surged off automotive assembly lines at \$1,000,000 an hour rates through the early part of the year, but the output of cars and motor trucks failed to approach more than a trickle in the second half of last year.

The automotive industry's military production record stood out brightly, as motor companies in the aggregate were responsible for approximately one-fourth the nation's metallic war supplies.

The year also saw the automotive industry leading the campaign for adequate national plans for reconversion. The government freeze on reconversion planning, which set in at the times of Allied reverses during the Battle of the Bulge early in the winter, began to moderate by Spring. In April, top War Production Board officials met in Detroit with automotive manufacturers and their joint discussions laid the foundation for a series of government orders in ensuing weeks allowing pre-reconversion steps governing tooling, materials and plant construction.

In May, the Government established quotas under which the industry was granted permission to manufacture slightly less than 250,000 passenger cars in the last two quarters of the year, provided materials could be obtained and plant space freed without interfering with the war effort. Within the confines of the government policies, one manufacturer was able to get into limited production on July 3, while another manufacturer got underway late in August, but strikes soon shut off output at both companies. No substantial production was attained by any passenger car company in the year, even with the lifting of government quotas after

V-J Day, as strikes and shortages provided formidable obstacles to steady output.

Civilian motor truck production did somewhat better, as the physical reconversion problem in this branch of the industry was less severe, and as governmental authorizations had been granted earlier than in the passenger car field. Production fell short of the estimated potentials, however.

The automotive industry's total war and civilian output in the year amounted to \$6,500,000,000 of which 83 percent was for the military.

Despite war contract cutbacks and cancellations, most automotive companies were busily engaged in military production until Japan capitulated in August. One automotive company was favorably cited by the Secretary of War for its work on the atomic bomb project, while others had underway development work on propulsion, radar-controlled projectiles and other experimental projects. The industry was the chief source of supply for military vehicles and tanks, and was a considerable factor in the aircraft production picture, furnishing more than some eleven billion dollars of completed planes, aircraft sub-assemblies and engines during the war.

When the final records were compiled, it was found that the automotive industry had provided the United States and its Allies with a total production of \$28,970,000,000 in war materials since the beginning of the conflict. This included 2,600,000 military vehicles, 21,835 complete planes, 191,160 tanks, armored cars and other combat vehicles, 745,980 engines other than for military vehicles and 5,830,980 guns and artillery pieces.

With the end of the war, automotive companies tackled their reconversion problems with speed and vigor. Moving out government-owned tools and war materials, they swiftly rearranged plants for civilian production. Production blueprints, layout charts and process sheets had long been in preparation, so that every man assigned to automotive reconversion work knew exactly what to do. The manufacture of parts needed for passenger cars got under way in hundreds of plants throughout the nation, taking up the slack in unemployment that set in when war contracts were cancelled in wholesale fashion after V-J Day.

The civilian production curve was unsteady, however, throughout the second half of the year. A prolonged strike at the Kelsey Hayes plant in Detroit, resulting from protests of a small group of workers over a War Labor Board award upholding the discharge of three men, choked off the flow of essential parts needed by the Ford Motor Company. This strike so seriously held back output that it was almost autumn before the company could send each dealer a car, even though the company had gotten under way early in July. Hudson Motor Car Company was similarly affected by a strike of plant foremen, which greatly minimized the advantage the company had enjoyed in getting out its first cars before Labor Day. A twelve week strike at the Borg-Warner plant in Muncie, Indiana, deprived Studebaker, Willys-Overland and other companies of transmission gears, and brought their assembly lines to a standstill. Strikes in ball bearing and other supplier plants developed frequent shortages, keeping daily production at car and motor truck plants on a hit-or-miss basis through the fall months. In late October the strike at Libby-Owens-Ford and Pittsburgh Plate Glass Company, the two major glass producers, also seriously affected automobile production.

Though materials generally were available in quantities sufficient to keep up with the sparse

production, shortages developed from time to time, particularly in textiles, tin, castings and parts. At no time was the industry completely free of worries over scarce supplies.

As late as mid-October, Packard Motor Company reported that its new car bodies were lacking as many as nine parts. After overcoming these obstacles to production, the company finally was forced to close down in mid-December because of other shortages, these brought on, however, by supplier strikes.

Center of national attention during the latter part of the year was the strike at General Motors Corporation, first target of the United Automobile Workers (CIO) in the union's drive for a 30 percent wage increase. The union's policy, as announced at the UAW executive committee meeting in Flint in September, was to concentrate its strength against one automobile company at a time until its demands were met. In the meantime, the union avowed it would make every effort to keep competitor companies operating, to put the affected company at further disadvantage. Shortly after the Flint meeting Walter Reuther, UAW Vice President, announced that General Motors, largest company in the industry, was to be tackled first in the 30 percent wage drive.

The union called all its members out on strike on Nov. 21 completely eliminating for the remainder of the year any further production at the Chevrolet, Cadillac, Buick, Oldsmobile and Pontiac passenger car plants, all General Motors motor truck and bus manufacturing lines and General Motors parts divisions.

President Truman appointed a three man fact finding panel to look into the controversy, and hearings got under way in Washington in mid-December. General Motors withdrew from the hearings a few days after Christmas. General Motors and the union meanwhile had resumed negotiations, with the company offering a 13½-cent an hour wage increase on Dec. 7 which the union rejected. Negotiations were continuing as the year ended.

Another feature of labor-management bargaining was the demand by the Ford Motor Company of "company security" as a principle to be incorporated in its contract with the union. As the negotiations proceeded, Richard T. Leonard, head of UAW Ford division, indicated willingness of the union to have the company discharge strike leaders responsible for "wildcat" strikes and to fine other participants in such work stoppages. Bargaining over the extent of the wage increase to be granted went unresolved after the union turned down a proposed wage boost of 12.4 percent. Chrysler, too, was in the midst of union negotiations over the 30 percent demand, but without public limelight being focused to any extent on the deliberations.

In contrast to industry estimates cast shortly after V-J Day indicating a production of 500,000 passenger cars by the year's end, actually only 75,000 cars were produced, an average of 2.2 cars per dealer in the United States. During the year, 315,000 civilian motor trucks were manufactured and 16,500 buses.

All passenger car companies in the field when production was suspended on government order Feb. 10, 1942, were competing in the automobile industry in 1945. In addition, a newcomer, the Kaiser-Frazer Company, was getting ready to compete, having been formed in July for this purpose. The Willow Run plant rented from the Government, was announced as the scene of their future production efforts.

All cars shown publicly in 1945 bore close resemblance to the 1942 models, last to be produced before the war. Wartime restrictions on materials and on tooling and engineering work allowed little opportunity for radical changes in design.

Only 25,350,000 passenger cars were registered in 1945, a drop of over 4,100,000 from 1941 and 220,000 less than the figure for 1944.

Registration of motor trucks increased slightly in 1945 over 1944 but was lower than the 1941 figure. In 1945, 4,650,000 trucks were registered compared to 4,513,340 in 1944 and 4,876,054 in 1941.

Total motor user taxes showed a considerable decline since 1941. In 1945 taxes amounted to \$1,870,000,000, whereas in 1941 taxes were about \$2,150,000,000, another indication of the civilian motor vehicle supply. The figure for 1945 includes \$578,000,000 in special motor truck taxes, an increase of \$25,000,000 over the figure for 1941.

Meanwhile there was coordinated effort by the automotive industry, safety groups and highway planning groups to rush programs to make way for any new cars that might be produced and the flood of travel released by lifting the ban on gasoline. The American Association of Motor Vehicles Administrators, the Automotive Safety Foundation, National Safety Council, American Automobile Association and American Road Builders Association took active parts in this movement.

The American Association of Motor Vehicle Administrators, composed of State enforcement and highway officials from many sections of the country, urged that universal pedestrian control was much needed in cities while the rapid rehabilitation of millions of miles of routes in this country was stressed.

Late in the fall it was announced that the annual 500-miles Memorial Day race would be resumed at Indianapolis in 1946 after being suspended for the wartime duration. Capt. E. V. Rickenbacker, who began his colorful career as a race driver, termed this contest a motor vehicle test laboratory.

"All of the new automotive principles developed during World War II will see their counterparts on the Speedway before going into the car delivered to the public," he said. "The facts learned at the Indianapolis course and other tracks under American Automobile Association auspices will point the way for future trends in automobiles."

The tangible hope for new cars in the near future caused no abatement in the demand for used vehicles and it was forecast that this market would hold steady throughout 1946.

With more than 4,000,000 passenger units off the highways since 1941 there was a wide-spread demand for replacement. Used cars in good condition were eagerly sought, especially those in the low and medium price brackets. By the end of 1945 the supply of the vehicles in the latter classifications had dwindled to fractional proportions of the number demanded.

Of the 41,790 automobile dealers in business at the time of Pearl Harbor, 33,000 still were operating at the close of the war. After V-J Day there were thousands of applications received by virtually all companies for dealerships.

In analyzing the improvements which have been designed for new automobile production the Society of Automotive Engineers in member findings stressed the uses of synthetic rubber developed to meet wartime needs.

The results indicated that a wide scope of requirements can be met by this material for passenger automobiles, trucks and buses.

The reason for this confidence, in the opinion of a number of members of the society, was that the chemist can compound into the synthetic product the mechanical and physical characteristics he desires, whereas natural rubber has established specified limitations which, as yet, cannot be altered.

The general condition of the average car now in service was established by a nationwide survey conducted by the *New York Times* in August. More than 70 percent of those who replied emphasized urgent need for tire replacement. While 31 percent sought new cars immediately and 18 percent specified 1946 models with 25 percent content to await arrival of the 1947 models, the rest signified their intention to retain their present transport units to dates extending up to 1950.

In summarizing the immediate future of the automotive industry, based upon estimates late in the present year, it was pointed out that achievement of large scale production would make possible the employment of 569,000 workers in automobile manufacturing alone, aside from parts and accessory work, by June of 1946. These figures were calculated from a survey in November by the Civilian Production Administration. This would be only slightly below the first quarter of 1945, when war production was in full swing, and double the 1939 peacetime level.

BERT PIERCE.

MUNITIONS ASSIGNMENTS BOARD—United States and Great Britain. Created by the President of the United States and the Prime Minister of Great Britain on Jan. 26, 1942. The U.S. Section, working in close collaboration with the corresponding London organization, maintains full information of the entire munitions resources of Great Britain and the United States. Its duties relate to the assignment of munitions and the balancing of resources against stated requirements. Executive: John Y. York, Jr.

MUSIC. The signing of the peace was accompanied by few perceptible changes in the progress of musical life, other than the rituals that came in the normal course of events—e.g. a Toscanini Victory broadcast and similar tributes in fall orchestral programs and Prokofiev's *Ode on the End of War*. There was no decline in the number of recitals that had been encouraged during the war by increased financial resources for non-profit activities and increased public demand for entertainment. A serious problem, however, was that of artists abroad who were anxious to return here. As yet there was no one for Wagnerian roles to replace Kirsten Flagstad, the Norwegian soprano, who made every attempt to prove herself innocent of Quisling affiliations. Speculation as to her usefulness to opera at her age, or the possibility of her superb artistry extenuating for her politics, were brought to an end when her husband was officially put on the Washington list of those who would be refused entrance.

Creative Activity. Several substantial new compositions came out during the year, but no one of them asserted itself above the rest in the spectacular way that a new Shostakovich symphony might have done had one arrived. If they made no such onslaught upon public consciousness, it was not because of any less intrinsic worth. The Fifth Symphony of Serge Prokofiev (premiered by the Boston Symphony under Serge Koussevitzky) was received with mixed feelings partly because its inwardness is of a kind that does not transmit itself immediately over the footlights. Also, despite a few great inspirations in the work, one suspected that per-

haps the composer was not quite at home in the form of the symphony when he composed the work. The work was composed in a glassed-in verandah in Ivanoco, overlooking a pond where village kids swim and the gigantic farm which houses on its grounds some twenty composers every summer. After work these composers criticize one another's accomplishments, and on one occasion of their interchange of opinion, they advised Prokofieff that since he had not essayed the symphonic form for fifteen years, it was time he did something about it. Thus, a Fifth Symphony.

Among Americans, Aaron Copland received well deserved recognition for his score to Martha Graham's *Appalachian Spring*. The score won the Pulitzer Prize and the award of the New York Music Critics Circle. Several major orchestras included this lucid work on their opening programs of the fall season. Walter Piston also received his due for his Second Symphony, which won the Circle's prize in the symphonic category.

From Russia came reports of the première of the Shostakovich Ninth Symphony, which the composer had projected as a large work completing (with the Seventh and Eighth) a trilogy of the war. But the shadow of Beethoven's Ninth hung over him, and instead of attempting to compete with its seriousness, he wrote a relatively light work, less than a half-hour in length (as compared with the preceding works of well over an hour in length). Shostakovich regards this work as an interlude in the trilogy, rather than as its culminating section for which it had been planned.

Other reports from abroad related to the success of the large-scale opera (a rarity for our time) *Peter Grimes* by the young Englishman, Benjamin Britten. In France, Olivier Messiaen, a strongly mystic composer who had been a Nazi prisoner, was the rising star.

The eightieth birthday of Jan Sibelius called for concert celebrations, one of which, in Carnegie Hall, raised funds to be sent to him in Finland to distribute among young victims of the invasion, who were very much a concern to him. Through quirks of the copyright law and international difficulties created by the war, his many American performances yielded no return, and with internal difficulties what they were, he suffered considerable deprivation, it was revealed. Individual gifts from orchestras here, which had performed his works, helped alleviate this condition. Also among anniversaries, in this case of a composer no longer living, was the hundredth of the birth of Gabriel Fauré, marked by a festival at Harvard University, under the direction of the noted French pedagogue of composition, Nadia Boulanger.

A jolt to the conservative music world was the appointment of young William Schuman to the responsible position of president of the Juilliard School of Music. A composer in an idiom that many consider radical, he had entered music originally by way of Tin Pan Alley. In his music, boyish exuberance alternates with imposing seriousness, and in both veins he is closer to the *avant-garde* than anyone would expect to find at the head of a relatively old-guard institution. Judiciously, he did not bring about any radical change in 1945, but symptoms of his new position could be discerned in the festival of three concerts of Paul Hindemith's works presented in fitting recognition of this composer's fiftieth birthday, with the composer himself participating in the festivities.

The death, in the outskirts of New York City, of Béla Bartók, Hungary's leading composer, on Sept. 26, was a profound loss to the musical world.

Two other celebrated musical figures passed away: Pietro Mascagni (Rome, Aug. 2) and Jerome Kern (New York, Nov. 11).

Composers who figured prominently on orchestral programs included Igor Stravinsky, Darius Milhaud, Virgil Thomson, Randall Thompson, and, especially upon his visit from Brazil early in 1945, Heitor Villa-Lobos. Recipients of Guggenheim Fellowships in composition were Lukas Foss, Norman Dello Joio, Nicolas Lopatnikoff, Arthur Kreutz, Dai-Keong Lee, Samuel Barber, Elliott Carter, and Charles Faulkner Bryan.

George Antheil, who had made the front pages in the 'twenties with his *Ballet Mecanique* (a work imitating machine noises, and enlisting sixteen pianos in addition to the orchestra in its Carnegie Hall performance), attempted a come-back with a Fourth Symphony and other works in the offing, in a more sober vein, more in line with the massive Shostakovich vein with its war implications. Howard Hanson in the spring celebrated the 20th anniversary of the American Composers Concerts at the Eastman School of Music of the University of Rochester, in the course of which he has conducted some 900 orchestral works by 400 composers.

Orchestras and Conductors. A precarious matter in the relationship of composers and orchestras, that of performing fees, received attention at last. ASCAP, which has added many "serious" composers to its nucleus from the "popular" field, issued blanket licenses to 16 major symphony orchestras, giving them the privilege, for a lump sum each year, to perform anything in the ASCAP catalogue. A similar contract was signed by the American Composers Alliance and the Philharmonic-Symphony, and other orchestras were negotiating such contracts with ACA.

Symphony societies moved in other directions as well to aid the American composer and contemporary composers in general. There were, for example, the commissions, such as those set up by the Cleveland Orchestra and the Koussevitzky Foundation. A more spectacular gesture was that of the Detroit Symphony Orchestra, whose president, Henry H. Reichold, established a \$32,500 contest for the *Symphony of the Americas*. Composers throughout the Western Hemisphere have been invited to compete for this Reichold Music Award, with its first prize of \$25,000. (The nearest to a precedent for this was the RCA-Victor contest in 1929, but at that time, when the judges could not decide on any one person for a prize of this amount, it was split up among five finalists.)

An English commentator of musical events remarked on the increase in orchestral concerts as opposed to other musical events, not only in England, but in other parts of the world as well. For Great Britain, however, this was a serious matter, since it spelt the decline of the choral traditions which had hitherto been greater in England than anywhere else. New York felt the increase in orchestral music in a very apparent way. With the visit of the Detroit Symphony in January, and that of the Rochester Symphony in March, New York could chalk up the score of 6 visiting orchestras and two resident ones for the season 1944-'45. In addition to the two regular visitors (the Boston and Philadelphia) and the two new ones mentioned, there had been, earlier in the season, the orchestras of Washington, D.C., and Indianapolis. The resident orchestras included the long established Philharmonic-Symphony, in its 104th season, and the young New York City Symphony, in its second season. Established by Stokowski in 1944 under the aegis of the City Center of Music and Drama, the

City Symphony, in the fall of 1945, fell into the hands of young Leonard Bernstein who succeeded Stokowski (likewise contributing his services), when the latter was obsessed once again by his characteristic wanderlust and set out on a conducting tour of South America. Bernstein, with his talent for making headlines, attracted attention when he attacked the city for taking credit for the City Center without actually supporting it.

Opera. Statistics at the close of the 1944-'45 season of the Metropolitan Opera Association revealed that Mozart, with only three operas in the repertory, had been represented as many times during the season as Wagner with seven operas—namely, 18 times. Verdi with four popular operas, fell below this number. Among the season's memorable revivals were those of Beethoven's *Fidelio* (in English) and Wagner's *Die Meistersinger*. A poor English translation was partly responsible for the failure of the revival of Rimsky-Korsakoff's *The Golden Cockerel*.

Evening gowns, top hats, white ties became the norm again as the season opened in November, 1945. Another notable feature of the season was the fact that the Wagner cycle of the uncut *Ring of the Nibelung*, by now an annual ritual, was not being planned. The reason seemed to be that Lauritz Melchior, at 55 still the champion *Heldentenor*, would not make any blanket agreement to commit himself in advance to the company for any protracted period of time. He wanted to be free to come and go, and exploit further the success he had achieved in Hollywood.

For the more lyrical roles, like Lohengrin, Torsten Ralf was imported from Stockholm by the Metropolitan to relieve Melchior of these. Among artists returning from abroad to the company were Jussi Björling, who could not get back owing to wartime conditions, and Arthur Kent, baritone, who, in 1942, had been the first member of the Metropolitan Opera to serve in the armed forces. Noted with pleasure was the company's engagement of Dorothy Kirsten, soprano, who made her debut in the large opera house in *La Bohème*. Adding to the imposing list of conductors, who were so largely responsible for the improvement of the company in the last few years, the Metropolitan Opera Association invited Fritz Busch to join its roster. He had been musical director of the Glyndebourne Mozart Opera Festivals in England. The first of the season's revivals was Gounod's *Romeo et Juliette*, last given at the Metropolitan in 1938.

Recitalists. Pianists were particularly abundant, vying for favor in America's concert halls. In New York's three major concert auditoriums, about ten a week could be relied upon. Recitalists in general became so numerous that new concert hours had to be instituted to accommodate them in New York's downtown halls. In addition to the 5:30 hour on weekends, by now a usual thing, 11 A.M. and 11:30 P.M. were attempted one week in November.

By 1945 people seemed no longer surprised at the transgression of so-called "serious" artists upon the more widely publicized domains of cinema or popular music, or conversely, the appearance of night-club artists in the sanctums of the concert halls. The great Polish pianist, Artur Schnabel, earned \$85,000 for three days of work, performing Rachmaninoff's *Second Concerto* and some other works for the film, *Concerto*. (The fee is said to have been a record one for any Hollywood performer, musical or otherwise.) On the other side of the ledger was the appearance of Hazel Scott in Carnegie Hall and similar auditoriums in the

country. The celebrated colored night-club pianist not only played her usual swing arrangements and boogie-woogie, but devoted the first part of her program to works of Bach, Scarlatti, Chopin and others, in the original. Though she understood the "classics" better than one might expect of a swing-artist, she showed herself to have made no mistake in choosing swing as her major life-pursuit. On her tour she encountered the inevitable refusal from the D.A.R.'s Constitution Hall. Her Congressman husband requested Mrs. Truman, in protest, not to attend a D.A.R. function scheduled just after the refusal, but the First Lady did not think this the proper way to deal with the situation. Later, the American Guild of Musical Artists threatened that its entire membership would boycott the hall, unless Hazel Scott were granted a date there.

A good deal of publicity preceded Maggie Teyte's arrival. The somewhat special segment of music-lovers who collect French songs, looked forward to the British soprano as to an old friend. A cult quickly formed, and several recitals, no sooner announced, were sold out. Some loyal souls followed her from New York to Philadelphia or Washington, D.C., when she made her concert tour. Having coached with Debussy, she had undeniable insights into his style, but as in the case of any cult, there were those who found perfection in everything—which was scarcely to be expected from a voice first heard in its debut 40 years ago.

Recorded Music. The decision of the War Production Board to relax the restrictions on the sale of shellac resulted in a speed-up in the manufacturing activity of the recording companies which had been geared for action ever since the repeal (winter, 1944) of the Petrillo ban. By fall, 1945, the number of new releases per month returned to normal. In the meantime, RCA-Victor surprised the public with a new process of pressing records. This was in October when *Vinylite* made its debut. This is a red, transparent substance out of which records are made. It was introduced as "non-breakable under normal use" and allowing for a reduction in surface noise. The first album on these discs was *Till Eulenspiegel*, recorded by the Boston Symphony under the direction of Serge Koussevitzky. This new method was restricted to certain "de luxe," higher-priced albums, which would later be issued on regular wax discs at normal prices.

Musicography and Music Criticism. Paul Henry Lang, author of *Music in Western Civilization*, was appointed editor of the *Musical Quarterly*, succeeding Carl Engel, who died in 1944. In 1945, the musical world mourned the loss of three long-established figures in the world of music criticism: Oscar Thompson, music critic of the New York Sun; Leonard Lieblich, editor of *The Musical Courier*, and Pierre Key, editor of *Musical Digest*. Donald Francis Tovey's book on Beethoven was brought out posthumously by Hubert J. Foss, who edited the typewritten manuscript which had been only partially revised before the author's death. Other notable books on music, issued in 1945, were Alfred Einstein's *Mozart: his Character, his Work* and Nicolas Slonimsky's *Music of Latin America*. There seems to have been enough interest in the provocative and stimulating Sunday articles, and reviews of Virgil Thomson, music critic of the New York *Herald Tribune*, to gather some of them together in a book, *The Musical Scene*.

Ballet and Dance. A certain restless characterized the ballet world in 1945. As yet, there were only some minor reshufflings, but there were all sorts of rumors of major reshufflings to come. Change, it would seem, is very much in the nature

of ballet (which is nearer to theater these days than to the conservative concert world). Though ballet had achieved a pinnacle of success, its sponsors seemed to feel that this state of affairs would not continue without some new fillip.

Alicia Markova and Anton Dolin came back to the fold of Hurok's Ballet Theater, having had their taste of daily performances for large, mixed audiences on Broadway, while the dancing team was in the cast of Billy Rose's *Seven Lively Arts*. Hurok took advantage of Markova's increased popularity by forming a road company under her name, in which she would be assisted by Dolin and a small cast. This would complete the picture of Markova's re-creation of the Pavlova legend in our time. She still, however, would appear with Ballet Theater.

Leonide Massine formed a company to tour popular excerpts from ballet, as the name implies: Massine's Ballet Russe Highlights. With Fortune Gallo as its impresarios, the role of the company as ballet's equivalent to Gallo's former San Carlo Opera was emphasized. Rosella Hightower and Irina Baranova (the latter returning from musical comedy) were its two first-rate ballerinas.

In the summer the rumor spread abroad that Col. Wassily de Basil, director of the Original Ballet Russe, was trying to return to the United States after two and one-half years in South America. His very large repertory would be a serious threat to other American companies. But this competition still remained in the sphere of possibility when Ballet Russe and Ballet Theater finished their fall seasons in New York. Around this time, still other rumors were rampant. Hurok was said to be planning to drop Ballet Theater, salvaging only some of its elements in a coalition with de Basil. Rumor also had it that these two might be joined by the Marquis de Cuevas, whose Ballet International had lost so much during its first season that even his fortune could not sustain it.

Signs of disintegration and dissension in Ballet Theater's ranks were to be observed when the chief choreographer associated with the company, Anthony Tudor, left it at the close of the New York season. With him went Hugh Laing, the chief interpreter of the major male roles of his ballet compositions. Tudor's last novelty, *Undertow*, after its premiere during the previous spring, had turned out to be the saga of an inhibited, neurotic sex-murderer. Nostalgia and frustration had appeared as subject matter in his previous works, but the new twist proved flagrant to the shockable.

Sex also crept into the predominantly pure, classical repertory of Ballet Russe de Monte Carlo, when it brought Ruth Page's *Frankie and Johnny* (music by Jerome Moross) from Chicago. This work made news headlines because of certain contingencies. Commissioner Paul Moss had just banned the Broadway play, *Trio*, because of allusions to sexual inversion. As assistant to Mayor LaGuardia in the administration of the New York City Center, however, Moss put himself in the embarrassing position of sponsoring, in his own theater, at the same time as he banned *Trio*, a ballet with similar implications, in a scene in front of a house of ill repute.

The ballet was purged, but its artistic quality was not such as to warrant its being kept in the repertory anyway. Ballet Russe distinguished itself with the much nobler task of honoring George Balanchine, the great Russian choreographer, on the 25th anniversary of his career. With about half a dozen of his leading works in its repertory, Sergei Denham, the company's impresario, ungrudgingly

turned over his resources to Balanchine, who was given ample rehearsal time to work out his difficult ballets with casts that gave him sincere and loyal cooperation. A good deal of the company's success was, in fact, attributed to Balanchine's rehearsing of it in the perfect execution of minute details and line in his own works. The perfection the dancers approached in Balanchine's ballets was reflected in the traditional classics of the repertory. Also, the company's love and admiration for Balanchine served to unite it in a common belief, and with much more modest resources, poorer lighting, and an inferior theater, Ballet Russe, led by the incomparable Danilova, easily competed with Ballet Theater.

Having achieved a smash-hit in 1944 with the first effort (*Fancy Free*) of a young choreographer, Jerome Robbins, Hurok encouraged other young choreographers to produce in the hope that he might find another such hit. Michael Kidd's *On Stage!* (music by Norman Dello Joio) and *Grazi-ana* by John Taras were, however, only mildly successful.

Martha Graham, after many years of struggle, showed the world in a concrete way that she had definitely arrived and that she had firmly established the movement known as the "modern dance," when she was signed up for a tour by Hurok, who always puts his bets on sure-fire products.

ARTHUR V. BERGER.

NARCOTICS, Bureau of. A Bureau of the U.S. Department of the Treasury, established in 1930. Commissioner. Harry J. Anslinger.

NARCOTIC DRUGS CONTROL. The most important development of the year was the adoption in December of a Resolution by the Preparatory Commission of the United Nations Organization to set up an Opium Advisory Commission within the UNO. At the San Francisco Conference the American Delegation declared that specialized drug agencies operating under existing treaties should be brought into relation with the new UNO. Author of the Resolution was Dr. Victor Hoo Chi-Tsai, one of the Chinese delegates to the UNO Preparatory Commission meeting in London.

The machinery of the League of Nations has proved effective in controlling the movement of both licit and illicit drugs in international trade. Even during the war, the controls established for peacetime conditions remained in force in those areas of the world where the United Nations exercised administrative authority. The Permanent Central Opium Board on July 17, 1945, reported that it was at that time receiving information from 49 metropolitan countries and 66 colonies and territories. In normal years, about 1500 returns were made; those received in 1945 numbered over 1,050.

Thus it is seen that world-wide cooperation in one field at least is an accomplished fact, even despite the interference resulting from total war. Not only has no Government denounced any of the Conventions, but there have been some new accessions during war years. With the exception of the very few countries of the world which had not ratified them, and with a few exceptions in Eastern Europe, all the Governments of the United Nations throughout the world and almost all neutral Governments have carried on their domestic control and collaborated with the international drug control bodies.

The Government of the French Republic announced the adoption of the principle of absolute prohibition of the use of prepared opium in all

territories in the Far East under French control. The Dutch and British had in 1943 adopted a similar policy discontinuing government monopolies where opium was sold at small cost for non-medical purposes such as smoking. Thus is brought much nearer the ultimate goal in international progress—limitation of the planting of the opium poppy to supply only the medical and scientific needs of the world—which has been delayed by the continuance of the government monopolies for smoking opium. No total for raw opium could therefore be settled upon, although the amount—400 tons—necessary for manufacture into medicine and scientific uses was already known. The smoking-opium requirements were the unknown X of the equation. This X is now removed, as far as the Dutch, British, and French are concerned. Unfortunately, government opium shops in Burma will probably be reopened. The only other serious stumbling-blocks remaining now are India and Iran, which incidentally constitute the largest sources of supply for illicit drug smuggling to the United States. So far, Afghanistan is the only producing country which has complied with the Judd Resolution. It prohibited all planting of the opium poppy from March 21, 1945, declaring it was ready to take this important step “in the interest of international cooperation and because of humanitarian sentiment.”

Further International Agreement Possible. The way should now be open for an international agreement between the principal countries which grow and export the raw material—Turkey, Greece, Yugoslavia, Iran, and India—and the important drug-manufacturing countries.

National Control. India remained one of the three principal sources of supply for the illicit traffic in the United States. (Iran and Mexico are the others, in the order named. The Government of Mexico extended cooperation in combatting this illicit traffic during 1945, with some very good results, but the problem remains serious.) For instance, a Chinese seaman was able to purchase as much as 63 pounds of Indian opium by making the rounds of several hundred shops in Calcutta and obtaining in each shop the quantity permitted to be sold to each customer. This opium, purchased in India for about \$1,000, would have brought about \$75,000 in the illicit market in the United States to which it was destined. It was seized upon the arrival of the Chinese seaman in Baltimore, Maryland. Indian opium seizures are being made with increasing frequency, and in increasing amounts.

In the decade before the war, drug addiction had been reduced by as much as 60% in the United States. However, in spite of all the rigid shipping restrictions in force throughout the war period, smugglers were successful in bringing to American shores considerable quantities of opium. Increased vigilance will have to be maintained in order to prevent another wave of drug addiction, such as the one which followed the first world war, and to maintain the gains which have been made in recent years in international narcotic drug control work.

H. J. ANSLINGER.

NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS. An independent Committee of the U.S. Government which coordinates and conducts aeronautical research. The principal research laboratories of the Government are the Langley Memorial Aeronautical Laboratory at Langley Field, Va., the Ames Aeronautical Laboratory at Moffett Field, Calif., and the Aircraft Engine Research Laboratory at Cleveland, Ohio. Chairman: Jerome C. Hunsaker.

NATIONAL ARCHIVES, The. An independent establishment of the U.S. Government, created in 1934, which accepts and preserves Government records. Archivist in 1945: Solon J. Buck.

NATIONAL BUREAU OF STANDARDS. This Bureau was established by act of Congress March 3, 1901. During the year 1945 it was made up of nine scientific and technical divisions, three divisions dealing with commercial standardization, a special division set up as a war measure and concerned wholly with military problems, and three divisions charged with the administration of internal affairs. The scientific and technical divisions, and those engaged in commercial standardization were: Electricity, Weights and Measures, Heat and Power, Optics, Chemistry, Mechanics and Sound, Organic and Fibrous Materials, Metallurgy, Clay and Silicate Products, Simplified Practice, Trade Standards and Codes and Specifications.

Dr. Lyman J. Briggs, Director of the Bureau since 1933, retired on November 5 after 49 years service to the Government. He was succeeded by Dr. E. U. Condon, who had been associate director of Westinghouse Research Laboratories since 1937. Five of the Bureau's division chiefs retired during the year: Henry W. Bearce, Weights and Measures; Hobart C. Dickinson, Heat and Power; Henry S. Rawdon, Metallurgy; Phaon H. Bates, Clay and Silicate Products; and I. J. Fairchild, Trade Standards. Douglas E. Parsons was appointed to succeed Mr. Bates; the other vacancies have not, as yet, been permanently filled.

This Bureau has continued to devote a large part of its time to work for the military agencies. Its regular appropriation of \$2,924,500, was supplemented by \$200,000 for special war research during the last 5 months of the year, and by transfers totaling approximately \$7,000,000 from the Army, Navy, National Defense Research Committee, National Advisory Committee for Aeronautics, and other agencies for projects in which they were interested.

The staff throughout the year has averaged about 2,000. Fifty-four research associates representing 14 national engineering societies and trade associations, were stationed in the laboratories. There is every indication that their number will increase as additional facilities can be released. The Research Associate Plan is an effective method of helping the smaller manufacturers and industrial groups that do not, themselves, possess the requisite laboratory facilities and research staff.

The Bureau's standard frequency radio broadcasts have been improved by announcements of actual times of day. The dissemination of information on ionosphere conditions and prediction of best frequencies to use between any two points has been one of the important services that the Bureau has rendered to the Army, Navy, and commercial organizations.

Storage batteries for aircraft use are being studied in a special laboratory recently completed. Airplane operating conditions are exceptionally severe, and previous tests have not been truly representative. An important part of the program involves substitutes for rubber as battery separators.

The ruling of precision theodolite circles has continued, and satisfactory progress has been made on the problem of transferring the rulings from a master circle to other circles by photographic processes. Tests by the Corps of Engineers show that these circles meet their requirements.

A large number of American-made chronometers have been tested. Their performance was such that

it was necessary to know the 24-hour interval to 0.01 second before they could be properly standardized. These American instruments were superior in almost every respect to the foreign-made chronometers, heretofore in universal use in this country.

The Bureau was represented at conferences on screw threads held in London and later in Ottawa. A cooperative research has been started by Canada, Great Britain, and the United States, which it is hoped will result in unifying the screw thread systems in use in these countries.

Basic information has been obtained on fuels that may be substituted for gasoline in automobile engines. This is of special importance to countries that do not possess petroleum resources and which have been obtaining gasoline on lend-lease. Tests of substances to be added in small quantities to gasoline to increase mileage, confirm previous conclusions that these additives are without any measurable effect.

Adsorbents, such as a bone char, are being studied with the financial support of several large companies in this country and in Canada. An extensive bibliography of the scientific literature on adsorbing materials has been published; it is believed to be the first of its kind in a field that is important to several major industries.

As the result of many experiments in the cutting of diamond dies used for drawing very fine wire, it was found that an electric arc at the contact between the diamond and the revolving lap, greatly increased the cutting rate. This, the only real improvement that has been made in cutting diamonds since the art was first practiced hundreds of years ago, is applicable to industrial and to ornamental diamonds and to diamond saws.

The distribution of standard chemical samples continues to be one of the Bureau's most direct services to industrial and Governmental laboratories. Samples of pure hydrocarbons and of paint pigments (color and tinting strength) are now included, as well as alloy steels for spectrographic analysis.

The Bureau has cooperated with the War Department in developing a color scheme and in selecting paints for the exterior and interior of general and convalescent hospitals. Use has been made of soft-toned, bright, cheerful pastel colors that create an atmosphere of restfulness. Standard color chips were prepared and sent to the various Service Commands, and a representative of the Bureau is visiting the hospitals to assist the post-engineers in carrying out the work.

A distant-reading indicating device has been designed and constructed for measuring the forces required to actuate the controls of an airplane. It is important that these forces be confined within rather narrow limits if performance is to be satisfactory. The instrument makes use of a spring interposed between the control and the pilot's grip which deflects proportionally to the force applied. An electrical transmitter and indicator are connected to the spring, so that the readings can be noted visually or recorded photographically at any convenient location.

A new 6 x 42 binocular, the body of which is made entirely of plastic, was designed in cooperation with the Army-Navy Munitions Board, and placed in production. Intended primarily for combat service, it is of the fixed focus, fixed interpupillary distance type, waterproof at a depth of 100 ft. It is resistant to fungi and corrosion, is compact, and weighs less than the standard binocular.

The mass spectrometer is being used with suc-

cess in the analysis of samples of liquid and gaseous organic materials particularly those that constitute the basis of synthetic rubber manufacture. A great deal of interest has been shown by industrial laboratories in the use of this instrument.

The installation of equipment in the rubber laboratory established by the Brazilian Government at the mouth of the Amazon has been completed, and the research program has been started under the supervision of a member of the Bureau's staff whose services were made available through the State Department. A tree has been developed that combines a strong root system, high rubber yield, and resistance to the leaf disease prevalent in South America. It is expected that this tree will be artificially cultivated, somewhat as is done in the Far East, but on smaller tracts of land, each of which will be leased to specially trained native families.

Means for preventing the deterioration of textiles and for producing special papers that will preserve goods during transit and storage in hot, damp locations have received special attention. The waterproofing of Army boots has been studied and a new protective treatment has been developed in cooperation with the Chemical Warfare Service, and the Office of the Quartermaster General.

The Bureau has examined many failures of welded ships, and it is evident that the presence of notches, because of faulty design or construction, is an important contributing factor. Steps must be taken to control either the design or material, or both. Changes in design have been made and now the problem is to insure the use of steels of low-notch sensitivity. The current research program calls for impact tests on a large number of specimens at various temperatures.

Outdoor exposure tests of metals have been continued at a seacoast site and have yielded important information on the corrosion resistance of aluminum, magnesium, and the light alloys used in aircraft construction. A set of full sized wings made of a magnesium alloy were among the specimens that have been subjected to tidewater attack in a marine atmosphere.

A start has been made on an investigation of "powder metallurgy"—the art of forming metal objects by compression and sintering of metal powders instead of by melting, casting, and machining to shape. An important characteristic of these powders is their rate of flow through a standard orifice; results of tests at the Bureau show that this varies with the kind of metal even among powders of approximately the same fineness. In other words, sieve tests are not a criterion of the rate of flow.

The ceramic coating developed at the Bureau for aircraft-engine exhaust stacks has been applied with success to "dry" and "wet" mufflers of boats and amphibious vehicles. Because of the rapid corrosion of the sheet metal from which these parts are made, they have to be replaced frequently, causing expense and loss of time. Very severe tests in the laboratory and in service show that the new coating has a high resistance to cracking and other damage even when heated to full operating temperature and then plunged into cold water.

A new furnace was designed and installed in the Bureau's optical glass plant. It is so constructed that temperatures can be equalized in much less time than in the ordinary type. This is accomplished by a continuous circulation of air by means of a powerful heat-resistant fan. Using this equipment it has been possible to anneal optical glass pressings in three days, instead of ten.

Since the end of the war and the abolition of the War Production Board, limitation orders governing

the use of materials have come to an end. Many of these orders included a simplified schedule as part of their requirements. Although the necessity for enforced simplification is now past, the industries concerned are in many cases anxious to retain the benefits of voluntary simplified practice. The Bureau is cooperating with all manufacturers who have shown an interest in this matter, notably with the structural steel group, the makers of dial pressure gages, and the asphalt industry.

A notable step in advance in the standardization of building materials and requirements was the adoption by all interested groups, of a voluntary commercial standard for prefabricated houses. This covers the structural strength of component parts, requirements for lighting and ventilation, and recommendations covering foundations, chimneys, heating, plumbing, insulation and electrical wiring.

The Code for Protection Against Lightning and the National Directory of Commodity Specifications have been revised and reprinted. The latter is the only complete, up-to-date compilation of standards and specifications having national recognition.

The results of the Bureau's work during the year (of a non-confidential nature) were made available through 111 publications (including papers in the Journal of Research) in the Bureau's own series and 58 articles in the technical press.

HUGH G. BOUTELL.

NATIONAL DEFENSE, Council of. A Council composed of the Secretaries of War, Navy, Interior, Agriculture, Commerce, and Labor, originally created by Act of Congress, Aug. 29, 1916. The Act authorized appointment of an Advisory Commission to the Council, composed of seven persons having specialized knowledge in certain fields. Such an Advisory Commission was appointed May 29, 1940, and constituted the beginning of the National Defense Program for World War II; its functions were subsequently absorbed by other agencies and are now performed by the War Production Board, Office of Price Administration, War Food Administration, and Office of Defense Transportation. See the articles on each of those agencies.

NATIONAL HOUSING AGENCY (NHA). The National Housing Agency was established by Executive Order on Feb. 24, 1942, to consolidate all nonfarm housing activities of the Federal Government. Policies are centered in the Office of the Administrator and operations are carried out through three major constituent units: The Federal Home Loan Bank Administration, the Federal Housing Administration, and the Federal Public Housing Authority.

With the end of the war and the rapid demobilization of our armed forces, the country faced an unprecedented housing shortage and the NHA immediately directed its full resources to stimulating the largest possible volume of home construction and to combatting inflationary real estate price trends.

The housing job ahead was one clearly calling for an all-out attack by industry, labor, and local, state, and federal government. Almost every city and town in the country had a housing shortage which had grown up over a period of years and resulted chiefly from two conditions: the lack of sufficient construction to meet increasing needs in prewar years, and the fact that, during the war, home construction had to be limited to shelter for migrating war workers so that all possible materials and manpower could go to the production

of weapons and equipment for our armed forces.

As more and more veterans returned to civilian life to look for homes or move in with friends or relatives, the nature and extent of the shortage became widely recognized.

NHA estimated that about 1,200,000 families were already living with others by Oct. 1, 1945, and that an additional 3,400,000 will need accommodations by Dec. 31, 1946. Approximately 2,900,000 of these will be families of veterans.

As the year ended President Truman appointed Wilson W. Wyatt, former Mayor of Louisville, Housing Expediter in the Office of War Mobilization and Reconversion to study the critical housing shortage and to recommend and execute a plan of action.

Subsequently, his powers greatly broadened by a delegation of authority from the OWMR, Mr. Wyatt was appointed Administrator of the National Housing Agency, and with approval of the President, announced the following program for 1946-1947:

The target for 1946: 1,200,000 homes started, 700,000 conventional houses; 250,000 permanent prefabricated houses; 250,000 temporary units.

The target for 1947: 1,500,000 homes started; 900,000 conventional houses; 600,000 permanent prefabricated houses.

To achieve the program, these emergency measures were recommended:

Preference for veterans in the rental or purchase of these homes.

Greatly expanded production of materials with Federal aid where needed

Greatly expanded labor force.

Deferment of non-essential construction

Rapid expansion of prefabrication.

Priorities and allocation of equipment and material.

Federal cooperation and assistance, where necessary, to develop building sites

Channel the largest part of materials into housing to sell for \$6,000 and less, or rent for \$50 a month and less

Curb inflation and continue rent control, establish ceiling prices on new and existing homes.

Federal insurance of mortgages on low cost homes up to 90 percent of value based on necessary current costs \$250,000,000 for re-use of temporary war housing, in addition to \$191,000,000 already available for that purpose.

Community participation paralleling Federal action through local emergency housing committees.

Reconstruction Finance Corporation to aid in financing production program; Federal funds to provide \$600,000,000 for premium payments for increased production of materials.

From the long-range point of view, the NHA estimated that the country needs 12½ million new dwellings in the next 10 years. Construction at this scale would mean an investment of from \$6 to \$7 billion annually and would provide more than 4,000,000 jobs, off and on the building site. To achieve these ends, and to move toward a goal of a decent home for every American family, proposals are pending in Congress to provide for the following:

1. New aids to private enterprise to encourage the production of housing for rent and sale in the "middle market."

2. Aids to communities to clear slums and blighted areas and prepare the land for redevelopment at economically sound costs.

3. Continued Federal aid to communities to provide low-rent public housing for families of very low incomes.

4. A broad program of technical and economic research aimed at aiding the building industry to reduce costs.

5. Aid to communities in analyzing their own housing problems and mapping out plans to meet the needs of all income groups.

At the conclusion of its war job, the NHA had carried out a program to provide shelter for some 4,000,000 migrating war workers and their families who comprised an estimated 9,000,000 persons.

About half these workers were taken care of in existing structures, largely through "Share Your Home" campaigns. Housing for the others had to be built.

Private financing was called upon to build when it could meet wartime needs and where there was reasonable assurance that there would be continued demand for the housing postwar. Public financing was used for the remainder. In all categories of war housing, private financing supplied more than a million dwelling units with an approximate private investment of nearly \$5 billions, a major share of it covered by FHA mortgage insurance. Public financing supplied over 830,000 units at a cost of \$2.6 billions.

Thus a core of the building industry was kept active in meeting imperative needs and in preparation for the postwar job. On Oct. 15, 1945, with the war ended, WPB Order L-41 (the war measure which restricted residential building to quotas established by NHA) was lifted.

As of Aug. 31, 1945, when the war housing program was closed, it stood as follows:

H-1 Housing for In-migrant War Workers

	Completed	Under Construction	To be Started ^a
Privately-financed	1,009,001	26,487	20,702
New permanent units	810,711	25,671	18,580
Converted units	198,290	816	2,122
Publicly-financed	832,241	22,004	4,978
New permanent dwellings	102,093	2,754	1,102
Demountable family dwellings	81,116	81	0
Temporary family dwellings	261,902	15,927	947
Converted family dwellings	49,370	6	427
Dormitory units	168,367	1,493	890
Stop-gap	79,383	1,743	1,612
Total H-1—Private and Public	1,841,242	48,491	25,680

H-2: Housing to Relieve General Congestion^b

Privately-financed dwellings	1,571	23,526	78,159
Publicly-financed dwellings	0	44	4,395
Total H-2 Private and Public	1,571	23,570	82,554

H-3^b Housing to Relieve Individual Hardship (all private):

New construction	12,900	41,800	16,746
Conversion Units	28,077	8,452	0
Total H-3	40,977	50,252	16,746
Grand Total—All War Housing—H-1, H-2, H-3	1,883,700	122,323	124,980

^a "To Be Started" is housing which was approved as of V-J Day; publicly financed housing in this category was terminated and privately-financed quotas which had not been taken by builders were withdrawn. Publicly financed war housing under construction was terminated where this was in the public interest. ^b Approximately 16,000 veterans who wished to build their own homes had H-3 priorities as of August 31.

Federal Public Housing Authority (FPHA). The agency is responsible for federally administered public housing programs. Toward the end of 1945, the FPHA had four principal functions:

1. The management of public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for civilian employees of the War and Navy Departments and of private industries completing war contracts, and for distressed families dislocated or displaced as a result of the war or demobilization.

2. The disposal of federally owned housing determined to be surplus to the above needs.

3. The extension of Federal aids to low-rent housing built before the war, and the conversion of

war housing to low-rent status under the U.S. Housing Act.

4. Extension of Federal aid on low-rent projects deferred by the war, as building labor and materials become available.

Before the outbreak of war interrupted construction of low-rent housing under the U. S. Housing Act, local housing authorities in 173 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings. The program thus far has been predominantly urban, but a small number of farm housing units were constructed under a rural program started shortly before the war.

The total development cost of the prewar low-rent projects was \$483,000,000. Although the FPHA is authorized to lend up to 90 percent of the development costs, it has actually supplied only two-thirds of the long-term financing, as a result of the ability of local housing authorities to sell bonds on the private market at an interest saving. All loans from the FPHA or private investors are being repaid in full, with interest, in accordance with established amortization plans.

To help keep rents within the means of low-income families, the FPHA makes an annual contribution, or subsidy, which for 1944 totalled \$8,600,000, or \$7.19 per dwelling unit per month. To June 30, 1945, Federal subsidy payments totalled \$43,409,000; this represents the entire cost to the Federal Government since the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the Federal contribution. This is normally done by exempting the projects from State and local taxes, as authorized by the U.S. Housing Act and State housing laws.

When the war began, only half of the program authorized under the U.S. Housing Act had been completed. Units under construction at that time were completed with the aid of priorities to house war workers, and are being turned back to the use of low-income families as conditions permit. Additional war housing projects were built under Public Law 671, which authorized the use of low-rent housing funds for war housing construction. Altogether low-rent housing funds provided 63,000 units for war workers. The 23,000 low-rent units scheduled in areas not requiring more war housing were deferred, pending availability of building labor and materials. As of Aug. 31, 1945, the total housing built or authorized under the United States Housing Act comprised 193,566 dwellings in 749 projects.

The major wartime function of FPHA was to provide publicly-financed housing for in-migrant war workers and their families; the FPHA being responsible for the construction and management of about four-fifths of the total provided. The remainder was provided by other agencies, principally the War and Navy Departments and the U.S. Maritime Commission. For the total public war housing program, some \$2,600,000,000 was made available, all from Congressional appropriations or loan authorizations except \$29,000,000 expended by the New York State Division of Housing.

From these funds some 864,000 accommodations were scheduled for families or single persons, and all but 32,000 units had been completed by Aug. 31, 1945. The war housing completed includes 585,000 family dwelling units, 168,000 dormitory units, and 79,000 trailers, portable shelters, and other forms of stop-gap housing. These figures include accommodations made available by re-use of trailers and temporary or demountable units

which were moved from one location to another.

Not counting units that may be transferred to the FPHA by the NHA or the Surplus Property Administration, the FPHA had some 656,000 units, completed or under construction contract, to dispose of. These include:

1. About 321,000 temporary units, unsuitable for long-term use as housing. These shall be removed within two years after the end of the emergency except where the Administrator, in consultation with communities, determines there is a longer need in connection with orderly demobilization.

2. About 181,000 permanent units, including 107,000 of standard construction, and 74,000 demountables which may be dismantled and re-erected at new locations. These will be sold to occupants or other private purchasers, unless transferred to other Federal agencies, or state and local governments.

3. Some 63,000 war housing family units, built with U. S. Housing Act low-rent funds, which will be turned to the use of low-income families.

4. A stock of 35,000 trailers, which will be disposed of by an appropriate agency designated by the Surplus Property Administration.

5. About 56,000 family and dormitory units converted from existing structures, mostly under 7-year leases, which will be returned to private owners at the expiration of the lease term or sooner if the owners purchase the unexpired lease term.

Federal Housing Administration (FHA). The Federal Housing Administration was established in June, 1934, by the National Housing Act "to encourage improvement in housing standards and conditions, to create a sound mortgage market, and to provide a system of mutual mortgage insurance" as part of the program to revive the construction industry and the home financing market. The FHA does not itself make loans but insures private lending institutions on residential loans meeting FHA conditions.

The FHA popularized the single, long-term amortizing mortgage bearing a low fixed interest rate. The maximum FHA interest rate today is 4½ percent plus the FHA insurance premium of ⅓ of 1 per cent, both calculated on annual outstanding balances. The premium is deposited in the Mutual Mortgage Insurance Fund.

Peacetime functions of the FHA are carried out under Titles I and II of the National Housing Act. Title VI was added as a war measure in March, 1941, to help provide private housing, temporarily meeting emergency war housing needs, but designed and built for permanence.

Title I provides for government insurance to lending institutions on loans for property improvements, alterations and repairs. Most of these loans are limited to a maximum amount of \$2,500 and a maximum term of 3 years, and are repaid through monthly installments.

Title II provides for insurance of mortgage loans ranging up to \$16,000 made by approved private lending institutions, and for monthly amortization of the loans over periods as long as 25 years.

Title VI was added to the National Housing Act specifically to assist in providing housing for war workers and a separate War Housing Insurance Fund was established. Insurance activity under this Title ended in August, 1945.

Most of FHA's operations during the war period were conducted under Title VI. Mortgages so insured were limited to a maximum of \$5,400 on a single-family house; \$7,500 on a two-family; \$9,500 on a three; and \$12,000 on a four, and could cover up to 90 per cent of FHA valuation.

Also, under the Title, FHA was authorized to insure mortgages on large-scale rental projects up to 90 percent of the appraised valuation but not to exceed \$5,000,000 for any one project.

Approximately 450,000 dwelling units for war workers were provided by mortgages insured under Title VI, for which the total insurance authorization was \$1,800,000,000.

From the start of the national emergency in July 1940 up to the surrender of Japan, approximately 750,000 new privately financed dwelling units were started under all FHA Titles.

The long-term program of the FHA has enabled more than 1,600,000 families to build, purchase, or refinance their homes, or to rent modern quarters. FHA insurance under Title II is now more than \$5,133,000,000 and FHA repair loans under Title I, exceeding more than 5,000,000 in number, aggregate \$1,903,733,000. As of Aug. 31, 1945, approximately \$2,090,689,150 of the mortgage loans and more than \$1,600,000,000 of the repair loans had been repaid through regular monthly payments or prepayments.

In addition to being self-supporting, the FHA has been able to declare two dividends on certain groups of mortgages under the participation provisions of the Mutual Mortgage Insurance Fund. The first disbursement was made to approximately 13,000 mortgagors in 18 groups who prepaid their mortgages in 1944. As of Jan. 1, 1945, equity balances had accumulated in 14 additional groups, and this second dividend will eventually be shared by nearly 142,000 mortgagors who still remained in these groups on that date.

Federal Home Loan Bank Administration (FHLBA) The Federal Home Loan Bank Administration directs the operations of the three agencies established to encourage home ownership and economical home financing, and to protect savings:

- (1) The Federal Home Loan Bank System was authorized in 1932. The System provides a nationwide home-mortgage credit reserve for thrift and home-financing institutions. Following the national pattern set up for commercial banks in the earlier inauguration of the Federal Reserve System, 12 regional Federal Home Loan Banks were organized, each to serve member home-financing institutions in its area by making both short and long term advances to meet their needs. Through the regional Banks funds may be shifted from areas of abundant credit to areas of scarcity. Since their establishment, they have advanced \$1,497,966,000 to their member institutions, of which \$112,450,000 was outstanding on Aug. 31, 1945.

Member institutions of the System totaled 3,699. Of these, 3,659 were savings and loan associations, cooperative banks and homestead associations, including 1,469 Federal Savings and Loan Associations for whom membership is mandatory; 25 mutual savings banks and 15 insurance companies were also members of the System. Assets of member institutions amounted to \$8,087,000,000. The System is self-supporting.

- (2) The Federal Savings and Loan Insurance Corporation was created in 1934 by Congress to provide an insurance program for investors in savings and loan associations and similar home financing institutions. Federal Savings and Loan Associations were required to be insured; insurance is optional for state chartered associations. The public confidence inspired by the fact that savings are so safeguarded has provided a steady flow of funds into insured institutions. About 4,300,000 investors in 2,475 savings and loan associations, with combined assets of approximately \$5,700,000,000,

are now protected by insurance up to \$5,000 each. The FSLIC has been self-supporting.

(3) The Home Owners' Loan Corporation, over a period of three years following its creation in 1933, refinanced delinquent mortgages on more than a million homes, providing low-interest, long-term loans which gave the owners a new chance to rehabilitate themselves. In these rescue operations, approximately \$3,093,000,000 was loaned to home owners, an amount increased to \$3,490,000,000 by later advances to borrowers and other disbursements by the Corporation.

Almost 74% of this investment has been liquidated through collections on the Corporation's loans and the sale of properties securing the mortgages which it was obliged to take over by foreclosure. Since 1936 the primary functions of the HOLC have been its collections and the general liquidation of its assets—as well as aiding its borrowers to meet their payments and retain their homes. Although the agency was forced to acquire a total of 198,127 houses by foreclosure, all but 663 had been sold by Aug 31, 1945.

On that date HOLC was collecting on 515,684 accounts. Of those, 391,732 were original borrowers and the rest were purchasers of acquired properties. A total of 488,109 borrowers and purchasers of HOLC houses had paid off their accounts in full. More than 84,000 borrowers were making monthly payments in amounts greater than called for by their contracts.

Notwithstanding the fact that HOLC made loans to home owners badly in arrears on their old mortgages, and high losses were originally anticipated, the operations during the twelve months ending last Sept. 30, resulted in a net income of more than \$20,000,000. This reduced the net deficit to \$86,000,000, which is less than 24% of the Corporation's total investment in loans and properties.

Liquidation of HOLC accounts to that date represents an acceleration of about 13% over amortization schedules. Unless something wholly unexpected develops to interfere with present progress, there is little doubt that liquidation will be completed within the time set by law, without loss to the Government.

JOHN B. BLANDFORD, JR.

NATIONAL INVENTORS COUNCIL. Created in August, 1940, by the Secretary of Commerce, the Council is a central clearing house for inventions and suggestions relating to the national security and welfare. Since its creation, more than 200,000 inventions have been carefully examined and evaluated, a surprisingly large number of which have proved meritorious and useful.

Dr. Charles F. Kettering, President of the General Motors Research Corporation, is Chairman and other members include eminent scientists, inventors, Government officials, and business men well versed in the application of new devices, all of whom serve without compensation. The Council staff includes a corps of competent engineers and technical experts—each a specialist in his own field.

CHARLES F. KETTERING.

NATIONAL LABOR RELATIONS BOARD (NLRB). In the last fiscal year, as in the preceding 12 months, more election cases were filed with the National Labor Relations Board than in any single year of the Board's history. Of 9,737 cases brought to the Board's attention, 7,310, or over three-fourths of them, sought Board resolution of questions concerning union representation; the remaining 2,427,

or less than 25 percent, involved allegations of unfair labor practices.

The Board is entrusted with administration of the National Labor Relations Act, often referred to as the Wagner Act. Signed into law by President Roosevelt on July 5, 1935, it guarantees American workers the right to organize and bargain collectively.

In passing upon this legislation Congress sought to prevent strikes over the issues of union recognition and anti-union discrimination. Further, it sought to promote industrial peace and equality of bargaining power through encouragement of collective bargaining. In essence, the Act sets forth a public policy to encourage collective bargaining free from employer interference, restraint or coercion.

In order to achieve results consistent with this national policy, the Board was given two functions: (1) to conduct secret ballot elections to determine freely chosen representatives of employees for collective bargaining purposes; and (2) to eliminate and remedy those practices by employers which discriminate against employees in any manner because of union membership or activity.

These illegal practices are set forth in Section 8 of the Act which enumerates five types of employer conduct that deny, abridge or interfere with employees' right to bargain collectively. Specifically, under this section employers may not:

(1) Interfere, restrain or coerce employees in their self-organizational rights;

(2) dominate, interfere with, or support the formation or administration of any labor organization;

(3) discriminate in any manner in regard to hire or tenure of employment in order to discourage or encourage membership in a union;

(4) discriminate against an employee for filing charges or giving testimony under the Act; and

(5) refuse to bargain collectively with the duly chosen representatives of his employees.

In the ten years that the Act has been on the statute books, 77,231 cases have been filed with the Board. Of these, 37,306 involved unfair labor practice charges and 39,925 concerned questions of representation.

The Board endorses and stresses the use of informal procedures for the achievement of results consistent with public policy. Thus, of the total 77,231 cases handled, 62,712, or 81.2 percent of them, were disposed of informally—without the necessity of hearings, decisions or subsequent court litigation. Taken separately, over 90 percent of the unfair labor practice cases handled were so settled; of the representation cases, 72.6 percent were so adjusted.

The magnitude of the Board's election job and American workers' interest in it, can best be seen by the fact that in the ten years of the Board's existence, over 6,000,000 workers have gone to the polls to vote in Board-conducted elections. Approximately 24,000 such elections were held during that period.

In 20,000 elections a majority of employees voted for a union; in 9,545 polls the C.I.O. was successful in obtaining representation rights; A.F.L. affiliates scored in 7,945; unaffiliated unions were chosen in 2,510; and no union was selected in the remaining 3,850 balloting.

During the fiscal year, 893,758 workers voted in the 4,919 elections held by the Board. The C.I.O. was victor in 1,898 of these polls; A.F.L. unions won 1,620; unaffiliated unions were chosen in 560; and no union was selected in the remaining 841 elections.

The returning serviceman, when viewed through the operations of the Act, is considered in the same light as a civilian worker; he is treated as an employee who temporarily finds himself in his country's uniform and who, upon his return to his bench, will be entitled to the same rights as he always enjoyed.

Inasmuch as the Board's basic functions impinge upon the serviceman, the Board has had occasion to hand down rulings saying: Individuals who are in uniform do not cease to be employees of their employer before they entered the armed forces. Employees who have been discriminatorily discharged prior to their military service must be offered full reinstatement upon their return to civilian status. Employees who are in the armed forces, whenever administratively feasible, will be permitted to cast their ballots in elections for the determination of representatives to act as bargaining agents. Whenever a labor organization is certified by the Board as exclusive bargaining agent, the certification is made subject to review when a sufficient number of employees have returned from military service.

Before the Board can certify a representative it must first ascertain which employees comprise an appropriate unit for collective bargaining purposes. Under the Act, the employer, craft, plant unit or subdivision thereof may be found appropriate. An appropriate unit also may be composed of employees of one plant, several plants, or all the plants of one employer. Similarly, employees of one or more crafts or departments may form an appropriate unit.

Among the more important factors considered by the Board in arriving at a unit determination are the following: the history, extent and type of organization of employees; the history of their collective bargaining; the history, extent and type of organization of employees in other plants of the same employer, or other employers in the same industry; the skill, wages, work and working conditions of the employees; the desires of the employees; eligibility of the employees for membership in the union or unions involved; and the relationship between the unit or units proposed and the employer's organization, management, and operation.

Only 6,900 of the 24,000 elections held during the ten-year period were conducted pursuant to orders of the Board; the remainder, or 72 percent of all elections, were based and conducted on the complete agreement and mutual arrangement of the parties.

In November 1945, with 2,100 bargaining elections on its docket, the Board adopted a new policy to expedite the disposition of reconversion representation issues. This policy, in the form of an addition to the Board's current Rules and Regulations, makes it possible for representation elections to be conducted in certain types of cases without awaiting a formal direction of election by the Board in Washington; any necessary hearings are held after the conduct of the election by the Board's agents. The Board's purpose was to remove quickly any simple questions of majority representation from the area of industrial strife since many of the cases pending before it are and will continue to be tied in with industrial reconversion efforts. In making the change the Board noted: To the extent that these representation questions are promptly answered, that the employer knows with whom he is to bargain and that employees realize that they can designate representatives to settle shop problems, to that extent will the Board have furthered reconversion to full-time output of civilian goods.

To correct unfair labor practices the Board is authorized to issue cease and desist orders and to take such affirmative action, including reinstatement with or without pay, as will effectuate the policies of the Act. Of the 11,000 formal decisions issued in the decade—comprising over 60 bound volumes—2,600 of them concerned employer unfair labor practices. To remedy illegal practices the Board ordered the reinstatement of 300,000 employees, 30,000 of whom received back pay. These compensatory pay awards totalled \$9,000,000. Over 2,000 company unions were ordered disestablished. In 5,000 cases collective bargaining was ordered, while in 7,000 cases notices of compliance with Board decisions were directed to be posted. These posted notices informed employees that they were free to engage in collective activity without interference, as guaranteed by the Act.

Decisions and orders of the Board are not self-enforceable. There are no penalties or fines. Either the company or the Board may petition the appropriate Circuit Court of Appeals for enforcement. Following this, either party may petition the Supreme Court for review. It is only after a court has upheld a Board order and an employer has refused to comply that he may be held in contempt of court and subject to court penalties.

As of Oct. 1, over 600 Board cases had been litigated in the various Circuit Courts of Appeals and in the Supreme Court. In the Circuit Courts, 343 of these were upheld in full; 78 were set aside; and 167 were modified. Of the 55 that reached the Supreme Court, Board orders were enforced in full in 52 cases; in only 2, or less than four percent, were Board orders set aside.

An additional duty was given the Board by Congress during 1943. This was the conduct of strike votes in accordance with Section 8 of the War Labor Disputes Act. From the date of the passage of this Act, June 25, 1943, up to Dec. 1, 1945, a total of 4,260 dispute notices had been filed. Of these, 2,293 were withdrawn before the end of the 30-day period stipulated by the statute. Strike polls were conducted by the Board in 1,306 instances, and on Dec. 1, 1945, 606 such cases were pending before the Board.

In November alone, 578 of these strike petitions were filed. This influx of strike vote petitions caused the Board to protest to Congress that the conduct of such votes had become administratively impossible. The Board pointed out that its work of conducting N.L.R.A. elections, intimately tied in with orderly reconversion of industry to peacetime production, was being neglected because of the time and money required for the handling of War Labor Dispute Act cases, and called upon Congress to repeal the section requiring the Board to conduct the strike votes.

PAUL M. HERZOG.

NATIONAL MEDIATION BOARD (NMB). A nonpartisan independent Board of the U.S. Government, created by amendment of the Railway Labor Act in 1934, whose duty is to mediate differences between the railroads, the express and Pullman companies, and the airlines on the one hand and their employees on the other. Chairman in 1945: Harry H. Schwartz.

NATIONAL PARKS AND MONUMENTS. With the end of hostilities and the lifting of gasoline rationing, the National Parks again took a prominent place in the vacation plans of the traveling American public. After the end of the Japanese fighting, travel to many of the parks doubled within a few days and

the Labor Day week-end travel was about back to prewar totals. With this increase, travel for the 1945 travel year (ending September 30, 1945) totaled around ten million, compared to a prewar high of twenty-one million in 1941. During war years, park travel dropped to a low of approximately seven million. Of the ten million this year, over two million were men and women of the American armed forces in uniform.

The parks remain relatively undamaged by the demands of war. Proposed exploitation of timber, minerals, and grazing lands within the parks proved to be of negligible value to the war effort and the parks enter the peacetime years undisturbed by any major war uses. The lease by the United States Navy of the Ahwahnee Hotel in Yosemite National Park, Calif., as a Convalescent Hospital was terminated in December. Many hundreds of battle-weary veterans, principally from the South Pacific, found rest and relief from war strain in the inspiration and recreation of Yosemite National Park.

The Statue of Liberty, N. Y., was relighted on May 8, 1945, after a blackout lasting over three years. This symbol of Democracy again stands as a welcome to the men returning from the battlefields of Europe.

Fort Frederica National Monument, Ga., was added to the National Park System on August 30, 1945. This site contains the ruins of an old fort established for military protection by the Georgia colonists against the Spanish colony in Florida. The total number of national park areas was 169 at the end of the year. These include:

National Parks	27
National Historical Parks	4
National Monuments	85
National Military Parks	11
National Battlefield Parks	1
National Battlefield Sites	7
National Historic Sites	10
National Memorials	9
National Cemeteries	11
National Parkways	3
National Capital Parks	1

Protection for park forests was emphasized during war years. Unusually dry forest conditions and severe dry lightning storms during late August of 1945 threatened the northwestern parks with the worst fire season in many years. However, prompt action kept total acreage burned well below the ten-year average in spite of critical shortages of manpower. In general, man-caused fires decreased in numbers during war years.

Artificial feeding of bears in Yellowstone National Park, Wyo.-Idaho-Mont., and Yosemite National Park, Calif., was eliminated during the year as a move to further portray the wildlife of the parks in a wholly natural setting. This move will stop unnatural concentrations of the bear populations, will permit them to fend for themselves for food, and should reduce the number of accidents to visitors from unwise familiarity with the park bears. This bear-feeding problem has become particularly acute in Yellowstone which has an extensive grizzly bear population.

More than 300 acres of virgin timber in Mount Rainier National Park, Wash., was purchased for an addition to the park. This timber was in imminent danger of being logged. Its purchase is another step forward in the land program of the National Park Service which hopes for the ultimate acquisition of all of the more than 600,000 acres of non-federal land within the boundaries of National Park System areas.

Because funds for park administration and maintenance were cut sharply during the war years, only minimum maintenance of park roads, trails, buildings, campgrounds, and other facilities was possible. The Service now faces the task of rebuilding and repairing these facilities to take care of greatly increased numbers of visitors. Many of the visitors in 1945 did not find the accommodations available that are ordinarily provided and that will be offered as funds and manpower permit. Most of the hotels and cabin camps in the parks were closed for the duration, and putting them in shape again is a major project facing the concessioners who operate them.

During the year, inquiries from Wales, England, Scotland, Brazil, and South Africa indicated a continuing interest in national park developments in other lands. At the United Nations Conference in San Francisco special memorial services were held in Muir Woods National Monument, Calif., for the late President Franklin Delano Roosevelt.

NEWTON B. DRURY.

NATIONAL WAR FUND. In the Fall the National War Fund issued its third and final nation-wide appeal to meet the needs of its 19 member agencies. The goal, like that for 1944, was \$115,000,000.

The War Fund was organized in 1943 as a federation of the leading war-related appeals, with the exception of the Red Cross, for providing comforts, hospitality and entertainment for our armed forces and merchant marine, recreational and educational materials for prisoners of war, and supplementary emergency war relief to the people of our Allies and to wartime refugees from Axis oppression.

The War Fund's joint appeal was presented to the American public through community war funds and war chests, linked in Community Chest cities with campaigns for established local services for health and welfare. Forty-three thousand individual soliciting committees in cities, towns and townships took active part in raising funds for the federated appeal.

The National War Fund was a voluntary war agency. Although not government-controlled or financed, it was government-endorsed, and it operated in accord with the President's War Relief Control Board.

It is estimated that National War Fund member agencies extended their services in 1944 to 69,806,900 people in 125 different countries and major geographical areas. Of this total 17,643,000 were children and 5,921,000 were refugees. It is further reported that in 1944 these agencies supplied 6,350,000 pounds of food, 27,962,000 pounds of clothing and \$4,343,200 worth of medical supplies, drugs and equipment.

Member Agencies: USO (United Service Organizations), United Seamen's Service, War Prisoners Aid, Philippine War Relief, Belgian War Relief Society, United China Relief, American Relief for Czechoslovakia, American Relief for France, Greek War Relief Association, American Relief for Holland, American Relief for Italy, United Lithuanian Relief Fund, Friends of Luxembourg, American Relief for Norway, American Relief for Poland, United Yugoslav Relief Fund, American Field Service, Refugee Relief Trustees, U.S. Committee for the Care of European Children.

Officers: President, Winthrop W. Aldrich; Secretary, Ralph Hayes; Treasurer, Gordon S. Rentschler; Vice-presidents, Jean B. Adoue, Jr., Prescott S. Bush, Robert M. Hanes, Francis P. Matthews, Walter Rothschild, Edward L. Ryerson, Robert G. Sproul, and Henry M. Wriston; Chairman of

Budget Committee, Gerard Swope; Chairman, Public Relations, Thomas D'Arcy Brophy; General Manager, Harold J. Seymour. Headquarters: 46 Cedar Street, New York 5, N. Y.

NATIONAL WAR LABOR BOARD. The year 1945 saw the operations of the National War Labor Board reach full and fairly stable maturity during the first six months but, following the August victory over Japan, brought a gradual liquidation of the Board's activities and final termination of the agency on Dec. 31 under Executive Order 9672. The executive order ended a four-year program for peaceable settlement of labor-management disputes by government arbitration, but transferred the modified wage stabilization program—second of the WLB's two wartime assignments—to a newly-created National Wage Stabilization Board.

Probably the major action of the Board during the initial six months of the year, while the agency was active, was a report of Public Members to the President on Feb. 20 recommending that no change be made in the Little Steel Formula, a basic wage stabilization device under which general wage increases were permitted for groups of employees up to a limit of 15 percent above the level of Jan. 1, 1941, to offset advances in the cost of living. Liberalization of the rule had been requested by both the A.F.L. and the C.I.O., and separate comments objecting to the findings of the Public Members were submitted by both the A.F.L. and C.I.O. members of the Board. Industry members agreed with the recommendation but objected to the further recommendation that war-caused innovations in industrial practices be made postwar norms. Basic conclusions of the report were that upward revision of the formula would bring about a new round of general wage increases such as threatened the stability of the economy in 1942, and that wage controls should be ended only as a part of a broad economic plan to assure high levels of civilian production and employment in the post-war economy.

Other significant developments of the early part of the year included the Board's decision of Feb. 21 ordering 55-cent minimum wages for the New England and Southern textile industries to correct substandards of living and calling, as well, for "balanced and properly aligned" wage structures; the Feb. 21 denial of general wage increases to packinghouse workers (but with an order for the parties to negotiate well balanced wage structures), and a July 21 decision holding the War Labor Disputes Act superior to any state law in connection with a contested maintenance of membership clause in a union contract with a St. Joe, Florida, paper company case. A court test of the power of the President to seize a non-war establishment (Montgomery Ward & Company) for defiance of Board order resulted in a decision of the Chicago District Federal Court on Jan. 27, holding such seizure illegal, but the decision was reversed by a U.S. Circuit Court of Appeals on June 8. (A final adjudication of this legal point appeared unlikely in view of subsequent refusal of the U.S. Supreme Court to review the case on the ground that the issue was "moot" because seizure of the property had been terminated).

With the collapse of Japan on Aug. 14 and sudden shift of economic trends, there started, however, a succession of changes in the disputes and wage stabilization programs and in the War Labor Board itself. In his statement of Aug. 16 the President announced a relaxation of wage controls consistent with a loosening of the labor market and

also a program to terminate the WLB as a disputes-settling agency "as soon after conclusion of the forthcoming industry-labor-conference as the orderly disposition of the work of the Board, and the provision of the War Labor Disputes Act permit; and after facilities have been provided to take care of the wage stabilization functions under the Act of Oct. 2, 1942."

Two days later, on Aug. 18, the broad plans announced by the President were more carefully defined in Executive Order 9599 directing the War Labor Board to continue wage controls with such modifications as were necessary to prevent either inflation or deflation, and to move as rapidly as possible toward the removal of controls and toward the restoration of collective bargaining. In the field of wage stabilization, the Board acted promptly with adoption of General Order 40, which for the first time since October, 1942, permitted employers to make wage increases not affecting prices without prior approval of the Board. An exception was made in the case of the building and construction industry, in which controls were continued on the former footing. In the field of industrial relations, the Board urged the parties in some 3,000 pending disputes to renew collective bargaining and to settle the issues without further recourse to the Government. New dispute cases were accepted by the Board and its agencies only upon joint agreement of the parties to accept any decision as "final and binding."

On Sept. 19, Executive Order 9617 was issued transferring the WLB, and certain other war agencies, to the Department of Labor. This, however, did not tangibly alter the character of the Board inasmuch as the agency was preserved as an entity within the Department of Labor, with autonomy over its powers, personnel, funds and other administrative operations. Likewise, correspondence with the Secretary of Labor established that the Board was to retain full autonomy over its policies and decisions.

The Board's termination program was speeded again in October with announcement that, effective Oct. 22, the Board would not hear the merits of any new disputes cases and would accept such cases only for the purpose of appointing an arbitrator to hear and decide the issues. In the meantime, the Board fixed Jan. 1, 1946, as its final termination date and laid plans for disposing of all pending matters before that date. The month also brought the issuance of Executive Order 9651 amending Executive Order 9599 and setting up standards for approval of wage increases which may be used by employers as a basis for obtaining higher prices.

In November, as requested by the President, the Board moved toward providing facilities for continuance of the wage stabilization program by setting up within the framework of the Board a six-member Wage Stabilization Division of tripartite composition to rule upon voluntary wage applications involving "price relief," to rule upon all wage decrease cases (all wage decreases continued to require prior approval of the Board) and to deal with other phases of the program. The wage-price policies to be applied by the Division and related government agencies were set forth in greater detail on Dec. 5 by Stabilization Administrator John C. Collet and the practical application of these policies was spelled out fully in a series of regulations issued by the Division on Dec. 27. These regulations explained that with the exception of certain increases in the basic steel industry and the building and construction industry, "the

general rule is established that wage or salary increases may be made lawfully in any amount and at any time without the approval of the National War Labor Board." With the two exceptions, the sole effect of approval of a wage increase application was to permit the increase to be used as a basis for higher prices, rents or costs of goods furnished to the Government. Denial of an application, however, did not prevent the applicant from placing into effect immediately all or any part of the proposed increase, and did not mean that such increase was unlawful under the wage stabilization laws or that it was disapproved by the Government. Conforming to the policies of the executive orders and the stabilization administrator, the regulations permitted approval of "cost of living" wage increase for groups of employees whose average straight-time hourly earnings had not risen 33 percent above the level of 1941; wage increases to correct inequities between plants by comparison of rates within a plant with the average rates currently prevailing in an industry or area, and wage increases necessary to overcome manpower shortages in certain "bottleneck" industries which constituted interference with the national reconversion program.

The final step in the liquidation of the Board came on Dec. 31, 1945, when Executive Order 9672 terminated the agency and created a National Wage Stabilization Board to carry on the wage control functions. Physically, the members and staff of the new Board were drawn from those of the previously-operating Wage Stabilization Division and the expired WLB. W. Willard Wirtz, chairman of the Division, was named chairman of the NWSB.

With termination of the War Labor Board, it becomes possible to review its work and to determine the extent to which it achieved its two objectives of minimizing wartime disputes and of stabilizing the general wage levels to combat inflation.

In the first of these tasks, the National Board and its agencies from Jan. 12, 1942, to Aug. 18, 1945, dealt with 17,807 disputes which were deemed threatening to the war effort and issued decisions, normally involving many issues, affecting approximately 12,300,000 employees. Probably the most significant yardstick of the agency's effectiveness is the fact that the percentage of all working time lost by strikes and lockouts from Pearl Harbor until V-J Day was $\frac{1}{400}$ of one percent as compared with $\frac{27}{100}$ of one percent in the five peacetime years 1935-39. In other words, operation of the no-strike program reduced the loss of production time during the war to approximately one-third of its peacetime levels. The comparative speed in termination of stoppages is demonstrated by the following table showing the average duration of strikes in the prewar and wartime years: 1939, 23 days; 1940, 21 days; 1941, 18 days; 1942, 12 days; 1943, five days; 1944, 5½ days.

In accordance with the voluntary no-strike, no-lockout pledge of labor and industry, compliance with the Board's decisions came about by voluntary acceptance, rather than by compulsion, in most cases. Of the 17,807 disputes handled up to V-J Day, 50 were turned over to other agencies to compel compliance. In 40 cases seizure was ordered by the President and in four cases economic sanctions were applied by the Office of Economic Stabilization. Six ultimately were settled without action. In 26 of the disputes unions were in defiance; in 23 cases employers were in defiance and in one case both sides defied the order of the Board.

While any attempt to measure the effectiveness of the wage stabilization program as administered by the Board involves many intangibles, some conclusions may be drawn by a comparison of the average level of urban wage rates before and after inauguration of the program. In the 21-month period from Jan. 1, 1941, to Oct. 2, 1942, urban wage rates in manufacturing industries rose 17 percent or at a rate of 0.8 percent a month. In the 34-month period from Oct. 3, 1942, to Aug. 18, 1945, the increase was 13.6 percent or at a rate of 0.4 percent a month. Thus the advance of the inflationary spiral was reduced by one-half its former rate of progress. It was estimated further that of the total rise of 13.4 percent during the period of control, about one-third could be ascribed to immediate increases granted by the WLB, with most of the remainder resulting from increased output of incentive workers, more liberal management policies in the matter of merit increases and other factors outside the jurisdiction of the agency.

While the basic wage rates were being held in line, however, total wages were permitted to advance so that the increase in straight-time hourly earnings (adjusted to discount increases caused by shift of workers to higher-paid industries) amounted to 40.5 percent from Jan. 1, 1941, to July, 1945. In the same period the cost of living advanced by an estimated 33 percent. Thus, it appeared that real hourly wages—the amount of wage paid in a job for an hour of work—were slightly higher at the close of the war than on Jan. 1, 1941.

During the entire period of wage stabilization, from Oct. 3, 1942 to Aug. 17, 1945, the National Board and its agencies ruled upon 412,543 voluntary requests for wage adjustments and allowed increases (in original decisions before appeals) in whole or in part in 353,749 instances, affecting the earnings of 23,233,000 workers. Of these workers, 10,916,000 received immediate increases in basic wage rates averaging 6.1 cents an hour, while the remaining 12,317,000 received either non-immediate increases in basic wage rates or such other benefits as paid vacations, shift differentials and the like. In settlement of disputes, 1,915,000 workers received an average immediate increase in basic wage rates of 5.6 cents an hour, while another 3,577,000 workers received other benefits affecting their wages. (Statistics in disputes cover three-fourth sample of cases.)

Distribution of increases appeared to vary little between the union groups, and between the union and non-union groups. In voluntary cases, the average immediate increases approved by the Board were distributed as follows: AFL unions, 5.3 cents an hour; CIO unions, 4.8 cents an hour; independent unions, 4.7 cents an hour; unorganized employees, 6.5 cents an hour. In dispute cases, the averages were: AFL unions, 5.8 cents an hour; CIO unions 5.3 cents an hour; independent unions, 6 cents an hour.

JOHN A. STUART.

NAVAL PROGRESS. The surrender of Germany and Japan eliminated two major aggressors from the world's sea lanes. Together, the powerful U.S. and British Commonwealth navies now hold undisputed sway over the world's sea highways. The high cost of modern fighting ships, and the technological and scientific establishment needed to maintain an efficient Navy and Fleet Air Arm in postwar years, should serve to deter any smaller power from undertaking naval construction that

will challenge the hegemony now held by the U.S.-British sea alliance. The surviving warships of Germany and Japan have been seized by the United Nations, all their submarines sunk, and the serviceable surface ships divided among the victor nations. These powers will not be permitted to possess any naval establishment whatever in postwar years. As for the Italian Navy, it is slated to be cut to just a coastal defense force, with some ships divided among the United Nations.

Radar—U-Boat Nemesis. Early in the war the anti-U-boat campaign was a continuous pitched battle of radar against anti-radar devices. The Nazis developed a receiver to pick up Radar ASV signals and were successful for a time in ship sinkings. When Allied ships and planes instituted an improved type of anti-submarine radar (microwave ASV set), U-boat losses increased sharply. These losses helped destroy the German confidence in their U-boats until they found one of these new sets in a fallen British plane. Then the deadly battle commenced again. New ingenious Nazi devices included "radar coatings" which were painted on protruding U-boat parts, such as periscopes or conning towers. Effective counter-measures were developed by the combined efforts of U.S. and Britain, however. By the fall of 1944 the Nazi Navy had decided the only way for a sub to live was not to come up at all. They invented an air-tube they called "Schnorkel," which enabled a U-boat to breathe and to run its Diesels while submerged. The Allies too were ready with new devices, such as the electric Sonobuoy. With this, U-boats were being sent to the bottom at the rate of nearly one a day.

Radar revolutionized fleet tactics, making possible a new flexibility in surface-ship warfare, particularly in darkness. Without it even the overwhelming naval might which drove the Japs from the high seas and brought American forces within the shadow of Tokyo would have had much rougher going. Radar also came to the aid of the British by helping to cripple the Italian fleet. This magic weapon was developed so that optical control of firing of all weapons except pistol and rifle had been practically abandoned. (Rocket improvement also led to small rocket ships that could fire in a few seconds a broadside of metal greater than that of the newest battleships. Radar permitted these ships to come close in-shore, rockets being ineffective at long range.)

The Sonobuoy. One of the secret devices which helped crush the Nazi U-boat campaign in the latter part of the war was an instrument called the Sonobuoy, a small radio-equipped buoy which, when dropped by plane near a submarine, broadcast a faithful record of the sub's underwater progress. The Nazis never overcame the Sonobuoys. When a U-boat was located several Sonobuoys were dropped by parachute in the area by a plane. A small carrier-based fighter plane could carry dozens of them. Thereafter, every throb of the U-boat's engines would be continuously broadcast to the plane or to a surface ship over the horizon many miles away. The Sonobuoys also recorded the disintegration of U-boats when caught by depth charges, bombs, or the rocket device called Hedgehog which later replaced the depth charges.

The Hedgehog. Known technically as the Mark 10 and 11 anti-submarine projectors, the Hedgehogs were an improvement over depth charges which they replaced in the fall of 1942. Designed by the British, the Mark 10 operated on the rocket principle, the device mounting 24 projectiles, arranged in a bank. Designed to keep level despite the yaw

and roll of the sea, the Hedgehog hurls its charges from the bow of the attacking ship in an elliptical pattern above the calculated position of the submarine. After being hurled from a distance up to 200 yards, they exploded on contact only, instead of on the principle that detonates the depth charge. Thus, when an attacker hears an underwater explosion, he knows a hit has been scored. The charges were thrown within 2.5 seconds, and in 1.8 seconds by the improved Mark 11. The Mark 11 was placed in production in the U.S. in January, 1944. Both types are credited with a major role in the sinking of approximately 300 U-boats.

The Wakeless Torpedo. Early in the war, it was discovered that British and U.S. ships were being sunk by invisible U-boat torpedoes. Electrically driven, this new type left no telltale wake. Within 4 months after Pearl Harbor, the U.S. Navy had experimental electric torpedoes under development. The first successful wakeless type, the Mark 18, was fired by a U.S. sub in September, 1943; by the fall of 1944 it was standard equipment on all submarines. These electrically propelled torpedoes accounted for some 300 Jap merchant ships and naval vessels, with a total of 1,000,000 tons, including the 30,000-ton battleship *Kongo*.

The Atom Bomb and Future Navies. The atom bomb has brought the question, "Will navies become obsolete in the atomic age of the future?" We have little doubt concerning the effectiveness of an atomic bomb against a battleship or a fleet of warships in close formation, but the effect in an underwater blast, the only kind that can really damage a submarine, is questionable. And what future enemy would care to use an atom bomb against even a group of submarines which can be replaced faster than the costly bomb? The submarine is destined for a new role in the atomic age. In fact, in enlarged form it may become a fleet's most powerful arm. We can visualize a 5,000-ton undersea boat carrying 6 or more planes, each plane armed with rocket guns. Rockets may even be installed in the sub's launching tubes and torpedoes removed. Submarines of the future may be much faster, can be equipped with the "schnorkel breathing mast" and have far greater range than present types. Atomic bombs themselves may be launched from a submarine or carried from the sub by one of its planes. Add the increased range of the future submarine to the range of the planes it will carry, and you get a possible picture of these undersea craft launching surprise atomic or rocket attacks far offshore, instead of having to close in on targets. There is also the possibility that torpedoes which some submarines may still carry may be equipped with atomic warheads to blast an enemy harbor (as a prelude to invasion). A distinct advantage of the submarine in launching an atomic bomb is the element of surprise. Any long range bomber plane can be detected by enemy radar and perhaps shot down more than 200 miles from its target; but a sub, crossing the ocean submerged (and hence not subject to radar detection), can surface at night for just a few minutes near an enemy shore, and launch an atomic bomb by rocket or small plane. Because the coasts of United States and the British Isles are as highly vulnerable to this type of attack as any potential enemy coasts are, submarine, anti-submarine, and even amphibious warfare research and experiments must continue unabated by both countries.

American naval laboratories are now working on pilotless robot jet-propelled planes that will carry atom bombs to be launched from the decks of our huge fleet of fast carriers. With such planes the

Navy's air power would be world dominant. There would still be light surface fighting ships and fast carriers. But surface warships have become auxiliaries to air power.

Naval Intelligence. The ability to crack the Jap Navy's code gave the U.S. and British navies the key to victory in the Pacific. The code-cracking operations were conducted at four main points. Chief of these were the U.S.N. intelligence set-ups operating at Pearl Harbor and in Gen. MacArthur's staff at Hollandia, while the British collaborated with check points and information-gathering posts at Colombo, Ceylon, and Melbourne, Australia. The terrific punishment inflicted on the Jap merchant marine by our submarine fleet is also traceable to the code penetration. The Jap supply routes had been learned and even the sailing times of some convoys. The crushing defeat of superior Jap naval forces in the Battles of Coral Sea and Midway, and the complete destruction of the 32-ship Bismarck Sea convoy led the Japs to suspect something was amiss; they adopted the practice of sending out occasional dummy operational orders, giving false dispositions and unintended moves. Behind the code cracking still lies an unrevealed secret—the espionage system that gave the U.S. Navy the progress of Japan's naval building plans, and the size of various task forces they had to meet.

United States. At the end of the War the U.S. Navy found itself the greatest sea-air power the world has known. The fleet exceeded all the other world's navies combined. So large had it grown it required 3,389,000 men, plus 484,000 in the Marine Corps and another 173,000 in the Coast Guard, to man its ships, planes, training stations and bases. (In 1941 the Navy had 244,606 officers and men.) In December, 1941, there were 17 battleships, 7 aircraft carriers, 1 escort carrier, 18 heavy and 19 light cruisers, 172 destroyers and 113 submarines, a total of 347 combatant ships. Including ships of all types, the fleet totalled 7,695 vessels. It had grown to only 12,000 ships when the attack on Guadalcanal was mounted in August, 1942. It had grown to 55,229 by July, 1944, when Guam was invaded, was up to 73,852 in January, 1945, at Luzon, and over 100,000 ships when the beaches of Okinawa were stormed in April. This huge total included over 1,300 combat ships, and over 10,292 auxiliary types, the balance being chiefly landing craft. Total tonnage of this vast armada was well above 12,000,000.

The Navy lost 696 vessels of all types during the war, as a result of enemy action and all other causes. Losses by types were: battleships, 2; aircraft carriers, 5; escort carriers, 6; heavy cruisers, 7; light cruisers, 3; destroyers, 71; destroyer escorts, 11; submarines, 52; minelayers, 3; minesweepers, 24; sub-chasers, 18; gunboats, 12; Coast Guard vessels, 15; seaplane tenders, 3; MTB's, 69; landing ships (LST, LSM, LCT, LCI, LCS, etc.), 144; tugs, 10; tankers, 6; troop transports, 21; district patrol craft, 36; miscellaneous district craft, 152; cargo vessels, 4 and miscellaneous auxiliaries, 22. The Navy's war casualties in personnel (as reported Nov. 1, 1945) were: 56,261 killed; 80,260 wounded; 8,908 missing; 710 prisoners, a total of 146,139. These figures include the Marine Corps (which suffered over 72,000 of the total casualties) and Coast Guard.

During the war and including combat ships still under construction late in 1945, the Navy built 9 battleships, 3 battlecruisers, 3 giant carriers, 24 fleet carriers, 11 light carriers, 117 escort carriers (of which 38 went to Britain), 22 heavy and 42 light cruisers, 344-odd destroyers, over 455 de-

stroyer escorts (with 92 going to our Allies), and 203 submarines, a total of over 1,233 combatant vessels. (Some 98 frigates built by the Maritime Commission and later manned by the Coast Guard are not included in these figures). The combat ship strength of the U.S. Fleet late in 1945, including ships nearing completion, was:

Type	Number	Tonnage
Battleships	24	840,600
Battlecruisers	3	82,500
Aircraft Carriers (CVB)	3	135,000
Aircraft Carriers (CV)	27	717,500
Aircraft Carriers (CVL)	10	117,000
Aircraft Carriers (CVE)	80	737,000
Heavy Cruisers	33	421,200
Light Cruisers	57	513,450
Destroyers	445	850,000
Destroyer Escorts	363	468,000
Submarines	263	367,750
Total	1,308	5,250,000

Postwar Plans. The Navy contemplates a peacetime fleet of 6,084 naval vessels of all types, and an air force of 3,731 combat planes on active duty. Combat ships will number 1,082 of 4,688,500 tons, or only 226 less than peak strength. The auxiliary fleet will number 5,002 vessels, a cut of over half from its present strength of 10,292 ships. To man the peacetime fleet 500,000 enlisted men and 58,000 officers for the Navy, and 100,000 enlisted men and 8,000 officers for the Marine Corps, would be required. Compared with the prewar carrier strength of 7 ships and 6,000 naval pilots, the peacetime fleet will need around 18,000 pilots and 23 carriers in commission. Cost of the Navy's peacetime establishment (excluding the Coast Guard which is being returned to the Treasury Dept.) would approximate some \$3,525,000,000 annually. The 1,082 combat ships planned leaves the Navy with 226 surplus warships on hand which are to be disposed of, preserved as historic relics or scrapped and stricken from the Navy Register. The ships are: battleships *Arkansas*, *New York*, *Texas*, *Nevada*, *Pennsylvania* and *Mississippi* (the latter to replace *Wyoming* as a training ship); the aircraft carriers *Saratoga*, *Ranger* and *Enterprise*; the damaged escort carrier *Sangamon*; the battle-damaged heavy cruisers *Pensacola* and *Salt Lake City*; the 9 "Omaha" class light cruisers; 78 destroyers and 63 destroyer escorts, mostly worn out in service, and 64-odd submarines. On Jan. 24, 1946, the Navy revealed the following warships are to be used in the Bikini Atoll Bomb Test in May and July: Battleships *Arkansas*, *New York*, *Nevada*, *Pennsylvania* and *Nagato* (Jap); Heavy cruisers *Pensacola*, *Salt Lake City* and *Prinz Eugen* (German); Light cruiser *Sakawa* (Jap); Aircraft Carriers *Saratoga* and *Independence*; destroyers *Mayrant*, *Trippe*, *Stack*, *Rhind*, *Bagley*, *Helm*, *R. Talbot*, *Mugford*, *Lamson*, *Flusser*, *Conyngham*, *Smith*, *Anderson*, *Mustin*, *Wainwright* and *Hughes*; subs *Skipjack*, *Tuna*, *Parche*, *Dentuda*, *Searaven*, *Skate*, *Pilotfish* and *Apogon*. The 1,082 combatant ships and 5,002 auxiliary ships of the Navy's peacetime fleet (as shown in accompanying table) will be organized into active (to be kept fully manned and ready for instant action), ready reserve (reduced commission but ready for action on short notice), and laid up reserve (decommissioned on a caretaker basis but available in an emergency).

For special branches of the service, see AERONAUTICS; COAST GUARD; PHOTOGRAPHY; also, COMBINED CHIEFS OF STAFF. For outlays on the U.S. Navy, see PUBLIC FINANCE; UNITED STATES under

U.S. NAVY'S POSTWAR FLEET
(As proposed Oct. 30, 1945)

Combatants		Ready Re- serve	Laid- up Re- serve	Total
Types	Active			
Battleships ^a	5	6	7	18
Battlecruisers	3	0	0	3
Aircraft Carriers (CVB)	3	0	0	3

Other auxiliaries	418	22	235	675
District craft	146	1,680	219	2,045
Total	1,375	2,209	1,418	5,002
Grand total combatants and auxiliaries	1,672	2,313	2,099	6,084

^a The Navy contemplates maintaining the five 45,000-ton *Iowas* in active service, the six 35,000-ton *North Carolina* classes in ready reserve, and the 3 *Marylands*, the two *Californias* and 2 of the *New Mexico* class in laid-up reserve.

The total combatant tonnage of the post war fleet is as follows: 18 battleships of 665,000 tons, 3 battle-cruisers of 82,500-ton, 3 big carriers of 135,000-ton, 24 fleet carriers of 650,000-ton; 10 light carriers of 117,000-ton; 79 escort carriers of 725,000-ton; 31 heavy cruisers of 403,000-ton, 48 light cruisers of 450,000-ton; 367 destroyers of 760,000-ton; 300 destroyer escort of 387,000-ton and 199 subs of 314,000-ton, a grand total of 1,082 combat ships of a combined 4,688,500-ton.

NOTE: The Navy announced on Feb. 7, 1946, revised figures for its postwar combat fleet, as follows ACTIVE: 4 battleships (with *Kentucky* remaining uncompleted through 1946); 3 CVB's; 10 CV's; 13 CVE's; 8 CA's; 20 CL's; 135 DD's; 36 DE's and 90 subs, a total of 319 Ready Reserve: 6 battleships; 4 CV's and 1 CVL; 9 heavy and 9 light cruisers; 40 destroyers and 4 DE's, a total of 73. The balance of 687 ships will be in laid-up reserve and will include the 3 new *Alaska* class battle-cruisers and the uncompleted heavy cruisers *Salem*, *Dallas*, *Newport News* of the *Des Moines* class. On Jan 30, 1946, the Navy cancelled 1 unnamed heavy cruiser of the *Des Moines* class, the CA 141.

Appropriations. For production of material, see BUSINESS REVIEW; WAR PRODUCTION BOARD; also, CONTRACT SETTLEMENT, OFFICE OF. For personnel, see SELECTIVE SERVICE SYSTEM and topics listed under ARMED FORCES.

Foreign Navies. Australia. At the end of the war the R.A.N. consisted of 4 cruisers, the 8-inch gunned *Australia* and *Shropshire* (latter acquired from Royal Navy); the 6-inch gunned *Hobart* and *Adelaide*; 11 destroyers; 2 sloops; over 12 frigates and some 55 fleet minesweepers plus numerous auxiliaries. The Navy had a personnel of some 35,000 officers and men. At least 2 aircraft carriers and 5 new destroyers will be acquired from British Navy in 1946. The 3 "Napier" (N) class destroyers acquired in 1941 will be returned.

Brazil. On V-J Day the Navy comprised two old 19,200-ton battleships; one old 3,150-ton cruiser; 9 new plus 1 old destroyer; 8 new DE's; 6 old T.B.'s; 3 subs; 6 new corvettes; 5 modern mine-layers, plus numerous sub-chasers, river gunboats, etc. During the war the Navy acquired from the U.S. Navy 8 new DE's and over 15 sub-chasers; completed 6 destroyers of the "Amazonas" class, 3 of the "Dias" class and 6 corvettes.

Canada. When Canada entered the war her naval establishment, considering her extensive stretch of seacoast, was the smallest in the world. All she could muster was a fleet of 7 destroyers, 6 mine-sweepers and an odd-dozen of assorted coastal vessels with a naval nucleus of 1,774 officers and men. At the conclusion of the war the R.C.N. had expanded more than 50-fold to a strength of over 300 warships, 400 auxiliary naval vessels and a personnel upwards of 95,000. The 300 warships were made up of the new light cruisers *Uganda* and *Ontario*; the light fleet carrier *Warrior*, the escort carriers *Puncher* and *Nabob* (all on loan from Royal Navy); 23 destroyers (including 6 old ex-U.S. ships); 75 odd frigates; over 120 corvettes; 3 auxiliary A.A. cruisers and over 70 fleet mine-sweepers. Postwar plans include the disposal of the old ex-U.S. destroyers, the 14 and 15 year old destroyers *Assiniboine* and *Saguenay*, the corvettes, minesweepers and most of the coastal craft built or acquired during the war. Frigates and auxiliary

COMPARATIVE NAVAL STRENGTH OF LEADING POWERS
(As of Dec. 31, 1945)

(Figures given for foreign navies are estimated only)

Note: "Present Strength" includes warships under construction after V-J Day.
^a Excludes *Omaha* transferred to Russia. ^b Frigates omitted. ^c Includes 1 battleship, 1 cruiser, 28 destroyers, 15 subs on loan to foreign navies but excludes 33 lend-leased escort carriers and 58 frigates or DE's being returned to U.S. ^d Includes large sloops and cutters. ^e Includes scuttled ships salvaged and reconstructing. ^f Includes 1 Br. battleship and 1 U.S. light cruiser acquired under lend-lease and 55 Nazi U-boats (45 seized and 10 acquired under agreement with U.S. and Britain).

cruisers will be put into reserve. Personnel of the R.C.N. will be reduced to 10,000 by March, 1946, and only 3 of the 14 wartime naval bases will be maintained—Halifax, Sydney, and Esquimalt.

France. By the end of 1945 the French Navy had succeeded in salvaging over 100,000 tons of a total of 270,000 tons of combat ships scuttled at Toulon, Nov., 1942. Besides the battleship *Strasbourg*, the seaplane carrier *Comm. Teste*, the light cruisers *La Galissonnière* and *Jean de Vienne*, several destroyers, subs, and escort ships have been salvaged, with some of the light units already back in service. The scuttled battleships *Dunkerque* and *Provence* and the light cruiser *Marseillaise* are a total loss. The badly damaged battleship *Jean Bart*, brought back from Casablanca, is undergoing reconstruction. With the *Richelieu* and old *Lorraine* now in service and the *Strasbourg* and *Jean Bart* reconstructing, the French fleet should have 4 battleships in service in the near future. (The old battleship *Paris* is now a training ship.) The French Navy also possesses the escort carrier *Dixmunde* (ex-HMS *Biter*), the plane transport *Béarn*; the heavy cruisers *Suffren*, *Duquesne* and *Tourville*; the light cruisers *Gloire*, *Montcalm*, *Georges Leygues*, *Emile Bertin*, *Jeanne D'Arc*, *Duguay-Trouin*, the smaller *Le Triomphant*, *Le Fantasque* and *Le Indomptable-Malin*; 30-40 odd destroyers; 12 odd frigates and DE's; 30-40 submarines; 6 gunboat-sloops, numerous corvettes; minelayers and other auxiliaries. The postwar strength of the navy's personnel will be reduced to 45,000 officers and enlisted men. It totalled 70,000 on Jan. 1, 1946, and 85,000 on Sept. 1, 1939.

From Britain's share of the surrendered German fleet, France has received 6 destroyers (2 *Narviks*, 2 *Maas*, 2 *Elbings*), 2 T.B.s. and 5 large minelayers. Augmented by these and other light units from the British and U.S. Navies, the French Fleet today totals about 330,000 tons, or slightly more than half its prewar strength.

Germany. Like the Jap Navy the German surface fleet was completely destroyed before her surrender in May, 1945. A fleet built for commerce raiding but not even used with offensive spirit and determination for that purpose, suffered in the end the piecemeal destruction for which such defensive handling foredoomed it. All the Nazi Navy had afloat and in "serviceable condition" at the time of her surrender totalled 140,000 tons of combat ships and 90,000 tons of auxiliaries. Included were the heavy cruiser *Prinz Eugen* and light cruiser *Nürnberg*; 30 destroyers and torpedo boats and 144 U-boats.

It was reported in January, 1946, that the surviving German ships now operable or which can be made so have been divided between Britain, U.S. and Russia. A total of 1,789 naval vessels of all types were involved—2 cruisers, 30 destroyers and t.b.s., 30 of latest type U-boats, 48 depot ships and 1,679 small auxiliaries. Besides 10 U-boats apiece, each of the 3 nations received the following: U.S.—heavy cruiser *Prinz Eugen*, 7 destroyers and t.b.s., 12 depot ships and 560 small auxiliaries; Russia—cruiser *Nürnberg*, 10 destroyers and t.b.s., 15 depot ships and 507 small auxiliaries; Britain—13 destroyers and t.b.s., 21 depot ships and 612 small auxiliaries. The British at the same time revealed that their Navy had scuttled 114 surrendered U-boats in the North Atlantic. The 2 badly damaged cruisers *Admiral Hipper* and *Emden* are to be blown up. The uncompleted carrier *Graf Zeppelin*, seized by Russia near Stettin, presumably falls to the Soviets. The fate of the damaged light cruiser *Leipzig* was not announced up to the end of 1945.

As for the once great underseas fleet of U-boats, of which more than 1,000 were built during the war, only 144 remained afloat and in active service. The majority of these survivors were of the latest design, highly efficient craft of 1,600 tons each and fitted with the "schnorkel breathing mast" to permit submerged battery charging and apparatus to baffle our radar detection devices. Many others of this ingenious type were building at the war's end. U-boat losses totalled over 782 during the war. The Nazis lost 66(?) from Sept., 1939 to Dec., 1941; 85 in 1942; 237 in 1943; 241 in 1944, and 153 in 1945. They also destroyed or scuttled many others in port or on the building ways in the last stages of the war. In addition, the Russians captured 45 intact subs at Danzig in March, 1945, and destroyed many others during the war. These losses are in addition to the 782 destroyed by U.S. and British forces.

Great Britain. The British Navy lost naval parity because of smaller shipbuilding capacity, and now trails the U.S. Navy in strength. Before the war British naval strength was guided by a 2-1 standard, which meant in practice that she must maintain a margin of superiority over the combined naval strength of any two leading continental powers (namely, Italy and France, or Italy and Germany). But though she has taken second place among the world's naval powers, her strength is still far greater than that of all the European naval powers combined, including Soviet Russia. At the start of the war in September, 1939, the Royal Navy (including those of the Dominions) was composed of 12 battleships, 3 battlecruisers, 6 old and 1 new aircraft carriers, 17 heavy and 55 light cruisers, 215 destroyers and 56 submarines, a total of some 365 combatant ships. Losses during the war totaled 730 naval vessels, not including light coastal ships and landing craft. Of the 730, 260 were combatant ships as follows: 3 battleships, 2 battlecruisers, 5 aircraft carriers, 3 escort carriers, 5 heavy and 25 light cruisers, 3 fast minelayers, 1 monitor, 147 destroyers, DE's and frigates, and 70 submarines. Losses in personnel by the Royal Navy (exclusive of the Dominions) totalled 65,554 casualties, of which 50,898 officers and men were killed or missing.

The fleet late in 1945 is believed to have comprised 18 capital ships composed of 4 new "King George V's," 3 new powerful "Vanguard" class (completing), 2 "Nelsons," the battlecruiser *Renown*, 4 "Queen Elizabeths" and 4 "Royal Sovereigns"; 14 new (and one old) fast carriers, the *Illustrious*, *Formidable*, *Indomitable*, *Implacable*, *Indefatigable*, *Victorious*, *Venerable*, *Powerful*, *Colossus*, *Vengeance*, *Ocean*, *Glory*, *Warrior*, *Leviathan*, and the old *Furious* (now in decommissioned reserve); 7(?) escort carriers (CVE's); 10 heavy and 47 light cruisers (excluding 4 Australian); at least 225 destroyers; 100 frigates, large sloops and cutters; 128 submarines; 3 fast minelayers and 4 monitors, a total of some 556 combatant ships. Included in these figures are 1 battleship (*Royal Sovereign*), 1 fleet carrier, HMCS *Warrior*,⁹ CVE's (HMCS's *Puncher* and *Nabob*), 3 cruisers (HMCS's *Uganda* and *Ontario*, and O.R.P. *Danae*), 28 destroyers, 15 subs and a number of frigates "on loan to other navies." Excluded are 33 escort carriers and 58-odd "Captain" class frigates being returned to the U.S. Navy.

Under construction on V-J Day (last September) were 35 warships including one 42,000-ton battleship of the "Vanguard" class, at least 16 fleet type aircraft carriers (including the *Warrior* and 6 sister-ships, 4 of 33,000 tons each and 2 super 45,100

tonners, the *Audacious II* and *Ark Royal II*), 10 cruisers (including the 8,885-ton *Tiger* and *Blake*), and 8 destroyers, all of which were ordered before the Jap surrender. Three other battleships of the "Vanguard" class (previously mentioned), the *Vanguard*, *Conqueror*, and *Thunderer*, are rapidly being outfitted for service and should be on their builder's trials late in 1946. A third 45,000 ton carrier, the *Eagle II*, which was half finished, was cancelled in January, 1946.

No definite plans for Britain's postwar Navy had been revealed up to late December, but it is expected the Admiralty will follow the U.S. Navy's example of scrapping obsolete ships and laying up surplus vessels in reserve. Step number one in disposing of surplus warships that have outlived their usefulness was taken in October, when the Admiralty commenced the return of ships lend-leased from the U.S. The first group of "Captain" class frigates sailed back to the U.S. Only about 58 of the 78 received are being returned, for 20 have been lost. Step number two was taken last November and December when the first group of lend-leased CVE's returned to the Norfolk Navy Yard, U.S., with American troops. The baby flat tops were the *Shah*, *Searcher*, *Tracker*, *Stalker*, *Hunter*, *Attacker* and *Begum*. The remaining CVE's were scheduled to leave Southampton at the rate of 5 a month. In all, 33 of these escort carriers are being returned out of 38 lend-leased, the others being either sunk or "on loan" to other navies.

Italy. No final disposition was made of the Allied-controlled Italian fleet up to March, 1946, except for the temporary allocation of 15 torpedo craft to Soviet Russia. Although weakened considerably by heavy war losses, the Italian Fleet is still a strong sea force possessing 5 battleships (the new *Italia* and *Vittorio Veneto* and the old modernized *Cesare*, *Dulio* and *Doria*); 10 light cruisers (*Garibaldi*, *Abruzzi*, *Eugenio Di Savoia*, *Duca D'Aosta*, *Montecuccoli*, *Cadorna* and the smaller *Regolo*, *Africano*, *Magno* and *Traiano*); about 45 destroyers and large torpedo boats, 40-odd submarines, 10 sloops and corvettes, a seaplane carrier plus several midget subs, MTB's, minelayers, mine-sweepers, gunboats, etc.

The first postwar dent in Italian naval strength was taken in July when Soviet Russian crews took possession of 6 Italian destroyers at Italian ports. The ships were the new "Ariete" class destroyers *Leone II* and *Sauro II*, the older *Dardo* and 3 torpedo boats, the *Pleiadi*, *Cigno* and the new *Dezza*. Operating these ships should present no technical problem to the Russians as all of Russia's modern destroyers have been built to Italian design. The Italian Navy lost over 190 combatant warships, chiefly in action against the British Navy. Losses consisted of the new battleships *Roma* and *Impero* and the old *Cavour*; 1 armored cruiser; 7 heavy cruisers; 14 new light cruisers (including 8 uncompleted "Regolos"); 1 colonial cruiser; 75-odd destroyers and large torpedo boats and over 90 submarines.

Japan. Primarily to faulty strategy must we place the failure of Japan's Navy in this war. Where she might have used her fleet to seek out and destroy her enemy's navy, as the U.S. has done, she chose instead to use it principally as an adjunct to the army, for getting troops to their destination and protecting lines of communication. When compelled to give battle, as with the Russians in 1905, she chose to await the enemy in her home waters. It would seem that this concept of defensive naval strategy accounted for the remnants of Japan's fleet being kept lying in wait at home bases for an

American invasion, a decision that spelled disaster. (It is now known that most of the major ships had been placed out of commission.) Powerful Allied carrier raids on her warships moored at Kure, Sasebo, Maiduru, etc., completely wrecked what remained of Japan's once mighty fleet. Because of her inability to control even those sea and skyways adjacent to her own coast, Japan, without being invaded and with a large army virtually intact, had to surrender.

At the start of the war Japan had some 255 combatant ships and 135-odd auxiliary vessels in service, a total of about 390 in all. Combatant ships consisted of 10 battleships, 10 aircraft carriers (including the converted *Shoho* and *Zuiho*), 2 sea-plane carriers, 18 heavy and 17 light cruisers, 3 cruiser-minelayers, 125 destroyers and large torpedo boats, and 70-odd fleet submarines. During the war she built (or converted) over 825 naval vessels of all types including 2 battleships (*Yamato* and *Musashi*), 15 aircraft carriers (*Taiho*, *Shimano*, *Amagi*, *Chitose*, *Chiyoda*, *Katsuragi*, *Unryu*, *Hayataka*, *Hataka*, *Ryuho* and the CVE's *Chuyo*, *Unyo*, *Jinyo*, *Otaka* and *Kaiyo*); 5 light cruisers (*Sakawa*, *Agano*, *Noshiro*, *Yahagi* and *Oyodo*); 65-odd destroyers, an unknown number of destroyer-escorts; and about 125 oceangoing submarines, a total of over 212 combatant vessels. The 600-odd auxiliaries consisted of some 350 midget subs, PT-boats, frigates, escorts, plane transports, mincraft, fleet auxiliaries, etc. This gave the Japanese fleet a wartime total of over 467 combat ships and over 735 auxiliaries.

Approximately 670 ships of all types were lost or wrecked of which 340-odd were combat ships. Included in the 340-odd ships were 11 battleships, 27 aircraft and escort carriers (including 2 uncompleted); 16 heavy cruisers, 2 old armored cruisers, 22 light cruisers; 133-odd destroyers; and 129 oceangoing submarines. Auxiliary craft lost were 2 new seaplane carriers, over 50 midget subs, about 80 frigates and escort vessels, an odd dozen seaplane tenders and plane transports, numerous mincraft, transports, etc. U.S. Navy subs accounted for 276: including 1 battleship, 4 fleet carriers, 4 escort carriers, 3 heavy and 9 light cruisers, 43 destroyers, 23 submarines, and 189 auxiliary vessels. (In addition British subs sank 1 heavy and 1 light cruiser and 3 submarines.)

Japan ended the war with 532 naval vessels of which only 99 were combat ships. The huge balance consisted of small fry such as 300-odd midget subs, 93 frigates and escort vessels, gunboats, PT-boats, 1 sub-tender, mincraft, 2 old training ships, and the like. They had under construction before the war's end three aircraft carriers (*Kasagi*, *Ibuki*, and *Aso* (latter two wrecked in July, 1945, carrier raids); 3 heavy destroyers, 15 escort destroyers and 77 "other types" of naval vessels. Work on the carriers had been discontinued by April 1 but the building of the smaller naval vessels went on as late as August 27.

The Imperial Navy had a strength afloat and ashore of over one million men, including 250,000 manning naval vessels, 200,000 in the Naval Air Corps, 375,000 in overseas garrisons and the balance in navy yards, garrisons and communication centers on Japan's main home islands. Losses in personnel during the war totalled approximately 262,000 officers and men, of which 161,000 were killed (including 1,500 missing) and 101,000 wounded.

On Oct. 31, U.S. Secretary of State Byrnes disclosed that 61 of Japan's 99 surviving combatant warships—1 battleship, 4 carriers, 2 heavy and 3

light cruisers and 51 submarines—will be scuttled under the auspices of the U.S. Navy. (Japanese steel firms had melted down 30 subs at Kure up to February, 1946.) The remaining ships, 38 destroyers and some 93 patrol craft (frigates, escorts, gunboats), will be divided equally among the U.S., Great Britain, Soviet Russia, and China. The 10 major warships to be sunk are the battleship *Nagato*; the aircraft carriers *Katsuragi*, *Hayataka*, *Hosio* and *Ryuhō*; the heavy cruisers *Takao* and *Myoko*; the light cruisers *Sakawa*, *Kitakami*, and *Kashima*. With the scuttling of these 10 large warships and the transfer of the surviving smaller ships to the four United Nations powers, the Japanese Navy will cease to exist. (The *Nagato* and *Sakawa* were to be used in the Bikini atom bomb tests.)

Netherlands. Heavy losses weakened the Dutch fleet to such an extent that the Dutch Government today depends on the British Navy to protect her overseas empire. The fleet now consists of the small light cruisers *Tromp* and *Heemskerck*, the 4 British-built destroyers *Van Galen*, *Hiddes*, *Piet Hein II* and *Kortenaar II*, 13 subs (2 are British), 1 corvette and 1 frigate (both British), 2 gunboats, 2 sloops, 4 minelayers, 14 minesweepers plus numerous smaller auxiliaries. War losses were the cruisers *Java*, *Sumatra* and *De Ruyter*, 9 destroyers, 17 submarines, 1 coast defense ship, 3 gunboats, 1 sloop, 20-odd mincraft, 15-odd MTB's and over 50 fleet auxiliaries.

Sweden. Except for the completion of 2 small coastal subs, the U-8 and U-9, no new ships were completed during the past year. The only major ship completed during the war is the minelaying-cruiser *Alvsnabben*. Displacing 4,000 tons, she is equipped with four 6-inch guns and many small AA's. The 1800-ton destroyer *Öland* was launched on Dec. 16. Her sistership *Upland* should follow early in 1946. The two light cruisers, *Göta Lejon* and *Tre Kronor*, laid down in 1942 were not reported launched up to late 1945.

U.S.S.R. Soviet Russia now seeks to develop a fleet commensurate in size and power with her new importance as the world's greatest land power and one of the three most powerful nations on earth. It is to be expected that Moscow will allot more of the yearly budget in postwar years to the building up of a strong protective naval force, to operate in bordering seas. The exact strength of the Red Fleet has never been publicly released but certain ships are public knowledge.

The Red Fleet late in 1945 was believed to consist of the old battleships *Revolusia* and *Komuna* (and the *Marat* now decommissioned as unserviceable); the modern heavy cruisers *Petravlovsk* (ex-German *Lützow*), the *Kirov*, *Gorki* (?), *Kubyshev* (?), *Orjanskidze* (?), *Molotov*, *Voroshilov* and the old *Kavkaz* (*Red Caucasus*); the light cruiser *Krasni Krim* (*Red Crimea*); 21-odd heavy destroyers of the "Leningrad" class, 48-odd destroyers of the "Stremitelni" class, the super destroyer *Tashkent*, 17 old ex-czarist destroyers and torpedo boats, 18-odd torpedo boats of the "Serp" and "Shtorm" classes; over 250 submarines; the old training cruisers *Komintern* and *Aurora*; the sea-plane carrier *Stalin*, plus numerous mincraft, patrol craft, PT-boats, torpedo launches, river gunboats, icebreakers, etc.

During the war the British lend-leased 15 combat ships to Russia. This occurred on May 30, 1944, aboard the battleship *Royal Sovereign*, lying at anchor in the Firth of Forth near Edinburgh. The ships, besides the *Royal Sovereign* (renamed *Archangelsk*) are 10 former U.S. destroyers and

4 modern subs. The U.S. Navy lend-leased the light cruiser *Milwaukee* (renamed *Murmansk*), some 50 PT-boats, and over 200 new craft including large and small sub-chasers, patrol vessels, minesweepers, landing-craft, infantry, etc. Russia added to her sub fleet by seizing from the German Navy 45 intact U-boats in the harbor of Danzig on March 30, and also has possession of the damaged Nazi carrier *Graf Zeppelin*.

Warships known to be under construction are the battleship *Treti International*, the heavy cruisers *Frunze*, *Kaganovich* and three others unnamed, plus an unknown number of heavy and light destroyers, subs, patrol craft and gunboats. (See GERMANY, ITALY and JAPAN for Soviet Russia's share of Axis warships.)

JAY LAUNER.

NAVY, U.S. Department of the. A Department of the U.S. Government, established in 1798, which supervises and maintains a naval establishment in readiness for the performance of such duties as the President, who is Commander in Chief, may order. The principal divisions of the Department are as follows:

Executive Offices of the Secretary
Office of the Chief of Naval Operations
Bureau of Yards and Docks
Bureau of Naval Personnel
Bureau of Ordnance
Bureau of Ships
Bureau of Supplies and Accounts
Bureau of Medicine and Surgery
Bureau of Aeronautics
Headquarters United States Marine Corps
United States Coast Guard

For organization and activities of the U.S. Navy, see the articles on COAST GUARD, NAVAL PROGRESS, and WORLD WAR in this and previous volumes. Secretary of the Navy in 1945: James V. Forrestal; Under Secretary, Ralph A. Bard.

NECROLOGY. The following is a list of notable persons who died during the year 1945. For deaths of political significance, see the countries.

Abdullah, Achmed. Writer of adventure stories. Served in World War I as an officer in the British Army. Parents reported to have been Grand Duke Nicholas of Russia and an Afghan princess. He was raised as a Moslem, but at his death he was a Roman Catholic. Some of his novels are *Red Stain*, *Trial of the Beast*, and *Deliver Us from Evil*. Died New York, April 12, aged 64.

Agnelli, Giovanni. Italian industrialist; president of the Fiat Motor Works, publisher of *La Stampa*. A Fascist who was an important figure in the mobilization of Italy's industries for war, he survived the fall of Fascism but lost his business. Died Turin, Italy, December 16, aged 79.

Ainley, Henry. British Shakespearean actor. Died London, England, November, aged 86.

Albee, Dr. Fred M. (1876-1945). Orthopedic surgeon. Inventor of numerous techniques and instruments used in bone-graft operations. Died New York, Feb. 15.

Amery, John. Son of Leopold S. Amery, former British Secretary of State for India. Pleaded guilty to high treason by cooperation with Germany during World War II and sentenced to death by hanging, November 28. Sentence executed December 19, Wandsworth Prison, London. Aged 33.

Appleton, Robert. Publisher. Retired president of Robert Appleton Publishing Co., previously a member of D. Appleton & Co. Died North Andover, Mass., Jan. 19, aged 80.

Arosemena, Florencio M. Former President of Panama. Elected to office 1928 by the lightest vote in the history of the country. Driven from office January 2, 1931, by a revolutionary group and died New York, August 30, aged 72.

Aston, Dr. Francis W. (1877-1945). British scientist; perfected the mass spectrograph, which was used in research on heavy water and uranium 235. Awarded the Nobel Prize in 1922, he had served since 1935 as Chairman of the International Committee on Atoms. Died Cambridge, England, November 30.

Baker, Dr. Sara J. (1878-1945). Pediatrician. Headed the child-hygiene bureau in New York City. During her term in office the death-rate of infants was reduced from

144 per 1,000 in 1907 to 71 per 1,000 in 1922. Author of several books on pediatrics, and a consultant in child health for the U.S. Public Health Service and for the children's bureau of the Department of Labor. Died New York, February 22.

Baldwin of Bewdly, Countess. Wife of former Prime Minister of Great Britain, Lady Baldwin was an early advocate of votes for women. Died in her 70's, June 18, in Stourport-on-Severn, Worcestershire, England.

Barbier, George. Character actor. Educated in a theological seminary. Achieving his first success on Broadway as Quasimodo in *The Hunchback of Notre Dame*, he appeared later in *Beggar on Horseback*, *The Front Page*, and *That's Gratitude*. His career in Hollywood included parts in *The Big Pond* and *Million Dollar Baby*. Died at the age of 80, Los Angeles, August 19.

Barthélemy, Joseph. French politician and former professor of constitutional law at the University of Paris; served as Minister of Justice in the Vichy Government until March, 1943. Chief prosecutor at the trials in Riom, he was himself, at the time of his death, about to be tried for treason. Died, aged 70, near Toulouse, France, May 15.

Bartók, Béla (1881-1945). Hungarian composer. Appointed professor of music at the Royal Academy of Music in Budapest 1907. With Zoltán Kodály, he assembled a collection of some 6,000 Hungarian folk tunes. Made his first appearance in the U.S. in 1927 with the Philharmonic Orchestra in Carnegie Hall, where he played his *Rhapsodie, Op. 1*. Other performances in this country were frequent until 1943, when he and his wife, Ditta Pasztory Bartók, played his *Musica for Two Pianos and Percussion*. His compositions included operas, orchestral suites, symphonic poems, concertos for piano and violin, and piano and violin sonatas. Died New York, September 26.

Becker, Dr. Carl (1873-1945). Historian & educator. Professor emeritus of history, Cornell University. Works *The Heavenly City of the Eighteenth Century Philosophers*, *Progress and Power*, *How New Will the Better World Be?* Died Ithaca, N. Y., April 10.

Beer-Hoffman, Dr. Richard (1866-1945). Viennese poet and playwright. Works. *The Count of Charolais*, *Jacob's Dream*, *The Young David*, plays in verse. Died New York, Sept. 26.

Bellaire, Robert I. Journalist employed by *Collier's Magazine* as correspondent. Killed in Tokyo, Japan, September 30, when his jeep overturned. Aged 30.

Bellmann, Henry (Heinrich Heuer). Author, pianist, and teacher. Achieved his greatest success with *Kings Row*, a best-selling novel, 1940. Had taught music at De Pauw University and served as Dean of the Curtis Institute of Music. Died New York, June 17, aged 63.

Benevides, Marshal Oscar (1876-1945) Peruvian statesman. Provisional President twice. Foreign Minister. Died Lima, Peru, July 2.

Benchley, Robert C. Humorist and drama critic, on the staffs, successively, of the Curtis Publishing Co. of Philadelphia, the *New York Tribune*, *Vanity Fair*, the *New York World*, *Life*, and the *New Yorker*. A monologist and actor, too, he appeared in motion-picture shorts, *The Love Life of a Polyp* and *How to Sleep*, and in several full-length films. His best known books were *Of All Things*, *Love Conquers All*, *The Early Worm*, *The Treasurer's Report*, *No Poems*, *My Ten Years in a Quandary*, and *After 1908*, *What!* Died, New York, November 21, aged 56.

Bendix, Vincent. Inventor of radio direction apparatus for ocean-going vessels, founder of the Bendix Aviation Corp., and president of Bendix Helicopters, Inc. First interested in automobiles, he perfected a self-starter drive and a four-wheel brake. The founder of the Bendix Transcontinental Air Race and donor of the Bendix Trophy, he announced some months before his death a forthcoming helicopter sedan for four passengers. Died New York, aged 64.

Bertram, Adolph. Cardinal. Archbishop of Breslau and dean of the German Catholic hierarchy. Opposed the Nazis' attempt to weaken the church and in 1936 wrote a letter urging the German people to resist the government's drive against religion. Remained in Breslau to welcome the advancing Russians. Died August 12, aged 86.

Bibesco, Princess Elizabeth. British society leader and author of *Portrait of Caroline*. Daughter of Herbert Asquith, first Earl of Oxford and Asquith and former Prime Minister of Great Britain. Her husband, Prince Antoine Bibesco, nearly lost his position as minister of Rumania to the U.S. when his wife attempted to participate in U.S. affairs by supporting John W. Davis in the presidential election of 1924. Died Bucharest, Rumania, April 7, aged 48.

Blozis, Alfred C. Former indoor and outdoor shotput champion of the National Amateur Athletic Union. In March, 1941, he established a shotput record, unequalled since, of 56 ft. 4 1/2 in. He had also played professional football with the New York Giants. Lieutenant Blozis was killed in the Vosges Mountains of France, January 31, while attempting to rescue a comrade; aged 26.

Bong, Major Richard. Military aviator. Killed near Burbank, Calif., on August 6, 1945, while testing a jet-

propelled fighter plane, the P-80 Shooting Star. He had received the Congressional Medal of Honor, as well as many other awards, and had shot down 40 Japanese planes in the Pacific theater of war. Aged 24.

Borchard, Leo. German orchestral conductor. Refused to collaborate with the Nazis and was regarded as a key figure in the restoration of German music. He was shot by sentries in Berlin, August 23, 1945, when the driver of his car ignored their signal to halt. Aged 46.

Bose, Rash Behari. Indian politician. Exiled from India; assumed Japanese citizenship, 1923, and later became an adviser to the Japanese sponsored "Provisional Government of Free India." Further helped the Japanese by urging over the radio that Asia be reserved for the Asiatics. Died Tokyo, January 22, 1945, aged 59.

Bourdet, Edouard. French playwright. Formerly director of the Comédie Française and a consultant in the Ministry of Education of the De Gaulle Government, on music and drama. Best known in the U.S. for the play *La Prisonnière* (*The Captive*). Died Paris, January 17, aged 58.

Bovard, Oliver K. Retired managing editor of the *St. Louis Post-Dispatch*. He had conducted campaigns against corruption in business and politics, helping to expose the "Teapot Dome" scandal and the Fendegast machine. Died St. Louis, aged 73.

Brandeis, Mrs. Alice G. Widow of Associate Justice Louis D. Brandeis of the U.S. Supreme Court. Interested in women's suffrage organizations, in the welfare of the underprivileged, in the alleviation of juvenile delinquency, and in the rights of labor. Vice-chairman of the Progressive League for Alfred E. Smith. Active in the World Zionist Organization and in the Jewish Agency for Palestine. Died Washington, D.C., October 11, 1945, aged 79.

Braun, Max. German editor. Attacked the Nazis from 1933 on, opposing in particular their occupation of the Saar Basin Territory. Losing his citizenship in 1936, he escaped to France, where he edited *News from Germany*, a political journal which contained information smuggled out of Germany. Died London, England, aged 52.

Brower, Charles D. Alaskan business man and author. Known as "King of the Arctic." Had accumulated fortune in the whaling trade. Friend of Will Rogers and Wiley Post, who were on their way to see him when their plane crashed, 1935. Author of *Fifty Years below Zero*. Died, Point Barrow, Alaska, February 12, 1945, aged 83.

Bryan, Charles N. Brother of William Jennings Bryan, he was defeated in 1924 as a candidate for the vice-presidency of the U.S., but he was elected governor of Nebraska three times. Attacked the gasoline, sugar, and coal trusts and effected substantial economies in state government. Died Lincoln, Nebraska, March 3, aged 78.

Buckner, Lt. Gen. Simon B. Commander of the U.S. Tenth Army. Born in Kentucky, the son of an officer of the Confederate Army; attended Virginia Military Institute and West Point, graduating from the latter, 1908, taught at West Point, 1919-23, and at the Command and General Staff School; Commandant at West Point, 1933-36, and Chief of Staff of the Sixth Division, 1939. In command of the Alaska Defense Force, July, 1940, he directed recapture of Aleutians, and died, June 18, in the conquest of Okinawa. Aged 61.

Bundy, Thomas Clark. Tennis star; with Maurice McLaughlin, three times national doubles champion. Died October 13, Santa Monica, Calif., aged 64.

Burgin, Edward L. British statesman. Minister of Transport, 1937-39, Minister of Supply, 1939-40, and a member of Parliament from 1929. He was also a philologist, an authority on archaic Greek, and the author of *Administration of Foreign Estates*. Died near Harpenden, Hertfordshire, England, August 16, aged 58.

Burke, Thomas. British novelist. Author of *Lighthouse Nights*, semi-autobiographical novel of his boyhood in the London slums. *Broken Blossoms*, a film produced by D. W. Griffiths, was based upon this book. Died London, September 23, aged 59.

Byas, Hugh. Newspaperman. Formerly employed by the *New York Times* and the *London Times* as Tokyo correspondent. Edited for a time *The Japan Advertiser*, wrote several books on Japan, and lectured on foreign affairs at Yale University. One of his best known books was *Government by Assassination*. Died New Haven, March 6, aged 70.

Cabot, Dr. Hugh (1872-1945). Surgeon. Dean of the medical school of the University of Michigan, 1921-30, and a member of the staff of the Mayo Clinic, 1930-39. Strong advocate of group medicine. Died near Ellsworth, Me., August 14.

Calder, Alexander S. (1870-1945). Sculptor. Numerous statues and monuments. "Lief Ericson," gift of U.S. to Iceland; "George Washington," in New York; the "Shakespeare Memorial," Philadelphia. Died Jan. 8, New York.

Calder, William M. Republican Senator. Active in real estate and building. Borough Commissioner of Brooklyn. In Congress sponsored first daylight-saving law, woman's suffrage amendment, and legislation dealing with housing and building materials. Died March 3, New York City, aged 76.

Calles, Gen. Plutarco E. Mexican statesman. Became prominent in 1911 as a leader in the revolution against

Porfirio Diaz. In 1919 he became Secretary of Industry, Commerce, and Labor under President Carranza; Minister of the Interior under President Obregon until 1924, and president 1924-28. His administration was notable for its improvement of laws pertaining to education, labor and agriculture. An opponent of the Catholic Church and an advocate of constitutional government. Opposed rule by military chieftains. Died Mexico City, October 19, aged 68.

Camacho, Gen. Maximino Avila. Elder brother of the President of Mexico. Once a cowhand and a bull-fighter, Gen. Camacho later became Secretary of Commerce. Career as a public figure began 1910, when he served as leader of the fifty-first cavalry regiment in the revolution and fought in 250 battles without experiencing a defeat. Died Puebla, Mexico, February 17, aged 52.

Cannon, Dr. Walter B. George Higginson professor of psychology at the Harvard Medical School since 1906. Author of *Bodily Changes in Pain, Hunger, Fear, and Rage*. An authority in the fields of psychology, endocrinology, and neurology. Discoverer of a hormone which he called "sympathin," he did much research on the treatment of shock. Died October 1, Franklin, N.H., aged 74.

Carlin, George A. Editor and general manager of the United Features Syndicate, Inc. Syndicated Drew Pearson, Westbrook Pegler, and Mrs. Franklin D. Roosevelt, among others. Died New York City, November 28, aged 55.

Cassel, Prof. Gustav (1866-1945). Swedish educator and adviser on finance to the Swedish Government. Critic of the gold standard and planned economy. Works: *Theoretical National Economics; On Quantitative Thinking in Economics*. Died Sweden, Jan. 14.

Cavigli, Marshal Enrico. Italian Senator and Minister of War, 1919. In 1920 he helped to defeat D'Annunzio's attempt to seize Fiume. Later, a consistent opponent of Fascism, he is thought to have plotted with Marshal Badoglio to remove Mussolini from office. Died Finale Marina, Italy, March 22, aged 83.

Chapman, Dr. Frank. Ornithologist. For fifty years curator in the American Museum of Natural History, New York City. Started the practice, since widely adopted, of exhibiting birds in their natural surroundings. The collection which he assembled for the museum numbers about 750,000 and is held to be the finest in the world. Also the founder and editor of *Bird Lore* and the author of many books on birds. Died New York City, November 15, aged 79.

Charlesworth, Hector W. (1872-1945). Canadian journalist and author. Chairman of the Canadian Broadcasting Commission, 1932-36. Created "Theater of the Air," and introduced many British programs. Died Toronto, Canada, Dec. 30.

Charnwood, Lord (Godfrey R. Benson). British biographer of Abraham Lincoln and Theodore Roosevelt and author of numerous detective stories. A member of the Liberal Party, he was elected to Parliament five times. Died London, England, February 5, aged 81.

Chernyakhovsky, Gen. Ivan D. Russian military leader. Commander of Third White Russian Army, the first to invade Germany. Tank expert who helped to direct the defense of Voronezh, 1942. Made a Hero of the Soviet Union for his part in the crossing of the Dnieper, 1943, heading part of the Third Ukrainian Front of Marshal Gregor Zhukov. At the time of his death his troops had taken virtually all of East Prussia and, with the aid of the Second White Russian Army of Marshal K. K. Rokossovsky, trapped the remainder of 20 German divisions below Koenigsberg. Died East Prussia, February 18, 1945, aged 37.

Clarke, John H. Retired Supreme Court Justice. Advocated international machinery for the insuring of peace. In 1918 he pleaded for a league of nations, and in 1921 he urged that war debts be cancelled as a gesture of international good will. An early opponent of prohibition, he later denied that the late President Roosevelt's proposal to enlarge the Supreme Court was contrary to the Constitution. Died San Diego, Calif., March 22, aged 88.

Clendening, Dr. Logan. Medical author and columnist. Wrote several popular books on medicine. *The Human Body, The Care and Feeding of Adults, Behind the Doctor*. Died Kansas City, Mo., January 31, aged 61.

Coburn, Charles. British singer and actor, well-known in the London music halls, he wrote and popularized many songs, the most famous of which was "The Man Who Broke the Bank at Monte Carlo." Died London, England, November 23, 1945, aged 93.

Colete, Mme. Jean. Polish scientist. Worked with Marie Curie at the Radium Institute in Paris, continuing Mme. Curie's research in radioactivity after the latter's death, 1934. Died late in January, 1945, Paris, aged 47.

Condon, Dr. John F. Schoolteacher. Became famous in 1932 as the intermediary in the Lindbergh kidnapping. Referred to at the time as "Jafie," he delivered a ransom of \$50,000 to a man called "John," whom he later identified at the trial as Bruno Richard Hauptmann. Died New York City, January 2, aged 85.

Connolly, Joseph V. President of King Features Syndicate, Inc., the International News Service, and Interna-

tional News Photos. Employed by Hearst in 1920, Mr. Connolly became within three years assistant manager of the Hearst syndicates and, in 1931, president of King Features. Directing the writing and distribution of news and comic features, he was responsible for the acquisition of many outstanding personalities in the field of journalism. Died New Rochelle, N.Y., April 18, aged 50.

Corbett-Smith, Major Arthur. British author and publicist. Died Margate, England, week of January 29, aged 65.

Craig, Gen. Malin. Former commandant of the Army General Staff College in Washington, D.C., and Army Chief of Staff, 1935-38. He directed many improvements in the Army while he was in this position. In 1941 he became active again as head of the personnel board of the War Department, and supervised the issuance of commissions to civilians. Died Washington, D.C., August 25, aged 70.

Craven, Frank. Actor, playwright, and director. Made his first successful appearance on the stage in 1911. In 1914 he wrote and acted in *Too Many Crooks*, which was followed by *Thru Way Out*. Then collaborated with John Golden on several plays, the best known being *That's Gratitude*. In Hollywood, he acted in many films, among which were the film versions of *That's Gratitude* and *Our Town*, and wrote numerous scripts. His last performance was in March, 1944, in Zoe Akins' *Mrs. January* and *Mr. Ez*. Died Beverly Hills, Calif., September 1, aged 65.

Crawford, Lindsay. Editor. First consul of the Irish Free State in U.S. and president of the Self-Determination League of Ireland, Canada, and Newfoundland. Died New York City, week of June 11, aged 76.

Crews, Marquess of (Robert Offley Ashburton). Retired British statesman. Son of the English poet, Richard Monckton Milnes. Served early in his career as Lord Lieutenant of Ireland. British Ambassador to France 1922-28, then Secretary for India, and, in 1931, Secretary of State for War. Died Leatherhead, Surrey, England, June 20, aged 87.

Crow, Carl. Author and editor. Founded and edited the Shanghai *Evening Post*. Opposed to Communism but not uncritical of the Kuomintang, he supported, for the most part, the policies and administration of Chiang Kai-shek. Best known work was *Four Hundred Million Chinese*, a best-seller in 1937, and his latest published work was *China Takes Her Place*. Died New York, June 10, aged 62.

Crown, James E. Editor of the *New Orleans States*. Conducted a campaign against the political machine established by the late Huey Long, being largely responsible for its overthrow, and urged the enforcement of the gambling laws. Died New Orleans, January 10, aged 72.

Cunningham, Capt. Harold A. Former commander of the *Leviathan* and Commodore of the U.S. Lines. Died New York City, aged 61.

Curtin, John. Australian statesman. Elected Prime Minister on the Labor Party ticket late in 1941. Helped to effect Australia's transition from peace to war. His problem was essentially that of enforcing strict control of the Australian economy and of persuading his Labor colleagues that nationalism was impracticable in an international emergency. Much credit is due him for the successful collaboration of Australia, Great Britain, and the U.S. in the prosecution of the war. Died Canberra, August 5, aged 60.

Darnand, Joseph. Chief of Vichy Militia. Collaborated with Nazis. Thousands of resistance workers tortured or killed by his militiamen and thousands of others sent to slave labor in Germany. Executed by firing squad, October 10, Fort de Chatillon, France, aged 47.

Davis, Dwight F. Statesman and athlete. National doubles champion in tennis, with Holcombe Ward, 1899-1901. While Secretary of War, under President Coolidge, he ordered the court martial of Col. William Mitchell. Under President Hoover, he was Governor General of the Philippines. The Davis Cup, symbol of international supremacy in tennis, was the gift of Mr. Davis. Died Washington, D.C., November 28, aged 66.

Davis, Fay (Mrs. Gerald Lawrence) (1872-1945). Actress. Popular in London and New York. Figured in Shakespearean roles. Died Exmouth, England, Feb. 26.

Dawson, Bertrand (Lord of Penn). English physician. Served Edward VII, George V, Edward VIII, and George VI. One of the few men of medicine to be elected to the House of Lords. Later appointed to the Privy Council, he was President of the Royal College of Physicians, 1931-38. Lord Dawson was noted for his progressive views on prohibition, divorce, and birth control. Died London, England, March 7, aged 81.

de Denterghen, Count André. Belgian diplomat. Ambassador to France, 1935-38 and Ambassador to Italy until 1940. Died Brussels, April 24.

de Forest, Prof. Alfred (1888-1945). Engineer and educator. Developed "magnafux test," for discovering defects in metals. Died Marlboro, N.H., Apr. 5.

Deland, Margaret W. Author of various novels dealing with social and religious issues. Her best known works were *Old Chester Tales* and *John Ward, Preacher*, which attacked fundamentalism in religion and the doctrine of

eternal damnation. Died Boston, Mass., January 18, aged 88.

de Moor, Dr. Johannes M. Dutch jurist and authority on shipping. Left Netherlands for England, 1940, when he became president of the Netherlands Navigation Council and president of the Netherlands Maritime High Court. Appointed Netherlands delegate on the United Nations War Crimes Commission, 1943. Died London, May 23, 1945, aged 49.

Denny, Harold. Correspondent of the *New York Times* for 23 years. Captured near Tobruk by the Germans in World War II, he had been employed previously on a variety of assignments which included the Nicaraguan incident, the war in Finland, the invasion of Ethiopia, and World War II. Of particular interest was his series of articles on the Russian trials, 1936-38. Died Des Moines, Iowa, August 8, aged 56.

Dentz, Gen. Henri Fernand. French military leader. Directed the defense of Syria against de Gaulle and British troops. Later convicted of aiding revolt against the British in Iraq, of yielding airfields in Syria to the Germans, and of asking for their assistance against the Allies. Died in Fresnes Prison, Paris, December 13, while serving a sentence of life imprisonment for treason, aged 64.

Donoghue, Stephen (Steve). English jockey who rode six Derby winners and won the Queen Alexandra stakes at Ascot six times in succession, reaching the height of his career in 1925. Retired from racing 1938. Died London, March 23, aged 61.

Doriot, Jacques. French Fascist Communist Deputy until 1935 and a member of the French National Council 1941-44. Founder of the French People's Party, a pro-Nazi organization, he wanted the Vichy Government to declare war on Great Britain and the U.S. His death was reported to have taken place in southwestern Germany on or about February 23, during an Allied air attack. Aged 57.

Dozier, Gen. Anton. First officer of the German General Staff to be tried before an American military commission on wartime charge. Convicted, October 12, of ordering the deaths of fifteen soldiers who were taken while they were on a mission for the Office of Strategic Services. His defense was that he had acted under pressure from Hitler. The importance of the case was that it might serve as a precedent against such a defense. The execution took place in Aversa, Italy, December 1.

Douglas, Lord Alfred. English author. A sensational witness in the defense of his friend, Oscar Wilde. The Marquess of Queensbury, Lord Alfred's father and framer of the boxing code, charged in his suit that Wilde had undermined the character of Lord Alfred, and the action resulted in Wilde's imprisonment. Lord Alfred's *Sonnets and Lyrics* was published in two volumes in 1935. Died Lancing, Sussex, England, March 20, aged 75.

Dreiser, Theodore. Novelist of realism. Wrote virtually without style, striving to present people, usually from the poorer classes, as convincingly as possible. Working variously as a laborer, newspaperman, and magazine editor, he achieved his first success with *Sister Carrie*, 1900. Other important works were *The Financier*, 1912, *The Titan*, 1914, *The Genius*, 1915, and *An American Tragedy*, 1925. Just before his death he completed two other novels, *The Bulwark* and *The Stoic*. Though he has never received the unqualified approval of all critics, his importance to American fiction is generally acknowledged. He was a source of encouragement and inspiration to many young writers after 1900. Died Hollywood, Calif., December 28, aged 74.

Easley, Brig. Gen. Claudius M. Assistant Commander of the 96th Infantry Division on Okinawa. Killed in action, June 19, aged 54.

Edwards, "Gus." Writer of popular songs and producer. Appeared in vaudeville at an early age and later became a theatrical agent, discovering and helping to develop talent among children. Among his proteges were George Jessel, Ray Bolger, Groucho Marx, Lila Lee, and Hildagarde. Best known songs "School Days," "By the Light of the Silvery Moon," and "In My Merry Oldsmobile." Died Los Angeles, Calif., November 7, aged 66.

Elles, Gen. Sir Hugh. British military leader. In World War I, as commander of a successful attack by 350 tanks in the Battle of Cambrai, he demonstrated the value of the weapon as a means of offense. Died London, England, July 11, aged 65.

Eno, William Phelps. Traffic expert. Devised the system of one-way streets and safety islands. Died Norwalk, Conn., December 25, aged 87.

Esselen, Louis. Statesman. Secretary of the United Political party and friend and confidant for many years of Jan Christian Smuts. Died Cape Town, Union of South Africa, week of March 26, aged 65.

Evans, Coradoc. Welsh author. Served on the staffs of several British publications and wrote satires of the Welsh which were well liked in some quarters but strongly resented by some of his readers in Wales. His works include *Taffy*, a play, *Pilgrims in a Foreign Land*, a book of stories, and *Morgan Bible and Waeps*, novels. Died in Aberystwyth, Wales, January 11, presumably aged 62.

Fairfax, Beatrice (Marie Manning Gosh). Widely syndi-

cated journalist whose column, "Advice to the Lovelorn," had a wide following. Started her column in 1898 with the assistance of the late Arthur Brisbane, then managing editor of the *New York Journal*; retired 1905; and resumed her career in 1929, becoming a feature writer for the *International News Service*. Died Washington, D.C., November 28, aged 70.

Farinacci, Roberto. Minister of State in Mussolini's government. Once a Socialist, he founded a daily newspaper, *Cremona Nuova*, in which he urged that Italy intervene in World War I. In 1919 he turned Fascist, changed the name of his newspaper to *Regime Fascista*, and agitated for the prosecution of Socialists, Jews, Catholics, and Freemasons. Serving as Secretary-General of the party, 1925-26, he was removed from office because he disapproved of Mussolini's recognition of the Vatican. In 1928 Farinacci became a member of the Fascist Grand Council and in 1938 Minister of State. Shot by Partisans in Milan on or about April 27, aged 53.

Ferguson, Dr. John C. Authority on Chinese art; educator, and newspaper publisher. Founder and first president of Nanking University and president of Nanyang College, now National Chiao Tung University. Publisher of *Sin Wan Pao*, a Shanghai newspaper, political adviser to the Chinese Government, 1915-28, and delegate, 1921, to the Washington Conference for the Limitation of Armaments. Died Clifton Springs, N.Y., July 3, aged 79.

Field, Sir Frederick L. English admiral. Active in Boxer Rebellion and in World War I, helping to direct the Battle of Jutland. First Sea Lord of the Admiralty and Chief of Naval Staff, 1930-33; Knight of the Bath, 1938. Recalled to active service in 1940. Died York, England, October 24, aged 74.

Fleming, Sir Ambrose. British scientist. Invented the diode valve, an early form of the radio tube, and worked out plans for a transmitting station in Cornwall from which, in 1901, the first transatlantic wireless communication was sent. Adviser to the Marconi Wireless Telegraph Co. Died Sidmouth, England, April 19, aged 96.

Flexner, Bernard. Zionist. Brother of Dr. Abraham Flexner, former director of the Institute for Advanced Study, and of Dr. Simon Flexner, former director of the Rockefeller Institute for Medical Research. Bernard Flexner served with the Red Cross during World War I in Rumania and Poland and became active with the Zionists in 1920. In 1924 he merged several relief committees into the Palestine Economic Corp. for the development of Palestine. Died New York, May 4, aged 80.

Fox, Dr. Dixon R. Historian. President of Union College. Former professor of history at Columbia University, head of American University Union in London, and lecturer. Died Schenectady, N.Y., January 30, aged 58.

Frank, Dr. Bruno. German playwright, poet, and novelist. Left Germany, 1933, and went to Hollywood, Calif., where he became a film writer. Two of best known plays are *Lost Heritage* and *A Man Called Cervantes*. Died Beverly Hills, Calif., June 20, aged 58.

Fraser, Leon. Financier. Varied career as reporter, teacher, soldier, lawyer, diplomat. As an expert in world finance, he became president of the Bank for International Settlements in 1933, and President of the First National Bank of New York in 1937. Died April 8, Comstock, N.Y., aged 46.

Fullerton, Hugh S. Baseball writer. Formerly an associate editor of *Liberty Magazine* and connected at various times with *The Tribune* in Chicago and with the *New York Evening World*. Famous for the accuracy with which he forecast the results of important games, he exposed the "fixing" of the World Series of 1919. He was also the author of numerous books and magazine stories. Died December 27, New Port Richey, Fla., aged 72.

Gilmore, Dr. Charles W. Curator of vertebrate paleontology for the National Museum and the Smithsonian Institution, Washington, D.C. Discovered the bones of *Diplodocus*, a dinosaur, 1923, and reconstructed the skeleton. President of Paleontology Society of America, 1938. Died September 27, Washington, D.C., aged 71.

Glasgow, Ellen A. Novelist of the South. Won the Pulitzer Prize, 1941 for her last novel, *In This Our Life*. Out of sympathy with those who desired a return to the traditions of the ante-bellum years, she was interested in current problems of her people. Her works include *The Descendant*, *The Rattleground*, *The Wheel of Life*, *The Builders*, *Barren Ground*, and *Vein of Iron*. Died Richmond, Va., November 21, aged 71.

Gless, Powell. Associate publisher and general manager of the *Lynchburg News and Daily Advance*. Eldest son of Carter Glass, dean of the U.S. Senate, he was active in civic and religious affairs and president of the Virginia Press Association. Died Richmond, Va., July 8, aged 59.

Goddard, Dr. Robert H. Scientist. His early experiments in rocket propulsion led to the completion of the jet-propelled plane and the "bazooka." Professor of Physics at Clark University until 1942, when he was employed to direct research on jet-propelled aircraft. Died August 10, Baltimore, Md., aged 63.

Goebele, Paul Joseph. Nazi minister for propaganda and national enlightenment. Took his doctorate in philosophy, 1921, at the University of Heidelberg. Became in-

terested in Nazism, 1924; edited the *Nationalsozialistische Briefe*, a journal run by Gregor and Otto Strasser, who were also in charge of the Nazi party in northern Germany. Met Hitler, 1926, abandoned his earlier, left-wing ideas and, 1927, founded his own newspaper *Der Angriff*. District party leader in Berlin, 1926. Elected to the Reichstag, 1928, and made propaganda leader, 1929. Helped to plan and execute the Reichstag fire in February, 1933. In November of the same year, organized the National Kultur Chamber, by which he extended his controls to include virtually the entire cultural life of Germany. Became a member of Hitler's Cabinet Council, 1938, and in 1944 was Reich trustee for total mobilization for war. His suicide at the age of 48 is thought to have taken place on or about April 29 in Berlin.

Gorrell, Col Edgar S. (1891-1945). Pioneer in aviation. President of Air Transport Association of America, 1936. Died Washington, D.C., Mar. 5.

Gould, Frank M. Vice-president and director of the St. Louis Southwestern Railway Co. Grandson of Jay Gould. Active sportsman; captain in the Army Air Corps, World War II, serving in administrative capacity, Atlanta, Georgia. Died January 13, Oyster Bay, L.I., aged 46.

Gould, Kingdon. Financier. Grandson of Jay Gould. Connected for a time with railroads controlled by his grandfather. Later president of the Arezzo Realty Co., New York City; also a mining engineer, sportsman, and stock broker. Died New York, aged 58.

Granach, Alexander. Polish-born actor. Took the title role in the anti-Nazi play *Professor Mamlock*, of which 300 performances were given in Poland. His first film role in the U.S. was in 1939, when he appeared with Greta Garbo in *Ninotchka*. His last role was that of Tomasino in John Hersey's *A Bell for Adano*. Died New York City, March 16, aged 54.

Grant, Heber J. Religious leader and businessman. For 26 years head of the Church of Jesus Christ of Latter-Day Saints. Once married to three women, he separated from two of them in 1890, when polygamy was forbidden by the Church. Founder and president of the Utah Home Fire Insurance Co., established in 1876, and director of several banks. Died May 14, Salt Lake City, Utah, aged 89.

Hacha, Emil. Former President of Czechoslovakia, succeeding Eduard Beneš, 1938, when the latter's resignation was required by the Nazis. Having ordered his countrymen not to resist the advancing Germans, he was rewarded for his collaboration by being made President of the Protectorate of Bohemia-Moravia. Died in a prison hospital in Prague, June 27, aged 71.

Halsey, Col. Edwin A. Secretary of the U.S. Senate after 1933 and Senate employee for 47 years. Known as "the 97th Senator." Died Washington, D.C., January 29, aged 62.

Hamson, Victor H. Publisher of *The Birmingham News* and *The Birmingham Age-Herald* and chairman of the board for both publications. Died March 7, Birmingham, Ala., aged 69.

Hardeen, Theo. Magician. Brother of the late Harry Houdini. Appeared with brother for many years and later had a part in *Hellzapoppin*, the musical show. President for many years of the Society of American Magicians. Died New York City, January 13, aged 69.

Harmon, Clifford B. Real-estate dealer and aeronautics enthusiast. Served in the Lafayette Escadrille in World War I. Later devoted much of his wealth to the cause of aviation and helped to establish the International League of Aviators, 1925, which has awarded annually the Harmon International Air Trophies for feats in balloons and airplanes. Died June 25, Cannes, France, aged 80.

Hay, Charles M. Former Special Assistant to U.S. Attorney General, to defend Railroad Retirement Act and counsel for Railway Executive Association in regard to legislation affecting retirement and unemployment insurance, and serving as executive director of the War Manpower Commission at time of his death. Died January 16, Washington, D.C., aged 66.

Herring, Clyde I. Governor of Iowa, 1932-36, and U.S. Senator, 1937-42. Supported the New Deal and advocated Federal censorship of radio scripts. President of Herring Motor Co. and the Herring-Wiawler Co. Died Washington, D.C., September 15, aged 66.

Hershey, Milton S. Industrialist. Experienced three failures before making a fortune in the caramel business. Sold this for \$1,000,000 and created out of the profits the Hershey Chocolate Corp., for which he later had constructed the town of Hershey, Pa. A philanthropist, he set up in 1918 the Hershey Industrial School for Orphan Boys, which he endowed with a fund of \$60,000,000. Died Hershey, Pa., October 13, aged 88.

Himmler, Heinrich. Chief of the German Gestapo. Committed suicide on May 23 in Luebnburg, Germany, swallowing cyanide of potassium as he was being examined by a British Army doctor. Arrested a short time before, Himmler was about to stand trial with other Germans charged as war criminals. Born in 1900, he joined the Nazi party, 1925, and was director of propaganda 1928-30. He became leader of the *Schutzstaffel* and a member of the Reichstag, 1930. He was appointed Chief of the

Gestapo, 1936, and in 1939 deputy head of the Reich administration. Shortly before his capture by the British he attempted to negotiate through the Swedish Government a separate treaty of peace which excluded Russia but provided for Germany's surrender in the West to Great Britain and the U.S.

Hitler, Adolf. Born at Braunau, Austria-Hungary, in 1889, of undistinguished parents. Opposed by his father, who refused to permit him to study painting, he was sent to an art school by his mother after the death of his father. Moved on to Vienna two years later, after the death of his mother. Had many disagreements with fellow-workers, most of whom were Socialists, and came under the influence of Karl Lueger, an anti-Semite who was head of the Christian Socialist Party and a strong factor in the early formation of Hitler's beliefs.

Unable to make any progress either in painting or in business, he welcomed the beginning of World War I as an opportunity to participate in the attempt to increase the power of Germany. After the war, during which he received an Iron Cross, he decided to enter politics. Ordered by some officers of the Bavarian Reichswehr to observe the operations of the German Workers' Party, he joined a small group which he attempted to use in an attempt to destroy the government of Bavaria. Sentenced to a term of five years, he served only nine months, in a prison in Landsberg, Germany, where he completed, with the help of Rudolf Hess, *Mein Kampf*. Joined by Goering, Goebbels, von Ribbentrop, Streicher, and Roehm, he formed the nucleus of the Nazi Party and won the support of important politicians, financiers, and industrialists.

Nazism grew swiftly. In 1928 the party had 12 seats in the Reichstag, in 1930, 107, and in 1932, 230. In January, 1933, Hitler was made Chancellor by President Paul von Hindenburg, and in June, 1934, when the Blood Purge took place, he became master of the Nazi Party and of the German state.

Internationally Hitler's progress was equally rapid. In 1935 he ordered the return of the Saar Basin Territory to Germany; in 1936 the Rhineland was retaken and the anti-Comintern pact signed with Japan. In March, 1938, Austria was seized, and in September of the same year, following Hitler's negotiations with Prime Minister Neville Chamberlain, the Sudetenland was given to Germany. In March, 1939, Hitler ordered the seizure of the rest of Czechoslovakia and in April demanded territory from Poland. Then, having formed the Axis with Italy, he signed a non-aggression agreement with Russia. A week later, in September, 1939, the invasion of Poland and World War II had begun.

According to the British report, Hitler committed suicide with his mistress, Eva Braun, whom he was reported to have just previously married, in private apartments in the Reichschancellery, April 30. He is thought to have shot himself and she to have poisoned herself. The bodies are said to have been burned in a nearby garden.

Holsti, Eino R. Finnish diplomat. Delegate to the League of Nations, 1927-40. Secured recognition of Finland's independence at the Paris Peace Conference, 1919. As Foreign Minister after World War I, procured assistance for Finland from Herbert Hoover. He was responsible, 1937, for Finland's resumption of relations with Russia, but in 1939, as Finnish delegate, he helped to effect ejection of Russia from the League of Nations because of her attack on Finland. Forced by the Nazis to leave Finland in 1940, he came to the U.S. and joined the teaching staff of Stanford University. Dr. Holsti is given credit for Finland's punctual retirement of her foreign debts. Died August 8, Palo Alto, Calif., aged 64.

Howe, Dorothy C. Golfer. Only woman to win all four of the most important women's golf championships. champion of Scotland, 1905, 1906, 1908; of Great Britain, 1909, 1911; of Canada, 1910, 1912; and of the U.S., 1909, 1910, 1924. Killed while boarding train, Yemassee, S.C., week of April 2. Aged 61.

Howell, Dr. William H. Scientist. Discoverer of heparin, which is extracted from the liver and used in the prevention of blood-clotting. Formerly dean of the medical school of Johns Hopkins, he later became director of the Johns Hopkins School of Hygiene and Public Health. Died February 6, Baltimore, Md., aged 85.

Hughes, Antoinette C. Wife of Charles Evans Hughes, retired Chief Justice of the U.S. Supreme Court. Member of the D.A.R., of the New York Chapter of the Society of Mayflower descendants, and of the New York Colonial Club. Died December 6, 1945, Washington, D.C., aged 81.

Hughes, Hatcher. Playwright. Became famous 1924 with his *Hell-Bent for Heaven*, with which he won the Pulitzer Prize. Taught playwriting at Columbia University for many years. Other plays: *It's a Grand Life*, *The Lord Blesses the Archbishop*. Died New York, October, aged 64.

Hughes, Mrs. Rupert. Third wife of Rupert Hughes, the writer. Known as an author under her maiden name, Elizabeth Patterson Dial. Died Hollywood, Calif., March 3, aged 42.

Huizinga, Prof. dohan (1872-1945). Dutch educator.

Professor of World History, University of Leyden, 1915. Seized as hostage by the Nazis, World War II. Author of *Erasmus, The Science of History, In the Shadow of Tomorrow*. Reported to have died in Netherlands, Mar. 22.

Hun, Dr. John G. Educator. Headmaster of the Hun School, which he founded in 1914. Former professor of mathematics at Princeton, he specialized in the preparation of pupils for that university. Died Trenton, N.J., September 15, aged 68.

Hunt, Lt. Joseph R. Tennis star. National singles champion in 1943. Finished course at Annapolis 1941. Killed when his plane crashed to the sea near Daytona Beach, Fla., February 2, aged 25.

Hunter, Glenn (1896-1945). Actor. Stage and film star. Outstanding success in *Merton of the Movies*. Died Dec. 30, New York.

Igoe, Bert A. (Hype). Writer and cartoonist for the Hearst newspapers, as a specialist in sports. Known for the accuracy with which he predicted the outcomes of sports events. Died New York, February 12, aged 68.

Jelliffe, Dr. Smith Ely. Psychiatrist and neurologist. Editor of *The Journal of Nervous and Mental Diseases* and of *The Psychoanalytic Review*. Opposed to the imprisonment of the criminally insane. Testifying at the trial of Harry K. Thaw for the murder of Stanford White, he was instrumental in the court's decision to have Thaw removed to a State hospital. Died Huletts Landing, N.Y., September 25, aged 79.

Jenkins, Dr. Burris A. Religious leader and educator. Headed a non-denominational community church in Kansas City, Mo., having served in the ministry for 54 years. Edited and published the *Kansas City Post* and published *The Christian*, a weekly journal. President of the University of Kentucky for 6 years. Died El Centro, Calif., March 13, aged 76.

Johnson, Eldridge R. Industrialist. Founder of the Victor Talking Machine Co. Introduced important improvements in the recording of sound and sold his interest in the business in 1926, reportedly for \$40,000,000. Backed archeological expeditions to Easter Island and Guatemala and gave a fund of \$1,000,000 to the University of Pennsylvania for medical research. Active in the Republican Party, he was the largest individual contributor to the Republican National Committee in 1943. Died Camden, N.J., November 14, aged 78.

Johnson, Hiram W. Statesman. Important figure in American politics since 1912, when Theodore Roosevelt selected him to run for the vice-presidency on the Bull Moose ticket. Republican Governor of California. Elected to the Senate in 1917, where he opposed U.S. participation in international affairs. Fought the Four-Power Pact, the London Naval Treaty, the revised neutrality act, and assistance to Great Britain. Thought to have been chiefly responsible for the failure of Charles Evans Hughes to win the presidency in 1916. In bitter disagreement much of the time with Presidents Wilson, Harding, Coolidge, and Hoover. Supported the late President Roosevelt for a time in some of his policies but broke with him in 1937 over the bill for the reorganization of the Supreme Court. Died Bethesda, Md., August 6, aged 79.

Johnson, William E. Advocate of prohibition. Employed by the U.S. Indian Service, he was nicknamed "Pussy-foot" because of his catlike pursuit of lawbreakers. Went on a world tour in 1919 during which he attempted to win converts to his cause. Died Binghamton, N.Y., February 2, aged 83.

Kaiser, Georg. German novelist and playwright. Pioneer in expressionist drama. Driven out of Prussian Academy of Art, 1933, along with Thomas Mann and Franz Werfel. His plays include *Der Protagonist*, *Adrienne Ambrosart*, and *Morgen bei Mitternacht* (*From Morn till Midnight*), which was produced in New York. Died Ascona, Switzerland, June 5, aged 67.

Kallish, Max. Sculptor. Made reputation 20 years ago with figures of American working men. Engineering and industry the themes which interested him. Typical subjects: the riveter, the telephone lineman, the lumberjack, the foundry worker, the athlete. Chief works: "Man of Steel," National Gallery of Art, Washington, D.C.; "The Christ" and "Torso," Cleveland Museum of Art; "Ecstasy" and "Laborer," Canajoharie (N.Y.) Museum of Art; "Man of Power," Amherst College Museum. Died March 18, New York, aged 54.

Kan-in, Field Marshal Prince Kotohito. Japanese statesman. Member of the Privy Council and honorary president of the Japanese Red Cross. Chief of the Army General Staff, 1931-40. Former president of the Japan-France Institute and of the Japan-Russia Society. Largely inactive or neutral in politics. Close friend of Emperor Hirohito. Died Japan, May 20, aged 80.

Kern, Willard S. Contract bridge authority. Won the national individual title 1931. Won team titles with Hal Sims and others. Known as one of the "four horsemen" of contract bridge. Died New York, April 28, aged 47.

Kaufman, Beatrice B. Writer and wife of George S. Kaufman. Author of two plays, *The White-Haired Boy* and *Divided by Three*. Died New York, October 6, aged 50.

Keane, Doris. Actress. Famous in the role of Margherita Cavallina in *Romance*, 1918. Leading roles in *Romeo and*

Juliet, 1919, and *The Czarina*, 1922. Popular in London and New York. Died New York, November 25, aged 64.

Kemmerer, Dr. Edwin W. Monetary expert. Financial adviser to 14 governments engaged in reorganizing their monetary systems. Known as the "money doctor." Managing editor of *The Economic Bulletin* and president of the Economists National Committee. Walker Professor of International Finance and director of the International Finance Section of Princeton University. Banking expert to the Dawes Committee when it prepared the Dawes plan for handling German reparation payments. Defended gold standard, advocated reduction of Federal expenditure for unemployment relief, and opposed the Bretton Woods monetary proposals. Author of *The ABC of the Federal Reserve System*. President of American Economic Association and member many learned societies. Died Princeton, N.J., December 16, aged 70.

Kern, Jerome. Composer of musical comedy hits since 1912. Best known compositions were "Make Believe," "Smoke Gets in Your Eyes," "The Way You Look Tonight," and "Ol' Man River." Composed scores for *Show Boat*, *The Cat and the Fiddle*, *Muscle in the Air*, and *Roberta*. Several of his songs achieved international popularity. His latest score was for *Can't Help Singing*, with Deanna Durbin. Died New York, November 11, aged 60.

Keyes, Lord Roger. British naval hero. Commander of the Dover Patrol in World War I. Helped to plan and execute the attack on Zeebrugge, Belgium, by which the Bruges Canal was closed. Returned to active service in 1939. Director of Combined Operations, 1940-41, organizer of the Commandos. Member of Parliament, Conservative, 1935-43. Died December 26, Buckingham, England, aged 73.

Kiefer, Commodore Dixie. Naval hero of the Pacific. Executive officer of the aircraft carrier *Ticonderoga* in battle off Formosa. Commodore Kiefer appeared as Captain Dixie in the documentary film, *The Fighting Lady*. Killed November 11 in a plane crash in the Fishkill Mountains, N.Y., aged 49.

Knoblock, Edward. British playwright, born in the U.S., who spent most of his time in England and ultimately became a British subject. His plays include *Kismet*, *Milestones*, and *Grand Hotel*, a dramatization of the novel by Vicki Baum. Wrote numerous films for Hollywood, collaborating with Mary Pickford and Douglas Fairbanks on *The Three Musketeers* and *The Thief of Bagdad*. Died London, August 19, aged 71.

Knobel, Rev. Dr. Frederick H. President of the United Lutheran Church thirteen times in succession. Founder and pastor of the Church of the Atonement and president of the Lutheran World Convention. Died New Rochelle, N.Y., October, aged 75.

Koenigsberg, Moses. Journalist. President of King Features, International News Service, and other Hearst organizations. Received French Legion of Honor Medal 1928. Later resigned positions with Hearst because of latter's ruling that none of his employees might be decorated by a foreign government. Died New York, September 21, aged 67.

Konoye, Prince Fumimaro. Japanese premier. Born in 1891, son of Prince Atsumaro Konoye, of the Fujiwara nobility. At Paris Peace Conference, 1919, as companion of Prince Saionji. Elected president of House of Peers, 1933; Foreign Minister, 1938; Premier, 1937-39, 1940-41. Claimed role of peacemaker. Alleged to have contemplated trip to Moscow last summer to terminate Japanese participation in the war. Poisoned himself December 16, Tokyo. Left note in which he took responsibility for the war against China and declared that he could not endure the disgrace of being tried by an American court.

Kramer, Josef. Nazi commandant of the concentration camp at Belsen, Germany. Sentenced to be hanged, November 17, for murders and atrocities committed under his authority. Sentence executed December 13 at Hameln, Germany.

Krofta, Kamil. Czechoslovakian Foreign Minister, 1936-38. Aide to Eduard Benes; former Minister to Vatican, Austria, Germany. Foreign Minister, 1936-38. Died, August 18, in sanitarium, Prague, after release from Nazi concentration camp, aged 69.

Lake, Simon. Inventor. Developed first modern submarine. Sold submarine to foreign countries because U.S. was not interested until just before World War I. Invented even-keel type of submarine torpedo boat and underwater sea salvage apparatus. Became impoverished, largely because of costly treasure-salvage ventures. Died Bridgeport, Conn., June 3, aged 79.

Lang, Cosmo Gordon. Prelate of Anglican Church. Born Aberdeenshire, Scotland 1901-1908, Bishop of Stepney and Canon of St. Paul's; 1908-1928, Archbishop of York; 1928-1942, Archbishop of Canterbury. Member of the House of Lords and of the royal commission on divorce. Supported the revised Prayer Book and worked for interdenominational unity. Opposed marriage of Edward VIII to Mrs. Simpson, and was believed to have been instrumental in the King's abdication. Died December 5, Richmond, England, aged 81.

Lanier, Charles Day. Eldest son of the poet-musician, Sidney Lanier. Writer, editor, and publisher of *American*

Review of Reviews. President of Mohawk Mining Co. Horseman, gunner, angler, and trainer of sporting dogs. Father elected to New York University Hall of Fame, October, 1945. Died Greenwich, Conn., November 17, aged 77.

Larson, Col. Emory E. ("Swede"). Football coach at Naval Academy, Annapolis, 1938-41. Saw action in Pacific, World War II. Died Atlanta, Georgia, November 7, aged 46.

Laval, Pierre. French collaborationist, executed by firing squad, October 15, in Fresnes Prison, Paris. A few hours before his execution, he attempted to kill himself by swallowing poison, but was resuscitated. Born in 1883, Laval was elected to the Chamber of Deputies as a Socialist, 1914, in 1924, re-elected as a Republican. Held important posts in various cabinets, becoming Premier 1931. Arranged with Pres. Hoover a moratorium on reparations. Concluded with Sir Samuel Hoare an agreement, 1936, the Hoare-Laval Treaty, which ceded Italy a large section of Ethiopia. By 1939 a zealous exponent of peace at any price and of full cooperation with Germany. April, 1942, succeeded Admiral Jean-François Darlan as Premier in the Vichy Government, and maintained a policy of collaboration until his execution.

Laverne, Lucille (1872-1945). Actress. Star of many hits in London and New York. Best known in role of Widow Cagle in Lulu Vollmer's *Sun-Up*. Died Hollywood, Calif., Mar. 6.

Lea, Col. Luke. Industrialist. Controlled many banks and newspapers during the twenties, but suffered severe losses in 1929. Attracted much attention shortly after World War I, when he made an unsuccessful attempt to kidnap Kaiser Wilhelm from Doorn. U.S. Senator at 40. Imprisoned for bank fraud, 1934. Died November 18, Nashville, Tennessee, aged 66.

Lee, Vice Admiral Willis A. With Admiral Marc A. Mitscher, directed attack on Truk and other points in the Carolines. Best known for direction of action off Guadalcanal. With only two battleships and few destroyers, Admiral Lee opposed a Japanese force which, scout planes reported, constituted the entire Japanese fleet. Died August 25, Casco Bay, Me., aged 57.

Lehman, Irving. Chief Judge of the New York State Court of Appeals. Liberal interpreter of the law. President of the Young Men's Hebrew Association. Active in religious organizations. Wrote the unanimous opinion of the court in the case of Carmen Barber, member of Jehovah's Witnesses, who had been convicted by the U.S. Supreme Court of distributing and attempting to sell religious materials without a license. Judge Lehman's decision reversed the conviction. Died September 22, Port Chester, N.Y., aged 69.

Ley, Robert. Violent anti-Semite and former leader of the Labor Front in Germany. Hanged himself in his cell, October 25, while awaiting trial in Nuremberg as a war criminal. Born in 1890, he entered the Nazi Party, 1924, and was placed in charge of the Rhineland. Became a Nazi deputy, 1938, and leader of the party in Munich, 1931. In 1932, succeeded Gregor Strasser in command of the entire organization in Germany, and was elected to the Reichstag. From 1933 on, directed the Labor Front, controlling 25 to 30 million workers and exacting absolute obedience to his orders. Edited *Westdeutscher Beobachter*, organ of Nazism in western Germany. Captured in Austria, May 16.

Liddell, Rev. Eric. Missionary to China. Appeared in the Olympic Games in Paris, 1924. A theology student at the time, he declined to run on Sunday but set a world's record the following Monday, running the 400-meter dash in 47.6 seconds. Died May, aged 44, in a Japanese internment camp.

Lindsay, Sir Ronald. British Ambassador to the U.S. 1930-39. Began career as diplomat in 1905, when he served as attaché. Later served in Istanbul, Berlin, and Washington. Important in securing Anglo-American unity through trade pacts. Died August 8, Bournemouth, England, aged 68.

Lloyd George, David. British statesman and former Prime Minister. Born in 1863 and elected when he was 27 to the House of Commons. A radical opponent of wealth and privilege, attacking royalty, landlords, the liquor interests, capitalists in general, and the Church of England. Chancellor of the Exchequer 1908, when he sponsored the People's Budget, making drastic increases in the taxation of great wealth. Later supported the Parliament Bill of 1911, which limited sharply the power of the House of Lords. Became Prime Minister, replacing Asquith, shortly after the beginning of World War I, when he assumed control of virtually all ministries. Instrumental in the entrance of the U.S. into the war and in the appointment of Marshal Foch as commander of all Allied military forces. Kept in office by a general election which he called for after the armistice, he attempted throughout the treaty settlement at Versailles to mediate between the two extremes represented by Wilson and Clemenceau. At about the same time factions developed within his government over the problems of settling the national strike of 1919 and of removing the threat of war with Turkey. Conferred with Irish leaders in

1921, helping to create the Irish Free State, and retired from office October 19, 1922. A short time before his death he received the title of David, 1st Earl of Dwyfor. Died March 26, Llangatundwy, Wales.

Lopez, Encarnacion (Argentine). Dancer. Born Buenos Aires, educated Spain. Organized the Madrid Ballet, 1932, with the late Garcia Lorca. Famous for performance in *The Three-Cornered Hat*, with Leonide Massine. Appeared in *Priorities of 1942*. Died New York, September 24, aged 47.

Lumsden, Lt. Gen. Herbert (1897-1945). British military leader. Special representative of Great Britain with General Douglas MacArthur. Killed in air attack Jan. 6 on U.S. warship in Pacific.

McCain, Vice Admiral John S. Commanded naval aircraft in the South Pacific, 1942. Later, under Admiral Halsey of the third fleet, in charge of Naval Operation for Air, and the Bureau of Naval Aeronautics Head of Task force 38, he carried war to Japan, approaching mainland at end of war. Died September 6, Coronado, California, aged 61.

McCloy, Lt. Com. John. Naval hero. One of eight men to receive Congressional Medal of Honor twice. Awarded it first for heroism in the Boxer Rebellion, 1900, and second for his bravery in an attack on the Customs House, Vera Cruz, 1914. Aged 69.

McCormack, John. Irish tenor. Born of poor parents, he became most famous of all Irish ballad singers 1907, made debut at Covent Garden in *Cavalleria Rusticana*; first U.S. appearance, 1909, at Manhattan Opera House in *La Traviata*. Later with Chicago Grand Opera Co., Metropolitan Opera Co., Monte Carlo Opera Co. Became U.S. citizen, 1919. Died September 16, Booterstown, near Dublin, Eire, aged 61.

MacDougall, Alice Foote. Operator of restaurants and author of cookbook. Started business with capital of \$38 and developed an organization whose receipts were at one time about \$2,000,000. Entrusted the business to other persons, 1930, under whose management it went into the hands of the receivers in 22 months. Resumed control of the business later, putting it back on a paying basis. Died New York, February 10, aged 78.

MacRory, Joseph, Cardinal. Irish religious leader. Opposed stationing of British and American troops in Ulster during World War II. Defended Irish neutrality and opposed conscription in Ulster counties. Was descended from "the Burderries," an Irish clan whose members revolted against British rule in 1608 and destroyed Londonderry. Died October 13, Armagh, Northern Ireland, aged 84.

Maier, Premier Ahmed (Pasha). Egyptian statesman. Headed the Cabinet, October, 1944, succeeding Mustafa Nahas Pasha, who was removed from office by King Farouk. A moderate in his views, wanting sovereignty but believing that no changes could be made until the end of the war. Shot and killed February 24 in Parliament as he was reading Egypt's declaration of war against Germany and Japan, aged 57.

Mallaby, Brig. A. W. Commander of British troops in Surabaya, Java. Killed October 30, by Indian nationalists as he was about to confer with the leaders.

Maloney, Francis T. Prominent Democrat, Senator from Connecticut. Supported much progressive legislation under New Deal, and shortly before his death prepared a bill intended to improve Congressional procedure. Starting as counterman in a luncheon, he became city editor of the *Meriden Record*, Mayor of Meriden, Congressman, and Senator. Died January 16, Meriden, Conn., aged 51.

Margot, Countess of Oxford and Asquith. British author. Married Herbert Asquith, Prime Minister of England, during World War I and came to know and write about most of the English celebrities of her day. Descriptions of them noted for frankness. Her works included *More or Less about Myself* and *Off the Record*. Died London, England, August 28, aged 81.

Marks, Edward B. Music publisher. President of the Edward B. Marks Music Corp. and publisher of nearly 20,000 songs, including some of the work of Jerome Kern, Sigmund Romberg, and Rodgers and Hart. Most famous were "A Hot Time in the Old Town Tonight," "Ida, Sweet as Apple Cider," "My Gal Sal," and "Parade of the Wooden Soldiers." Died Mineola, L.I., December 17, aged 80.

Mariott, Sir John A. English historian. Authority on the Victorian period and English constitutional law. Member of Parliament, Conservative, and Fellow of Worcester College, Oxford. Works included *Makers of Modern Italy*, *George Canning and His Times*, and *English Political Institutions*. Died Llandindod, Wales, June 7, aged 86.

Mascagni, Pietro. Italian composer. Known mainly for his *Cavalleria Rusticana*. Other works included symphonic compositions and church and chamber music. Other operas were *Iris*, *Le Maschere*, and *Isobel*. Last work, 1935, was *Il Nerone*. Collaborationist under Fascist rule. Died Rome, August 2, aged 82.

Mercer, James (Sid). Writer. Expert on baseball. Columnist on *The New York American*. Founder of Baseball Writers Association of America. Died New York, June 19, aged 64.

Merriam, Dr. John C. Paleontologist. President emeritus of the Carnegie Institution of Washington, of which he had been director for eighteen years. In charge of numerous explorations. Important study of the Mayan civilization in Mexico. Author of many scientific works: *Cave Exploration, Science in Mobilization, Science and Human Values, Ultimate Values of Science*. Died Oakland, Calif., October 30, aged 76.

Monaco, James V. Composer of popular songs. Most recent success was "Six Lessons from Madame La Zonga." Earlier successes were "You're Gonna Lose Your Gal," "If I Had My Way," and "You Made Me Love You." Songs featured in several films. Died Beverly Hills, Calif., October 16, aged 60.

Moncada, Gen. José María. Statesman. President of Nicaragua, 1929-33. Minister of Government, 1944. Died Nicaragua, Feb. 23, aged 76.

Morgan, Dr. Thomas H. Scientist. Research on fruit-fly led to formulation of theory of genes as heredity determinants. Awarded Nobel Prize in 1933 for studies in genetics. Professor of Biology at California Institute of Technology. Author of *Evolution and Adaptation, Experimental Zoology, and Embryology and Genetics*. Died Pasadena, Calif., December 4, aged 59.

Morisco, Oliver. Theatrical producer. Began career as acrobat. Earliest successes were *The Bird of Paradise* and *Peg o' My Heart*. Many productions followed until 1927. Experienced financial reverses and became involved in extensive litigation. Lost fortune and control of theaters in California and New York. Died Hollywood, Calif., August 25, aged 69.

Moses, Sen. John. Senator from N.D. First Democrat to represent this State in the Senate, having defeated Gerald P. Nye in the fall election of 1944. Also Governor of North Dakota three terms. Died Rochester, Minn., March 3, aged 60.

Mussolini, Benito. Italian dictator summarily executed with his mistress, Clara Petacci, and sixteen other Fascists by Partisans, April 28, near Milan. The bodies were removed to a square in Milan, where Mussolini had founded his movement, and two days later were buried secretly in the potter's field section of the Magiore cemetery.

Born in the province of Forlì, Italy, in 1883, Mussolini studied in Switzerland, from which he was expelled because of his radicalism. Edited *Avanti*, Italian Socialist newspaper, 1912-14. Started own newspaper, *Il Popolo d'Italia*, which urged that Italy enter the war on the side of the Allies. After Italy entered the war, he enlisted in the Italian Army, serving as a private until February, 1917, when he returned to his position as editor of *Il Popolo d'Italia*. Campaigned against Communism and organized his *Fascio di Combattimento*, March, 1919. Led his followers in march on Rome, 1922. Asked by Victor Emmanuel to form new government when the Facta Cabinet resigned. Mussolini then assumed control of several ministries, changed the electoral laws, and suppressed all opposition. First crisis June, 1924, when Giacomo Matteotti, a Socialist and virtually the only politician who openly defied the dictator, was kidnapped and murdered by Fascists. Indignation blazed over this murder, but the Duce, after giving the Socialist leader a military funeral, introduced even stronger measures, assuming control of capital and labor, fixing wages and hours, limiting profits, prohibiting strikes, and subjecting professional and agricultural workers to Fascist codes. Signed treaty, 1929, with the Pope by which the sovereignty of the Vatican City was recognized.

Ordered invasion of Ethiopia, 1935, in the face of opposition by Great Britain and the League of Nations, and sent Italian troops to support Franco in Spain. Repudiated the League of Nations, 1937, because it had attempted to impose sanctions against Italy during the Ethiopian campaign. Established a corporative state in Italy, 1937, and discontinued, 1938, the Chamber of Deputies. After Munich, 1938, he joined Hitler, forming the Axis, and the following year annexed Albania.

He declared war against the Allies in June, 1940. A few successes were achieved against the British in North Africa, but by the end of 1942 defeat was imminent. Removed from office July, 1943, as a temporary government, headed by Marshal Pietro Badoglio, prepared to negotiate an armistice with the Allies. Mussolini's escape from jail, with the assistance of the Germans, followed, and his formation of the "Republican Fascist Government." He then had executed Count Ciano, his son-in-law, Marshal de Bono, and others who had been immediately responsible for his downfall. Mussolini was arrested as he was on his way from Italy into Switzerland.

Nemceva, Alie. Russian actress. Born in Crimea in 1879, the daughter of a chemist. Studied music in Switzerland and Odessa, becoming proficient enough to play first violin under Tchaikovsky and Rimski-Korsakov. Interested in the theater when she was seventeen and coached by Stanislavski. First appearance in New York, 1905, following tours of Europe. Signed contract with the Schuberts and given a role in *Hedda Gabler*, in which she was so successful that she was given many other roles in Ibsen and became a leading interpreter of him. Later appeared in films, *War Brides* and *Salome*. Re-

turned to the stage, 1928, in production by Eva Le Gallienne of Chekhov's *The Cherry Orchard* and O'Neill's *Mourning Becomes Electra*. Died Hollywood, Calif., August 13.

Neumann, Wladyslaw. Polish statesman and Minister to Mexico. Minister to Norway 1931-42, leaving when it was occupied by the Germans and proceeding to London, where he served as Minister from the Polish Government-in-Exile to the Norwegian Government-in-Exile. Appointed to his post in Mexico 1942. Died New York, January 24, aged 52.

Neurath, Dr. Otto (1882-1945). Viennese sociologist. Inventor of the isotype method of presenting statistics. Editor of *The International Encyclopedia of Unified Science*. Died at Oxford University, England, Dec. 22.

Newberry, Truman M. Secretary of the Navy under Theodore Roosevelt. Elected to Senate 1918 over Henry Ford. Convicted of electioneering but acquitted by Supreme Court. Resigned seat in Senate. Died Grosse Point, Mich., aged 81.

Nichols, John C. Vice-president of Transcontinental and Western Airlines, Inc. Congressman from Oklahoma, 1935-45. Manager of international operations for T.W.A. Killed, Nov. 7, while making a survey flight from Asmara, Eritrea, to Addis Ababa, Ethiopia. His plane, an Army B-25, crashed. Aged 49.

Noek, Albert Jay. Critic, essayist, historian. Edited *Freeman* magazine and contributed many articles to the *Atlantic Monthly* and the *American Mercury*. Trenchant critic of the New Deal. Disliked labor unions, universal suffrage, free public libraries, newspapers, and other expressions of democracy. Author of *Our Enemy the State* and *Memoirs of a Superfluous Man*. Died Wakefield, R.I., August 19, aged 72.

Norfolk, Dowager Duchess of (Gwendolen Mary). Mother of present Duke of Norfolk, Parliamentary Secretary of Foods during World War II. Startled England, 1929, by attempting to exact feudal payments from tenants living on her property in Scotland. Died August 28, aged 68, on her estate near Gretna Green, Scotland.

Norris, Charles G. Novelist. Husband of Kathleen Norris, writer of numerous best-sellers. An internationalist in foreign affairs and a Republican, whereas his wife was an isolationist and a Democrat. Author of several novels, most of them controversial in subject matter. *Brass, Seed, Bread, Bricks without Straw*. Died Palo Alto, Calif., July 25, aged 64.

Norton, William W. Publisher. President and editor in chief of W. W. Norton & Co., Inc. Specialized in textbooks until 1927, when he began to include books on art, architecture, and literature. Best sellers handled by the company were *Mathematics for the Million*, *An American Doctor's Odyssey*, and *Burma Surgeon*. Fiction published after 1929. Died New York, November 7, aged 54.

Noyes, Alexander D. (1862-1945). Journalist. Financial editor of *The New York Times*. Author of a financial history of U.S. Believer in "sound money." Died Apr. 22, New York.

O'Hara, Fiske. Singer and actor. Appeared in *Robin Hood* and many other Broadway productions. Acted in films, having a part in *Change of Heart*. Best known for his rendition of Irish ballads. Died August, Hollywood, Calif., aged 67.

Oreamuno, Ricardo J. Statesman of Costa Rica. Held many important posts in diplomacy and in various departments of the government. President of the Congress of Costa Rica and of the Supreme Court. Elected President of Costa Rica in 1910, 1924, and 1932. Died San José, Costa Rica, January 4, aged 85.

Oumansky, Constantine. Soviet Ambassador to Mexico and Central America and formerly Ambassador to the U.S., 1939-41. Veteran of the revolution of 1917. Position in the U.S. complicated by the Russo-Finnish war. Sent to Mexico to win good will and recognition for the Soviet Union from the Latin American nations. Killed in plane accident in Mexico City, January 25, aged 43.

Partridge, Sir Bernard. British cartoonist for *Punch*. Joined the staff of the magazine 54 years ago. Quiet humor and forceful, realistic drawing. Had worked in water color and oils. Knighted, 1925, for his work. Professor of Anatomy at the Royal Academy. Died London, England, August 10, aged 84.

Patch, Lt. Gen. Alexander M. Commander of the U.S. Seventh Army in France and Austria. Led troops, 1943, in the Guadalcanal campaign. Just before his death he was appointed head of a board to determine the size and nature of the postwar forces of the U.S. Died San Antonio, Texas, November 21, aged 56.

Patton, Gilbert (Burt L. Standish). Author of the Frank and Dick Merriwell books, adventure stories for boys. Total writings thought to approximate 40 million words. Sold first story when he was 17 and found position with a firm of "pulp-fiction" publishers. Sold the Merriwell stories outright to Street and Smith, none bringing more than \$150. In financial difficulties, 1940, and joined son in California. Completed, 1941, *Mr. Frank Merriwell*, a novel which described his hero as a man advanced in years. Died Vista, Calif., January 16, aged 49.

Patton, General George, Jr. Military leader. Won great fame as Commander of the Third Army in Africa,

France, and Germany. Born in 1885, he entered Virginia Military Institute when he was 18 and proceeded to West Point one year later, joining the cavalry after graduation from the Academy. Early advocate of the tank, he put his ideas into practice during World War I by establishing at Langres, France, a tank school for the training of American soldiers. Then led the 304th tank brigade in the St. Mihiel and Meuse-Argonne offensives. Between the wars advanced from captain to major-general. Dispersed the Bonus Army in Washington, 1932. Trained the Second Armored Division, 1940. Placed in charge of the First Armored Corps, and leader of the Second Corps in French Morocco, November, 1942. Led the Seventh Army to victory over the Germans in North Africa, 1943. Widely criticized, November, 1943, for slapping a soldier suffering from battle fatigue. Later made public apology for action.

He was made Commander of the Third Army, in Normandy, shortly after D Day. Led his troops across France to Metz and the Moselle River, 1944. Brought his troops up from the south to remove the dangerous German salient in the Ardennes.

He was relieved of his command of the Third Army, October, 1945, because of his disposition to use former Nazis as administrators. On December 9 his sedan collided with an Army truck just north of Mannheim, Germany, and he suffered a broken neck. His death, resulting from congestion of the lungs, took place December 21 in an Army hospital in Heidelberg. He was buried at Hamm, Luxembourg.

He had led his troops through six countries and across six major rivers and had been responsible for the capture of approximately 750,000 Germans and for the death or incapacitation of about 500,000 more. A daring tactician, he planned his campaigns carefully and took care not to expose his troops unnecessarily.

Pavolini, Alessandro. Italian Secretary of State, executed with Mussolini on April 28 by the Partisans. A veteran of the party, he had participated in the march on Rome in 1922, and was Secretary of the Fascist Provincial Confederation, President of Confederation of Fascist Professions and Arts, President of the National Institute for Cultural Relations with Foreign Countries, and, 1939-43, Minister of National Enlightenment. His function here was similar to that of Joseph Goebbels under Hitler in Germany, to suppress individual opinion and force the press to publish only the government's interpretation of news. Aged 42.

Pendergast, Thomas V. Democratic politician from Missouri, son of Irish immigrants. Starting as cashier in a saloon, he progressed from small posts in the local government to the position of "political boss." Controlling patronage, his authority in the State of Missouri was virtually unquestioned. In 1939, the Federal Government found him guilty of tax evasion to the extent of \$443,550; sentenced to a term of one year and three months in Leavenworth Penitentiary, he was released under probation, 1940, having served a year and a day of his sentence. His political organization, which his nephew attempted to maintain, retained only a fraction of its original power. Credited with starting the career of President Harry Truman. Died January 26, Kansas City, Mo., aged 75.

Phippis, Sir Eric (1875-1945) British statesman. Ambassador to Germany, 1933-37, to France, 1937-39. Early prophet of war with Germany. Died London, England, Aug. 13.

Pratt, Frederic B. Brooklyn educator. For many years head of Pratt Institute, established by his father, Charles Pratt, co-founder with John D. Rockefeller, of the Standard Oil Company. Established Museum of Science and Industry at 30 Rockefeller Plaza, served as president 1928-35. Active in real estate and a member of many societies. Died Glen Cove, L.I., May 3, aged 80.

Pratt, Herbert L. Sportsman and multimillionaire. Formerly chairman of the board, Socony-Vacuum. Started as clerk with the Standard Oil Co. Advocated improvement of working conditions by means of pensions, insurance, and shorter hours for the employees. Died February, New York, aged 74.

Pueyrredon, Honorio. Argentine statesman. Former Foreign Minister and Ambassador to Washington. Foreign Minister under President Hipolito Irigoyen during World War I. Helped to maintain Argentine neutrality throughout. Headed Argentine delegation to the sixth Pan-American Congress at Havana, Cuba, 1928, withdrawing because the Congress refused to adopt a reciprocal tariff proposal of Irigoyen. Defeated as Radical candidate for Governor of the province of Buenos Aires, 1935. Died Buenos Aires, September 23, aged 73.

Pyle, Ernie. War correspondent and columnist; Pulitzer Prize winner. Killed instantaneously by machine gun fire on Ie Shima, about 8 miles west of Okinawa. Born in 1900 on a small farm in Dana, Indiana, he left home at 18 to enter the School of Journalism at Indiana University. Leaving in his last year, he worked on several newspapers and in 1925 married Miss Geraldine Siebolds. Worked successively on the N.Y. *Evening World*, the N.Y. *Post*, and the Washington *Post* on which he became managing editor. Assigned to conduct Heywood Brown's column in the latter's absence, Pyle wrote simple, chatty descriptions

of auto tours which he had taken with his wife and so impressed the editor in chief that he was assigned to travel about the country and record his observations. Went to England, 1940, and described the British reaction to the war. In Africa he began to achieve his reputation as an interpreter of the ordinary soldier. Covered action in Italy, France, Germany, and became enormously popular. His style was simple, direct and sincere; his observations accurate; his point of view humble and sympathetic. His death occurred April 18. Best known works are *Ernie Pyle in England*, *Here Is Your War*.

Pyle, Geraldine Siebolds. Widow of Correspondent Ernie Pyle. She accompanied him before the war in all his travels as a roving reporter. Married 1925, they were divorced 1942, and remarried in 1943. Died, November 23, Albuquerque, New Mexico, aged 45.

Quisling, Vidkun. Former Premier of Norway. Gave the new term of opprobrium, quisling, to modern languages. Executed by a firing squad in Askershus Fortress, Oslo, October 24, at the age of 58. Sentenced to death by the Norwegian Supreme Court on 24 counts which included embezzlement, murder, and military and civilian treasons. A diplomat 1918-80. Political career began with appointment, 1931, as Minister of Defense in the Farmers' Party Government. Helped to execute the nation's disarmament program. His party lost control, 1936, and he was inactive until 1940, when he was made puppet premier by the Germans. Most important of the court findings was that he plotted with the Germans to accomplish the invasion of Norway. His defense was that if Germany had won the war, Norway would have benefited. He charged that Trygve Lie, Foreign Minister in the Labor Party, had schemed to cede northern Norway to Russia. 1933, established own party, the National Union, whose program included the suppression of Communism and labor unions.

Raizius, Dr. George W. Russian chemist. 1914, formed Dermatological Research and Laboratory Co. with Dr. Jay Frank Schamberg and Dr. John A. Kolmer. Synthesized arsenic bismuth compound used for syphilis. Headed research in dermatology in the Abbott Laboratories, Philadelphia. Responsible for the development of metaphen, a powerful antiseptic, and of diasones, possibly important in the cure of tuberculosis. His research with the sulfa drugs led to their general use in medicine. Died July 16, Atlantic City, N.J., aged 61.

Ramsay, Admiral Sir Bertram H. British naval hero. Allied Naval Commander in Chief since 1944. Helped Admiral Sir Andrew Brown Cunningham to plan the sea invasion of Africa, and planned the sea invasions of Sicily and France. Organized the fleet to rescue approximately 390,000 soldiers at Dunkirk and later cleared the port of Antwerp to speed aid to the troops in France. Killed in plane crash on trip to London, January 2, aged 62.

Rand, Dr. Edward K. (1871-1945). Educator. Professor Emeritus of Latin at Harvard College. Internationally known authority on the classics. Died Cambridge, Mass., Oct. 28.

Randall, Rear Admiral Albert. Former captain of the Leviathan and the Manliathan. Noted for numerous rescues at sea. Retired 1939 after 40 years of service, but appointed commandant of the U.S. Maritime Service when World War II began. Died December 1, Bethesda, Md., aged 66.

Randall-MacIver, David (1873-1945). Archeologist and author. Explorations in Egypt, South Africa, and Italy. Author of *Villanovans and Early Etruscans, Italy before the Romans*, and *Greek Cities in Italy and Sicily*. Died New York, Apr. 30.

Rapes, Erno. Director of music at the Music Hall, Radio City. Born in Hungary, 1891, where he began a career in music as pianist. Came to U.S. 1912. Conducted at the Fox Theater in Philadelphia and at the Rialto, Capitol, and Roxy Theaters in New York. Composer of songs: "Diane" and "Charmaine." Director of music for Warner Brothers and the National Broadcasting Co. Awarded the Mahler Medal of Honor for conducting of Mahler's Eighth Symphony. Died New York, June 26.

Reid, Frank R. Congressman from Illinois, 1923-34. Defended unsuccessfully the late Brigadier-General William Mitchell when the latter was court-martialed for criticism of naval and military aviation. Died Aurora, Illinois, January 25, aged 66.

Reinhardt, Paul. Art dealer and head of the Reinhardt Galleries, N.Y. His most successful one-man show was an exhibition of the work of the Spanish painter, Zuloaga, which was seen by approximately 70,000 persons. He was the first American dealer to give Marc Chagall, the Russian painter, a chance to exhibit his work in a gallery. Died New York, January 13, aged 56.

Ricci, Renate. Fascist editor and writer. Executed on or about April 28, near Milan. Served under Gabriele d'Annunzio when the latter seized Fiume, 1919. Head of *Il Babuino*, a Fascist youth organization, and Minister of Corporations, 1939-40. In charge of the Republican Fascist Militia, 1943, aged 49.

Roosevelt, Franklin Delano. 32d President of the U.S., he had begun his fourth term in office at the time of his death. Born in Hyde Park, N.Y., Jan. 30, 1882, he attended Groton, and Harvard University, receiving his A.B.

in 1904. Married in 1905 to his sixth cousin, Anna Eleanor Roosevelt, he completed his studies at Columbia Law School and passed the bar examination in 1907. Served as State Senator 1910-13, when he opposed the power of Tammany in New York politics, and as assistant secretary of the Navy, 1913-20. Stricken with poliomyelitis August, 1921, he made a slow recovery, finally discarding crutches and moving about thereafter with the aid of canes and braces. Returned to politics 1924, when he became a prominent figure in the Democratic Party. Elected Governor of New York 1928, serving in that position until 1932. Secured the creation of the St. Lawrence Power Authority.

Elected President 1933, when the nation was in the severest depression of its history, he initiated many legislative and administrative reforms. These included the bank holiday and emergency banking controls, legislation for the repeal of prohibition, and a farm-subsidy measure under which the Agricultural Adjustment Administration was set up. Other laws established the Civilian Conservation Corps, the Tennessee Valley Authority, the Securities and Exchange Commission, the Home Owners' Loan Corp., an expanded Reconstruction Finance Corp., the National Recovery Administration, the Federal Emergency Relief Administration, the National Youth Administration, and the Works Progress Administration. The climax of his period in office took place in his third term, with the entrance of the U.S. into World War II. Mobilizing the nation for war took the place of the problem of restoring it to prosperity. At the time of his death victory was almost at hand.

Mr. Roosevelt died April 12 in his home at Warm Springs, Georgia, of a cerebral hemorrhage. He was buried April 15 at his estate, Hyde Park, N.Y.

Rose, Maj. Gen. Maurice. Commander of the U.S. Third Armored Division. Fought in Africa, Sicily, and Italy. Helped to break a German counterattack in Normandy, closed the gap at Argentan-Falaise, and later led his men through the West Wall. Repeatedly distinguished for bravery and inspiring leadership. Killed in action near Paderborn, Germany, March 30, aged 48.

Rothenstein, Sir William. English writer and painter. Principal of the Royal College of Art, 1920-35 and attached to the Royal Air Force, as unofficial artist, since 1939. Painted celebrities and wrote memoirs *Men and Memories since Fifty*, containing anecdotes about well-known people, such as Pablo Picasso, Albert Einstein, and H. G. Wells, with whom he was acquainted. Died Stroud, Gloucestershire, England, February 14, aged 73.

de Rothschild, Baroness Nelly. Member of the famous banking family. Prominent in French society before leaving France to escape the Nazis. Active in charities, she was serving as a nurse in a New York hospital at the time of her death. Died New York, January 8, aged 58.

Rupertus, Maj. Gen. William H. Military leader. Commandant of Marine Corps Schools at Quantico, Va. Served in the Solomons and Palau islands during World War II. Received Navy Cross from Admiral Chester W. Nimitz and Distinguished Service Medal from General Douglas MacArthur. Died Washington, D.C., March 25, aged 56.

Russell, Dr. James E. Educator. Instrumental in the merger of Teachers College and Columbia University. Raised standards of teacher education and introduced scientific methods. Professor of education at Teachers College, 1897-1927, and dean emeritus at his death. Directed its growth from a private, normal school, with an enrolment of 169, to a college of 5,000 students and a staff of 250, with an endowment, 1927, of \$3,000,000. Author of *The Extension of University Training in England and America*, *German Higher Schools*, *The History, Organization, and Method of Secondary Education in Germany*, *Trends in American Education*. Died Trenton, N.J., November 4, aged 81.

Ryan, Msgr. John A. Roman Catholic educator. Appointed Domestic Prelate 1933 by Pope Pius XI. Professor of moral theology and sociology. Catholic University, Washington, 1915-39. Director of social action of National Catholic Welfare Conference. Advocate of child labor legislation, minimum wage laws, and collective bargaining. Supporter of the late President Roosevelt. Author of *A Living Wage*, *A Better Economic Order*, and *Distributive Justice*. Died St. Paul, Minn., September 16, aged 76.

Salten, Felix. Viennese essayist, playwright, and novelist. Fame in the U.S. based on stories of animal life, best known of which, *Bambi*, was made into an animated cartoon, 1942, by Walt Disney. Other works: *The City Jungle*, *Florian*, *A Forest World*. Early in career used as pen name "Martin Funder." Flew from Austria at time of invasion by Germans. Died Zurich, Switzerland, October 8, aged 76.

Sandrich, Mark. Motion-picture producer and director. Directed musical films featuring Ginger Rogers and Fred Astaire. Other films: *Man about Town*, *Skyark*, *Holiday Inn*. Died Hollywood, Calif., Mar. 4.

Sanford, Dr. Steadman V. Educator. Chancellor of the University System of Georgia. Founder and first president of the Southern Conference, an intercollegiate athletic body. Protested against Governor Eugene Talmadge's removal of ten teachers who supported what Talmadge

called racial co-education. Believed in limited assistance to college athletes. Died Atlanta, Georgia, September 15, aged 74.

Schelling, Dr. Felix E. Scholar. Authority on the Elizabethan period. Professor of English literature at the University of Pennsylvania, 1893-1929. His works include: *The English Chronicle Play*, *History of Elizabethan Drama*, *The English Lyric*. Died Mt. Vernon, N.Y., December, aged 87.

Schrems, Archbishop Joseph. Religious leader. Born in Bavaria. Head of the Roman Catholic diocese in Cleveland. Writer of hymns. Emphasized responsibilities of the priest in secular affairs. Outspoken opponent of Prohibition and supporter of the late President Roosevelt in many of his policies, until 1940. Died Cleveland, November 2, aged 79.

Scorza, Carlo. Fascist editor and publisher. Executed with Mussolini, April 28, near Milan by Partisans. Founder and editor of *Il Popolo Toscano*. Organized shortly after World War I a corps of desperadoes whom he placed at the service of Mussolini when the latter was about to march into Rome. Member of the Grand Council of the Fascist party and Director of the State Press Department. Appointed Secretary-General of the party, 1943, in which position he was required to eliminate discontent over failure to prosecute the war successfully, aged 64.

Seabrook, William. Author. Wrote *The Magic Island* and *Jungle Ways*, in which he told, respectively, of his adventures among the voodoo worshippers of Haiti and the natives of Africa. Best known for *Asylum*, 1935, in which he described a cure that he took for alcoholism. Died Rhinebeck, N.Y., September 20, aged 59.

Seredi, Justinian, Cardinal. Roman Catholic Primate of Hungary and Archbishop of Esztergom. Active opponent of Nazism in Hungary. Seized as hostage by the Nazis shortly before the Soviet armies took Budapest. Death reported to have taken place April 13, aged 61.

Sert, José Maria. Spanish painter. Supporter of Franco and attaché for a time in the Spanish embassy to the Vatican. His murals appear in the Council Room of the League of Nations, Geneva, in the lobby of the R.C.A. building, Radio City, N.Y., and in the Sert Room of the Waldorf-Astoria, N.Y. Succeeded Diego Rivera in the work of decorating the R.C.A. building when the latter included a portrait of Lenin in one of his panels. Died Barcelona, Spain, November 27, aged 69.

Shaposhnikov, Marshal Boris. Russian military leader. Colonel in the army of the last Czar. Became Chief of the Soviet Supreme Military Academy, Vice-Commissar of Defense, and military adviser to Joseph Stalin. Directed the conclusion of the Finnish campaign and, as Chief of the General Staff, the first year of the war with Germany. Death reported from Moscow, March 27, aged 63.

Scherbakov, Alexander S. Soviet leader. Member of the Communist Party's political bureau, Secretary of the Central Committee, and head of the Red Army's Department of Politics and Information. Credited with building high morale and for maintaining discipline of troops and officers. Died Moscow, May 7, aged 44.

Shear, Dr. Thomas Leslie. Archeologist on staff of Princeton University. From 1931-39, directed excavations in ancient Athens. His many researches extended knowledge of the ancient world. Belonged to many societies. Died July 3, Lake Sunapee, N.H., aged 65.

Sheehan, Winfield R. Motion-picture producer. Helped to establish the Fox Studios in 1914 and produced *What Price Glory*, *Cavalcade*, and *Captain Edads*. Discovered such stars as Janet Gaynor, Shirley Temple, and Spencer Tracy. Left Fox in 1935, when the firm was merged with 20th Century into the 20th Century-Fox Film Corp. Died Hollywood, Calif., July 25, aged 62.

Siloti, Alexander. Russian pianist. Student of Franz Liszt. On the staff of the Juillard School, 1924-42. Formerly conducted the Moscow Philharmonic Orchestra. Died New York, December 8, aged 82.

Simmons, William J. Leader in fraternal orders, preacher, and salesman. Started modern version of the Ku Klux Klan, 1915, with himself as first Imperial Wizard. Resigned 1923, claiming to have increased membership to five million. Other orders in which he was active were the Knights of the Kamelia and The White Band. Died Atlanta, Georgia, May 18, aged 75.

Slesinger, Tess. Author. Best known for *The Unpossessed*, a satire on people living in the Greenwich Village section of New York City. Wrote for Hollywood the scripts of *The Good Earth* and *A Tree Grows in Brooklyn*. Died Los Angeles, Calif., February, aged 40.

Smith, Lady Eleanor. British novelist. Daughter of the first Earl of Birkenhead. Author of gipsy and circus stories. Works: *Life's a Circus*, autobiography, *Red Wagon*, and *Flamenco*. Died October 20, London, England, aged 43.

Solari, Marcello. Italian Minister of the Treasury. Retired from politics for twenty years, during the Mussolini regime. Active supporter of the parliamentary system against Fascism. Returned to public life, 1944, becoming a member of the Cabinet under Ivanoe Bonomi. Died July 23, Turin, Italy, aged 63.

Southworth, Maj. William B. Baseball player and son of Billy Southworth, former manager of the St. Louis Cardi-

nals. Maj. Southworth was killed when the B-29 which he was piloting crashed in Blushing Bay, N.Y. He was 27 years old when his death occurred, February.

Sperry, Edward G. Industrialist. Vice-president, director, and treasurer of Sperry Products, Inc. an offshoot of the Sperry Gyroscope Co., founded by Mr. Sperry's father, the late Dr. Elmer A. Sperry. During World War II his company produced special parts for ordnance and rail-flaw detector cars, used in the examination of railroad tracks. Died Glen Cove, L.I., November 6, aged 54.

Starace, Achille. Fascist politician. Executed by Partisans near Milan, April 28. Secretary-General of the Fascist party, 1931-39. Chief of Staff of Fascist Militia, 1939. His function was largely to maintain loyalty and obedience to Mussolini and to impress the people with demonstrations of the power and authority of Fascism. Aged 56.

Stebbins, Dr. George C. Author of hymns and choir director. Composed for Dwight L. Moody, the evangelist. Best known hymn: "There is a Green Hill Far Away." Died Catskill, N.Y., October 6, aged 99.

Stephanie, Princess. Daughter of Leopold II, King of Belgium. Her husband, Crown Prince Rudolph, was the son of Emperor Franz Joseph and the principal figure in the perennially discussed Mayerling affair. 1900, married Count Lonyay, a Hungarian. Full name. Princess Stephanie Clotilde Louise Herminie Marie Charlotte. Died in Hungary, September, aged 81.

Sugiyama, Field Marshal Gen. Japanese statesman and military leader. Commander in Chief of the Japanese Army in North China, 1938-39. Chief of General Staff, 1940-44. War Minister in the cabinet of Premier Kuniaki Koiso, resigning with the government in 1945. Shot himself in Tokyo, September 12, aged 65.

Sybil, Lady Eden. Mother of Anthony Eden, former Foreign Secretary of Great Britain. Dame of Grace of the Order of St. John of Jerusalem. Active in charities. Died June 17, Windelsol, England.

Symons, Arthur. British critic, poet, and translator. A contemporary of Oscar Wilde and Aubrey Beardsley. His translations were influential in spreading the popularity of Verlaine, Baudelaire, Mallarmé, D'Annunzio, and others. Author of *Confessions* (1930), a narrative of his successful attempt to regain his mental health in Italy, 1908-1909. Published many volumes of verse. Prose. *Studies in Two Literatures. The Symbolist Movement in Literature. The Romantic Movement in English Poetry. Dramatic Personae, Confessions.* Died, January 22, Wittersham, England, aged 80.

Szold, Henrietta. Founder of Hadassah, a Zionist organization for women. Supervised for twenty-five years the settlement of Jews in Palestine. Extended medical facilities in Palestine and helped to raise funds. Died February 13, Palestine, aged 85.

Taft, Henry W. Lawyer. Brother of the late William Howard Taft, former President and Chief Justice of the U.S. Served on the Commission for the Reorganization of the New York State Government, on the advisory committee appointed to investigate the New York schools, and on the Committee on Costs of Education, to which he was appointed by Governor Lehman. Trustee of the Mutual Life Insurance Co. and former trustee of the City College of New York and of the New York Public Library. Died New York, August 11, aged 86.

Tardieu, André. Three times Premier of France, he was instrumental in the writing of the Versailles Treaty and was its last surviving French signer. Served as Minister of Liberated Regions, Minister of Interior, Minister of War, and Minister of Foreign Affairs in the Cabinets of Clemenceau, Briand, and Laval. Died September 21, Menton, France, aged 69.

Tatekawa, Lt. Gen. Yoshitsugu. Japanese statesman. Ambassador to Moscow, 1940. Many other posts in diplomacy and government. Military attaché to the Japanese Legation in China and military attaché in London; secretary to the Ministry of War and a member of the Japanese delegation to the Disarmament Conference at Geneva. Died Japan, September 10, aged 65.

Thomas, Sen. John. Anti-New Deal isolationist; leading Republican. Appointed to Senate, 1928, elected same year. Later, 1940, appointed to succeed the late Senator Borah. Re-elected, 1940. Director of several banks and corporations. Member of committees on Banking and Currency, Irrigation and Reclamation, Military Affairs, and Public Lands. Died November 10, Washington, D.C., aged 71.

Thompson, Oscar. Writer and educator. Music critic of *The Sun*. Taught music at Curtis Institute, Philadelphia. Editor in chief of *The International Encyclopedia of Music and Musicians*. Author of *Practical Music Criticism, The American Singer, Debussy: Man and Artist.* Died New York, July 8, aged 57.

Todd, John R. Builder and manager of Rockefeller Center. A lawyer and horticulturist. Died New York City, week of May 21, aged 78.

Tokle, Torger D. Champion ski-jumper. Coming from Norway to the U.S. in 1939, he enlisted in the Army, 1942, and became a citizen in 1943. Killed at the age of 26, March 3, Italy, while leading a platoon across the

Apennines. Made record jump of 289 ft., March 1, 1942, in Pine Mts. of Utah.

Tolstoy, Alexei. Russian author, distantly related to Count Leo Tolstoy and Turgenev. Regarded by many Russians as the best of contemporary Soviet writers. Fled from Russia after the revolution, but permitted to return. Best known works are *The Road to Sufrage* and *Peter the Great*, novels. Also wrote play, *Rasputin*, produced in Berlin, 1917. Died January 23, Moscow, aged 82.

Tolstoy, Count Leo. Sculptor and writer. Third son of the author of *War and Peace*. Exiled from Russia in 1918 as a result of his editorials in *Veritochka* opposing the government, he visited and lectured frequently in the U.S. Died October 18, Halsingborg, Sweden, aged 76. Best known works: *For the Children, Years of Famine, Prelude of Chopin.*

Train, Arthur Cheney. Novelist and lawyer. Famous for his leading character, the shrewd legal operator "Mr. Tutt." Mr. Train performed the unique feat of writing a formal biography of this character created by himself. Works. *Tutt and Mr. Tutt, By Advice of Counsel, The Adventures of Ephraim Tutt, Yankee Lawyer, the Autobiography of Ephraim Tutt.* Died December 22, New York, aged 70.

Traute, Harry. Manager for fifty years of book-match department of Diamond Match Co. Popularized the now universal book matches by placing striking surface outside and reducing size. Once filled single order of 1,000,000,000 books of matches. Died September 7, Seabright, N.J.

Tully, Richard W. (1877-1945). Playwright. Greatest success with *The Bird of Paradise*, which involved him in a plagiarism suit, ultimately resolved in his favor, that lasted for 18 years. Died New York, Jan. 31.

Valéry, Paul. French critic, poet, and philosopher whose writings are difficult and few in number, but widely respected by cognoscenti. Admitted to the French Academy in 1925. Works. *La Jeune Parque, Le Cimetière Marin, Aurore, (verse), Regarde sur le Monde Actuel, Soirées avec M. Teste, (prose).* Died August 20, Paris, France, aged 74.

Van Anda, Carl V. Journalist. Employed as managing editor of the *NY Times*, 1904-25. Under his direction the paper acquired a reputation for presenting the news promptly, accurately, and completely. Noted in particular for his coverage of the Japanese naval victory over the Russians in the Shimonoseki Straits, the sinking of the Titanic in 1912, the discovery of the tomb of Tut-Ankh-Amen, the Byrd and Amundsen expeditions. Died January 28, New York, aged 81.

Van de Water, Virginia Terhune. Author. Sister of Albert Payson Terhune, the writer of dog stories. Wrote numerous magazine stories. Her works include two novels. *The Shears of Delilah and The Heart of a Child.* Died October, Pompton Lakes, N.J., aged 80.

von Mackensen, Field Marshal August. General in the German Army, World War I. Led the Eleventh Army against the Russians and conquered much of Serbia and Rumania. Later placed in command of the Armies of the Central Powers in the Balkans. He had served in turn under Bismarck, Kaiser Wilhelm II, and Adolf Hitler. Petitioned Hitler, 1938, to release Rev. Martin Niemöller from concentration camp. Died near Celle, Germany, November 8, aged 96.

Wainwright, Col. Jonathan M. Cousin of General Jonathan Wainwright. Assistant Secretary of War under Harding. Republican Congressman from N.Y., 1923-31. Withdrew from office because, as an advocate of Prohibition, he disagreed with most of his constituents. 1940, anticipated U.S. participation in World War II and urged universal, compulsory military training for both men and women. Died June 3, Rye, N.Y., aged 81.

Watson, Maj. Gen. Edwin M. Secretary and aide to President Franklin Delano Roosevelt. Served as aide to President Wilson at Paris Peace Conference and as military attaché at American Embassy in Brussels, 1927-31. Accompanied his chief to Yalta Conference, and was stricken aboard warship while on his way home, February 20, Aged 62.

Weber, Orlando F. President of the Allied Chemical and Dye Corp., 1920-34. Helped to found the organization after World War I, as a holding and operating company. Instrumental in the development of the corporation into a \$500,000,000 business. Died New York City, September 6, aged 66.

Werfel, Franz. Austrian author and playwright whose famous work, *The Forty Days of Musa Dagh*, was suppressed by the Nazis. Forced to leave Austria, he settled in Lourdes, France, where he was inspired by the local legend to write *The Song of Bernadette*. The Hollywood film version of this novel won five Academy awards. Died August 23, Hollywood, Calif., aged 55. Other works: *Embezzled Heaven, Jacobowsky and the Colonel.*

Weyerhaeuser, Frederick E. Wealthy lumber dealer. Family much publicized in press, 1935, when his grand-nephew, George Weyerhaeuser, was kidnapped and ransomed for \$200,000. Mr. Weyerhaeuser died St. Paul, Minn., October, aged 73.

Woolsey, John M. Federal judge. Famous for his handling of the obscure law on obscenity. Responsible for

the verdict which admitted James Joyce's *Ulysses* into the U.S. He held that the disputed passages of Joyce's work served legitimate esthetic ends and could not be regarded as pornographic. Also passed *Contraception*, by Dr. Marie Stopes. Nominated by President Herbert Hoover as judge in U.S. District Court, Southern N.Y. District. Retired December 31, 1943. Died May 4, New York, aged 68.

Wick, Dorothea. German film star. Performance in *Mädchen in Uniform* gained her fame in U.S. Made two films in Hollywood, but returned dissatisfied to Germany, 1939. Early appearances with Max Reinhardt's Company. Reported a favorite of Hitler. Killed, Dresden, during an air raid, about March 10, aged 37.

Wing, Maj. Gen. Leonard F. Leader of 48rd Division in its campaigns from New Guinea to Manila. Noted as a tactician and a leader who inspired his troops to accomplish impossibilities. Received Distinguished Service Medal. Member of law firm of Fenton, Wing, and Morse. Died December 19, Rutland, Vt., aged 52.

Wirkus, Faustin E. Son of a Polish miner in the Pennsylvania coal regions. Became warrant officer in the Marine Corps. As such, and as officer in the Haitian Constabulary, he governed 12,000 natives of La Gonave in Port-au-Prince Bay. Because of his name (that of an admired Haitian king), the natives created him King Faustin II, the "White King of La Gonave." Died October 8, New York.

Witov, Wincenty. Vice President of the Polish National Council. Assisted in the formation of the present Polish Government. Former head of the Polish Peasant Party, and three times Premier of Poland. With Marshal Josef Pilsudski and Ignace Paderewski, helped to create Polish Republic after World War I. Exiled 1931, by the Pilsudski Government, he returned to Poland 1939, and was imprisoned by the Germans. Died October 31, Cracow, aged 71.

Wolfe, Julia E. Mother of the late Thomas Wolfe, the novelist. Source of encouragement of her son. Managed his estate. Had come from her home in Asheville, N.C., to New York to place some of his work with producers. Died December 7, New York, aged 85.

Wyeth, N. C. Illustrator and painter. Pupil of Howard Pyle. Best known for conception of such figures as Long John Silver, Deerslayer, Odysseus, and Captain Horatio Hornblower. Died October 19, Chadds Ford, Pa., aged 63.

Yeakum, Dr. Clarence S. (1879-1945) Educator. Dean of the graduate school of University of Michigan. Leader in field of applied psychology. Author of *Army Mental Tests and Selection and Training of a Salesman*. Died Ann Arbor, Mich., Nov. 22.

Young, Dr. Hugh H. Surgeon and urologist. 1902, developed new method of excising the prostate gland. Established Brady Clinic, 1903, with funds given by one of his former patients, Diamond Jim Brady. Took part in research which resulted in production of mercurochrome, 1924. Founder and editor of *Journal of Urology*. Died August 23, Baltimore, Md., aged 75.

Zuloaga, Ignacio. Spanish painter of gypsies, bull-fights, and landscapes. Influenced for a time by Gauguin and Lautrec, but in the tradition of Velasquez and Goya. Great richness of color, and dramatic bravura; he was a finished painter. Widely admired are: "*Daniel Zuloaga and His Daughters*," "*Dona Mercedes*," "*Promenade after the Bull-Fight*," "*Gypsy Ball*." Died October 31, Madrid, Spain, aged 75.

NEGROES. In 1945 the Negro in America made considerable progress toward interracial understanding.

Education. Thirty-two of the smaller colleges and schools, supported by gifts and grants solicited from year to year, pooled their efforts in a drive for funds. The General Education Fund appropriated \$1,551,000 to be divided among these schools. The equalization of the salaries of Negro school-teachers was accomplished in more localities in the South.

Pres. James A. Colston, of Bethune-Cookman College, Florida, announced the accreditation of the college by the Florida State Department of Education.

Religion. Dr. Benjamin Mays, president of Morehouse College, Georgia, was elected First Vice President of the American Federation of Churches.

Integration. G. D. Rogers, President of the Central Life Insurance Company, was elected to the Tampa, Florida Chamber of Commerce.

The late Booker T. Washington, scientist, educator, founder of Tuskegee Institute, and author of the classic *Up From Slavery* and the *Atlanta*

Address, was elected to the Hall of Fame by New York University. Negroes and whites of Indianapolis, Indiana, worked hand in hand for the betterment of the community and for race understanding. White children from a New Hampshire community, who had been hosts to Negro children in 1944, were guests of the Negro children in Harlem in 1945.

Zoning. Four Negro citizens of Miami were arrested on the complaint of white property owners for buying property in a white neighborhood. The judge discharged the defendants on the grounds that they were not bound to observe any property-restricting agreements entered into by white owners since there is nothing in the Constitution of the U.S. which permits restrictions on the basis of race. White property owners of Los Angeles, Calif. attempted to eject Louise Beavers, Negro actress, and Noble Sissle, Negro musician, from their properties on the grounds that they were in a white community. This complaint was also ruled against.

Disorders. Northwest Florida produced the only verified case of lynching in the nation for the year. Racial tension, however, appeared in widely-scattered communities. Outbreaks in public schools between white and colored children were reported from Chicago, Gary, New York, Boston, Cleveland, and Youngstown.

Politics. The FEPC failed to become law in the land. Funds for its continuance were voted for one year only, after a furious assault upon FEPC on the floor of the Senate by both Mississippi Senators. It was pigeon-holed for future consideration. The Georgia Supreme Court ruled for the admission of Negroes to the hitherto white Democratic primaries. The Supreme Court of the State of Florida handed down a decision that the Negroes are free to participate in its Democratic primaries.

Walter White, Mary McLeod Bethune, and Dr. William E.B. DuBois were accredited to the San Francisco Conference as Consultants on Race Affairs and as observers. Attorney Irvin C. Mollison was appointed Judge of the U.S. Continual Customs Port at Chicago, Ill.

Sports. Major league baseball signed its first Negro in the person of Jackie Robinson, short-stop, formerly of the Kansas City Monarchs. The owners of the Brooklyn Dodgers bought Jackie Robinson, and he is being farmed out to Montreal for the coming season. Joe Louis, heavyweight boxing champion, signed for a fight with Billy Conn to take place in the spring of 1946.

Theater. Paul Robeson closed his run of nearly three years in *Othello*. *Anna Lucasta*, with an all-Negro cast including Frederick O'Neal, continued on Broadway. *Deep are the Roots*, a dramatization of the problem of the Negro war veterans, opened late in 1945. *Strange Fruit*, a dramatization of Lillian Smith's controversial novel, opened late in 1945. *Memphis Bound*, a swing version of *H.M.S. Pinafore*, with Bill Robinson appeared briefly on Broadway.

Books. The outstanding books by Negro authors in 1945 were *If He Hollers Let Him Go*, Chester B. Hines; *Black Boy*, Richard Wright; *They Seek A City*, Arna Bontemps; *African Journey*, Eslanda Robeson; *Swing Low*, Edwin A. Peeples, Jr.; *Wind is Rising*, Walter White.

Pictures. Lena Horne continued to charm her way along in Hollywood. Hattie McDaniels and others kept before the public eye.

Negro Press and Publications. *Ebony*, a picture magazine similar to *Life*, appeared on the stands late in 1945.

The press publicized charges of discrimination

in the armed forces of the U.S. One of these charges was that Negro soldiers were not being discharged fairly.

The Armed Forces. Many Negro officers from Italy and the Near East gave up their rank during the invasion of the continent in order to join white contingents in the terrible warfare in Belgium and Germany. It was necessary for them to do this if they wished to fight in the already completely staffed regiments of the white divisions, otherwise those units would have been staffed far beyond army regulations. All who survived had their rank restored.

Comments. In race relations, 1945 was a paradoxical year. On the one hand was a more widespread race irritation, and on the other, a greater diffusion of integration and the will to understand. The year was a poor one for the prophets. The terrible and bitter race war that was predicted on the immediate end of hostilities abroad did not come to pass. But neither did the universal lifting of all inequalities, predicted during the war years by some. What has happened has been mostly to the good.

One encouraging sign was the increasingly critical attitude of the commentators and editors of their own groups on both sides of the line. Negroes have questioned and blamed members of their own race for certain things, and whites have accused each other of fomenting trouble. Both sides are beginning to be less sentimental and more realistic. Perhaps the unprecedented contacts in the armed forces as well as in civilian life by the war efforts have borne fruit. They are being recognized and considered by their brothers in white. A greater diffusion and a broader integration into the life of the nation are certainly more evident. From all indications during 1945, it would seem that the broader dissemination of education and preparation among Negroes is making the old order untenable and bringing Negroes and whites nearer to understanding.

ZORA NEALE HURSTON.

NEPAL. A small independent kingdom between Tibet and India, on the southern slope of the Himalayas. The territory includes Mount Everest (29,002 feet). Area, 54,000 square miles. Capital, Katmandu. The government is a military aristocracy based on birth. The king is Tribhubana Bir Bikram, who succeeded his father on Dec. 11, 1911. All power is in the hands of the Prime Minister, a member of the ruling family. This was Gen. Sir Padma Shumshere Jung Bahadur Rana, who succeeded his uncle, Nov. 29, 1945.

The population is estimated at 5,600,000, of whom the majority are Gurkhas, descended from invaders who overran the country in the latter half of the eighteenth century. Gurkha troops fought with the Allies in World War II. Hinduism is gradually replacing Buddhism as the dominant religion. The economy of Nepal depends heavily upon agriculture and animal production. In spite of its mountainous character it is well provided with fertile valleys as well as valuable forests. The principal exports are rice, jute, hides, cattle, lumber, oilseeds, and ghee. It is necessary to import textile and metal products, as well as sugar and salt.

NETHERLANDS. A constitutional monarchy of northwestern Europe. Capital, Amsterdam; seat of the Government, The Hague. Sovereign, Queen Wilhelmina, who succeeded to the throne Nov. 23, 1890, and was crowned Sept. 6, 1898. The country

was invaded by German military forces on May 10, 1940, and remained for the most part under German occupation until May 4, 1945 (see *Events*, below).

Area and Population. The area, including water belonging to municipal territories, is 13,515 square miles. The population on Jan. 1, 1944, was estimated at 9,090,000 (7,935,565 at the 1930 census). About 94 per cent of the people dwell in communities of 2,000 or more. Vital statistics (1943): 22.9 live births per 1,000 inhabitants (21 in 1942), 9.7 deaths per 1,000 (9.5 in 1942). The infant mortality rate (deaths under one year per 1,000 live births) was 38. There were 87,689 marriages in 1942. Estimated populations of the chief cities on Jan. 1, 1939, were: Amsterdam, 793,222; Rotterdam, 612,375; The Hague ('s Gravenhage), 494,773; Utrecht, 163,589; Haarlem, 137,507; Groningen, 120,010; Eindhoven, 111,188; Tilburg, 95,142; Nijmegen, 94,102; Enschede, 90,291; Arnhem, 88,996; Leiden, 77,009. The central section of Rotterdam was completely destroyed by German air attacks on May 14, 1940.

Government. The Constitution of 1814, with its various amendments, vests executive power exclusively in the sovereign while legislative authority rests co-jointly in the sovereign and the States-General (parliament). The States-General consisted of an upper chamber of 50 members, chosen by elected representative bodies in the several provinces for terms of six years; and of a lower chamber of 100 members elected for four years by general adult suffrage. In practice the Cabinet was responsible to the States-General and the Premier was normally chosen by the sovereign from a political group commanding a parliamentary majority. The Premier proposed the members of his ministry to the sovereign. After the liberation of the Netherlands, constitutional conditions, which had been suspended by the invader, were gradually restored, but no new parliament had been elected up to the end of the year.

For the governmental set-up under German rule and the composition of the Netherlands Government in Exile, functioning in London during the war, see *YEAR BOOK* for 1944, pp. 436-437.

Production. Agriculture, manufacturing, commerce, and mining are the principal industries. Yields of the chief crops in 1939 (in metric tons) were: wheat, 416,500; barley, 146,000; rye, 603,500; oats, 449,200; potatoes, 3,000,000; beet sugar (1939-40), 217,600; linseed, 22,500; flax, 21,300. Livestock (1942): 2,440,553 cattle, 491,000 swine, 337,177 horses, and 574,497 sheep. The yield of the sea fisheries in 1939 was 169,900 metric tons, valued at 15,700,000 guilders. The estimated 1940 mineral production was (in metric tons): coal, 13,000,000; pig iron, 300,000; copper, 1,000; zinc (smelter) in 1939, 20,500. The 1939 output of rayon and staple fiber was about 11,000 metric tons; wood and straw pulp, 108,000; butter, 108,400; cheese, 120,600; margarine, 71,000; shipping tonnage launched, 117,000. Bricks, clothing, boots and shoes, engines, boilers, machinery, cotton and linen fabrics, alcoholic beverages, tobacco products, are other leading manufactures.

An official survey of cattle herds made in July 1945 showed an over-all loss in cattle stock of 15.4 percent, but of 21.9 percent in milch cows, as compared with 1940. Cattle numbered 2,277,105, whereof 1,188,212 were cows. Of the prewar stock of 1,553,413 pigs, only 768,733 were left. The country's poultry flock was seriously reduced, from 30,000,000 to about 4,000,000. Coal production, in Limburg province, showed a marked upward

trend in the latter half of 1945; a daily output of 26,000 tons was reached in November.

Foreign Trade. No trade statistics have been published since the beginning of the German occupation. For the volume and distribution of Holland's foreign commerce before the war, see *YEAR BOOK* for 1940.

Events, 1945. The course of events in the Netherlands, in 1945, by and large followed the pattern set in neighboring Belgium. There were the same problems of transition from Nazi vassalage to full independence, the same economic difficulties, the same friction between resistance movement and exiled government, and the same grumbling over the pace of the purge. Unlike Belgium, however, Holland did not go through a dynastic crisis, the return of Queen Wilhelmina and the royal family being accepted as a matter of course by all but a small fraction of the Dutch people.

The Darkness Before Dawn. For the stalwart Dutch, the year opened on a note of stark tragedy. The few months that separated them from victory were among the grimmest in the nation's history. The country was split into two halves, on opposite sides of the firing line. Held on the Maas and Rhine rivers, as a result of the lost Battle of Arnhem (see 1945 Year Book), the Allied armies turned east for the decisive blow at Germany, leaving Holland's richest provinces and most populous cities in the hands of the enemy right up to the hour of final victory.

Piecemeal liberation brought fresh misery and hardships to the Dutch people on either side of the dividing line along the Rhine and Maas. The smaller, southern portion of the country was severely ravaged by the tides of battle. To the north, the food scarcity reached famine proportions, while the Gestapo intensified its terror, and vast sections of fertile land were wantonly inundated by the enemy.

The Germans, already embittered by defeats on all fronts, raged at the aid given to the Allies by the Dutch underground. Prime object of their fury was the prolonged railway strike which crippled all transportation in Northern and Central Holland. Called by the exiled government in September, 1944, in support of the incipient liberation, the strike of the 30,000 railway workers continued without letup, in spite of German threats and reprisals; at least 160 of the strikers were executed.

Unfortunately, the railway strike, while hampering German operations, had also the effect of cutting off Holland's largest cities from desperately needed supplies. In Amsterdam, Rotterdam, The Hague, and other populous centers, food rations dropped far below subsistence levels. From about 630 calories per person at the start of the year, the daily food ration went down to 317 in early February. Thousands died of starvation, while others fell prey to the spread of diseases resulting from famine conditions. After liberation, some 30,000 people in Amsterdam alone were found to be suffering from hunger oedema.

During the first months of the year the Nazis did nothing to relieve the widespread starvation in the so-called "hunger provinces," North-Holland, South-Holland and Utrecht. Only at the immediate approach of defeat did they relent. At the end of April an agreement was reached between the Allied and German commanders on the delivery of emergency food to the civilian population. On April 29 and 30, British and American planes dropped hundreds of "food bombs" containing meat, vegetables, flour, yeast, milk, sugar, and other edibles over the famine-stricken cities. In

two days, 1,850 tons of supplies were dropped. In the following days the quasi truce was enlarged to permit Allied food trucks to cross the German lines with more provisions for the civilian population.

To the emaciated Hollanders, these food bombs truly were "manna from heaven." A few days before the first relief came, the last food ration had been distributed in several large cities. On May 5 all food ration coupons were to become invalid, without replacements.

Meanwhile the Nazi terror continued unabated. On March 8, Dutch patriots shot and wounded the notorious Police General Walter Rauter as his armored car sped through the village of Westhoeve in Gelderland province. In savage reprisal the Germans executed 500 persons, including 70 inhabitants of the little village where the attempt had taken place.

Adding to the heavy blood toll exacted from Holland in the last months of the war, British planes, attacking German V-2 launching platforms at The Hague, on March 3 mistakenly dropped their bombs on one of the most thickly populated sections of the city. The raid caused a veritable catastrophe, with 800 persons killed and over a thousand injured, while 28,000 were made homeless. The British Government offered apologies for the tragedy to the Netherlands Government.

Progress of Liberation. In the initial drive to the Maas and the Rhine estuary, in the fall of 1944, only the provinces of Limburg, Brabant, Zeeland, and parts of Gelderland had been liberated. Although this area for months remained in the operational zone, long-prepared measures for relief and rehabilitation were put in effect immediately.

The worst of the food shortage in the liberated provinces had been overcome by the end of 1944 and progress continued steadily in the new year. By mid-January, the daily food ration in the South had reached 1,600 calories per person and in February it was around 2,000.

Railway facilities, postal service and other essential communications were functioning in most liberated areas early in the year. River and canal traffic, always an important factor in Holland's transportation system, was slower to resume operations, due to the exceptionally severe winter, but in April the inland waterways of South Holland again were alive with hundreds of recovered barges and some larger vessels.

Militarily, the progress of liberation was slow in the first months of the year. An important addition to the freed territory was made on March 2 when the American Ninth Army captured Venlo and Roermond. In mid-April, large areas of northeastern Holland were overrun by Canadian airborne and armed forces. By the end of the month, the German forces had been herded into a large final pocket in Western Holland, centering on the country's chief cities. There, the Nazis hoped to make a last stand, while prolonging resistance in the mountain redoubts of Bavaria and Norway. On April 18, the enemy blew up the great water locks at Muiden, six miles east of Amsterdam, flooding a twenty-mile stretch of lowlands between Amsterdam and Utrecht. Large sheets of water also were created south and west of Utrecht in a desperate attempt to block the Canadians' advance toward the heart of the water-girt "Fortress Holland."

Victory Is Here. The German plans for last-ditch resistance in divers natural "fortresses" were foiled everywhere as the heart of the Reich was crushed by concerted blows from east and west. On May 4

Gen. Dwight D. Eisenhower announced the unconditional surrender of all German forces in Holland. The surrender took place at Wageningen, on the Lower Rhine, where Lt. Gen. Charles Foulkes, commander of the Canadian First Army Corps, dictated terms to Field Marshal Johannes Blaskowitz. It became effective on May 5, at 2 A.M. On May 6 the infamous Nazi commissioner for the Netherlands, Arthur Seyss-Inquart, was captured by the Canadians as he attempted to escape to Germany in a small boat. Anton Mussert, leader of the Dutch Nazis, was also seized.

Despite an urgent warning against "incidents," which the Netherlands Government radioed from London, sporadic clashes occurred. The most serious of these took place in front of the Royal Palace at Amsterdam, on May 7, when drunken German marines opened fire with hidden machine guns upon the celebrating crowds, killing 23 and wounding many more. Utrecht, Rotterdam and The Hague gave the Allied soldiers a riotous welcome. On May 8 General Foulkes announced that the forces under his command had taken complete control of western Holland. By May 14 all German troops in the country had been rounded up for removal to Germany.

Reshuffle and Return of the Government. Like other exiled regimes, the Cabinet of Premier Petr S. Gerbrandy came in for a good deal of criticism from the homefront which grew more outspoken as the moment of total liberation drew near.

As elsewhere, the resistance leaders were somewhat more radically-minded, and especially more severe toward collaborationists, than were the men of the exiled regime. Premier Gerbrandy had repeatedly promised that he and his Cabinet would resign upon liberation of the country, and the resistance leaders continually reminded the Government of this promise. Tension grew when the liberation of a substantial part of Southern Holland failed to bring about the promised resignation, or even a return of the Cabinet from its interim headquarters in London.

The crisis came into the open when the Minister of the Interior, J. A. W. Burger, in a broadcast on Jan. 14, held out the possibility of leniency for collaborationists. Burger's address, made without the Premier's foreknowledge, aroused a storm of protest both inside and outside the Cabinet, leading to his resignation on Jan. 26. This move did not, however, halt the further disintegration of the Government from which the Social-Democratic ministers presently also withdrew. On Feb. 8 the entire Cabinet resigned, but Queen Wilhelmina requested Premier Gerbrandy to form a new one. Composition of the reconstructed Government was announced in London on Feb. 23, the changes being almost wholly of a personal nature, except that the Social-Democrats stayed out of the new combination. On Apr. 6, however, the Cabinet was enlarged to include two prominent leaders of the resistance movement, Dr. Jan Eduard de Quay, who was named Minister of War, and Theodor Philip Tromp, Minister of Public Works.

The new Government was to be of short duration, for within a month the German surrender confronted Gerbrandy with the inescapable necessity of making good his resignation pledge. He did so on May 16, following the Government's return to The Hague. Two days later, Queen Wilhelmina—who, with Princess Juliana, had arrived in Southern Holland on May 3—began consultations with the men of the former underground with a view to forming a Government representative of the resistance movement.

A New Team Takes Over. On May 29 Queen Wilhelmina asked two of the foremost resistance leaders jointly to undertake the formation of a Government of National Reconstruction. They were Professor Willem Schermerhorn, 50-year-old geologist and chairman of the newly founded *Nederlandsche Volks Beweging* (Dutch People's Movement), a merger of democratic and liberal resistance groups; and Willem Drees, 58, an old-time Social-Democratic leader. Both men had remained in Holland throughout the war and occupation and had been in the forefront of underground resistance.

After lengthy consultations, designed to give the Reconstruction Government the broadest possible basis, a new Cabinet was formed on June 23, with Professor Schermerhorn as Premier and Mr. Drees as Minister of Social Affairs. A majority of the other ministers also were drawn from the ranks of the resistance movement. The only holdover from the original Gerbrandy Cabinet included in the new Government was Dr. Eelco Nicolaas van Kleffens who retained his post as Minister of Foreign Affairs which he had held since Aug. 10, 1939, regardless of ministerial shifts. By the retention of van Kleffens, who had headed the Netherlands delegation at the San Francisco Conference—where he strongly upheld the smaller nations' viewpoint—the continuity of Dutch foreign policy was emphasized as much as the Schermerhorn-Drees team gave evidence of a swing to the left from the Gerbrandy line.

After the installation of the new Government, Queen Wilhelmina on July 6 returned in triumph to the Royal Palace at The Hague from which she had been forced to flee on May 13, 1940. A huge crowd cheered the sovereign as she drove to the flower-bedecked palace through streets lavishly decorated with the red, white, and blue national colors and the orange emblems of the Royal House.

Reconstruction Tasks. The job Professor Schermerhorn and his colleagues had on their hands was not an easy one. Holland's once prosperous economy had been brought to fearful ruin. Roughly one-half of the country's livestock had been killed or exported by the Germans. Hundreds of thousands of acres of fertile land lay flooded with salt water, lost to cultivation for years to come. Other vast areas, inundated with fresh water, could be reclaimed sooner but would yield no crops before 1946. The transport system had been thoroughly wrecked and what the bombs and mines had not destroyed was in a sad state of dilapidation. There was an acute shortage of coal and other raw materials.

A comprehensive survey of Holland's material loss resulting from the war, made public in July, reached the staggering total of 15,000,000,000 guilders. Loss of real wealth through destruction, depreciation, disappearance of capital goods, and war claims was figured at 8,000,000,000 guilders; the remainder was accounted for by German exploitation of Dutch production and labor, and the disruption of foreign trade.

The Government's principal preoccupation was to get as much as possible done before another winter set in. Dikes had to be repaired, polders drained, houses patched up. Store shelves were practically bare except for fancy goods. There was a thriving black market in consumer goods, especially clothing.

The food situation improved steadily in the months following total liberation, what with the supplies brought in on Allied ships and the relief given by neutral countries, Sweden in particular. Holland's famed tulip industry reported a quick

return to normal conditions, with exports at the prewar rate of 10,000 tons of bulbs again in full swing by September.

The Purge. According to a statement made on July 13 by a spokesman of the Netherlands Civil Affairs Administration, there were at the time no less than 200,000 persons suspected of some sort of collaboration with the Germans. A majority of these were left in provisional liberty, to be dealt with at a later stage of the purge. There were simply not enough guards to stand watch over all of them, the spokesman declared.

Among the principal quislings and Nazi war criminals arrested after Germany's surrender, in addition to Seyss-Inquart and Mussert (see above), were: Meinoud M. Rost van Tonningen, former head of the Netherlands Bank, and the No. 2 leader of the Dutch Nazis; shortly after his arrest, he committed suicide by jumping from the fourth floor of his prison at The Hague; Max Blokzijl, radio propagandist who was sentenced to death on Sept. 25; A. G. Voûte, quisling burgomaster of Amsterdam; Professor Jan van Dam, Nazi-appointed Commissioner for Education; and the German Gestapo Chief Walter Rauter. Former Premier Dirk J. de Geer, who had led the flight of the Dutch Cabinet to Britain, in May, 1940, but the following year had returned to Holland, also was indicted on charges of collaboration.

On Aug. 4, the government appointed a five-man commission to purge both houses of the prewar Parliament of "those members who have behaved in an unpatriotic manner." After its "cleansing," the Lower Chamber met on Sept. 25 at The Hague in its first session since the Nazi invasion of May, 1940. Among other matters, the House discussed arrangements for an interim Parliament to serve until regular elections could be held. While local and provincial elections in Holland were expected to take place early in 1946, the government was unwilling to hold a national ballot before the second half of that year, in order to give the country more time to get organized.

Anton Mussert was finally brought to trial on Nov. 27, after various postponements. He pleaded not guilty to charges that he deliberately had attempted to bring the Netherlands under German domination, had tried to overthrow the Constitution, and had rendered aid to the enemy. He was sentenced to death on Dec. 12.

Demand for Annexation. A manifesto urging the Dutch people to support "with all forces" demands for annexation of German territory adjacent to the northeastern frontier of Holland, as partial compensation for the damages inflicted on the country by the Nazis' systematic devastations, was made public on Nov. 9 at The Hague.

The manifesto, bearing the signatures of forty prominent Dutch personalities, stated in part: "Germany caused us tremendous spiritual and material damage and if this is not compensated for, it will be impossible to reconstruct a new and prosperous Netherlands. Germany can only do this in the form of soil. Owing to Germany's fault, the problem of overpopulation has become even more acute, since many sources of income have been destroyed. No annexation means that many Netherlands will have to emigrate, with all the bitter consequences of such a step."

The Netherlands Government had previously reserved its right to claim German territories in compensation for the land wantonly inundated by the Nazis, but up to the end of the year no official demand for a border adjustment had been raised. Indications were that the Government would adopt

an expectant attitude until it felt quite sure that a majority of the Dutch population would support the annexation of German territory.

JOACHIM JOESTEN.

NETHERLANDS EAST INDIES. A group of large and small islands in the East Indies forming the main overseas territories of the Netherlands Kingdom, conquered and occupied by Japanese armed forces from 1942 until the surrender of Japan in September, 1945. Capital, Batavia, on the island of Java.

Area and Population. The area, population at the 1930 census, and population density of the island groups are shown in the accompanying table.

Group of islands	Sq. mi.	Population	Density*
Java and Madoera	51,032	41,718,364	817
Sumatra	164,148	7,677,826	47
Riouw-Lingga	12,235	298,225	24
Bangka	4,611	205,363	45
Bulliton	1,866	73,429	39
Borneo:			
West district	56,664	802,447	14
South and East districts	151,621	1,366,214	9
Island of Celebes			
Celebes	38,786	3,093,251	80
Manado	34,200	1,138,655	33
Molucca Is. & New Guinea	191,682	893,400	5
Timor Archipelago	24,449	1,657,376	68
Bali and Lombok	3,973	1,802,683	454
Netherlands East Indies	735,268	60,727,233	83

* Density per square mile.

The estimated population in 1940 was 70,476,000, including 68,832,000 natives. Java and Madoera had 48,416,000 inhabitants; the Outer Provinces, 22,060,000. There were about 250,000 persons classed as Europeans (many had some native blood), including 220,000 Dutch. Chinese numbered about 1,200,000; other alien Asiatics (mostly Hindus and Arabs), 115,000. Over 92 per cent of the population is rural. Chief cities (with latest available populations): Batavia 606,800, Soerabaja (Surabaya) 390,700, Semarang 217,796, Bandoeng 166,815, Soerakarta 165,484, Djokjakarta (Jogjakarta) 136,649, Palembang 109,069.

Education and Religion. According to the 1930 census, there were 4,296,579 literate persons, of whom 400,877 were able to write Dutch. In 1940 there were 17,718 village schools with 1,896,374 pupils, 3,607 other primary schools (public and private) with 467,076 pupils, 41 secondary schools with 8,686 pupils, and various vocational and special schools. Higher education was given in the Technical College, Bandoeng, and in colleges of law, medicine, agriculture, science, literature, and philosophy at Batavia. About 20 per cent of all pupils attended missionary schools.

About 90 per cent of the natives are nominally Mohammedans and there are about 2,500,000 Christians and 1,000,000 Hindus. However all three religions are superimposed upon the prevailing spirit and ancestor worship.

Production, etc. Agriculture and mining are the chief occupations. The islands normally produced the following percentages of the world's annual yields: quinine 90, pepper 79, kapok 70, rubber 38, copra 30, oil palm products 20, tea 17, coffee 6, sugar 5. The islands were likewise a leading source of petroleum and tin. Bauxite, manganese, and coal were other mineral products. In 1941 6,000 factories and workshops were engaged in processing agricultural and mineral products for export. Foreign trade (1940): imports 444,300,000 guilders; exports 873,500,000 guilders (guilder = \$0.53). In prewar times the chief trading countries were: United States, British Malaya, Netherlands, Aus-

tralia, New Zealand, Great Britain, and Japan. Finance (1942 estimates): revenue 750,918,773 guilders; expenditure 813,802,815 guilders. The public funded debt (Jan. 1, 1942) totaled 1,233,839,000 guilders.

Government. Under Dutch rule, the islands were considered an integral part of the Kingdom of the Netherlands. The Government at Batavia handled only local affairs under the guidance of the mother country. There was a Governor General appointed by the Crown, assisted by an advisory Council of the Indies, a cabinet, and a Volksraad (legislative assembly) of appointed and elected members with limited legislative powers. The Netherlands Government appointed the 5 members of the Council of the Indies and 2 (the war and navy ministers) of the 8 members of the Governor General's cabinet.

Events, 1945. The end of the war with Japan brought no peace to Holland's far-flung empire in the East Indies. One after another, the large and populous islands that had been under Dutch rule for more than three centuries raised the standard of rebellion.

From the start, Java was the focus of unrest and the scene of the gravest disorders. Following the surrender of the Japanese forces on the island, native nationalist elements on Aug. 19 proclaimed the establishment of an independent "Indonesian Republic" under the leadership of Dr. Achmed Soekarno, President, and Dr. Mohammed Hatta, Vice-President. Although widely supported by the Javanese population, the move failed to win recognition either from the Dutch Government or from any foreign country.

The Dutch civil administration, which had been reestablished on Sumatra in August, proved unable to cope with the situation on Java. Britain, somewhat reluctantly, promised support and on Sept. 29 British and Indian troops landed at Batavia. The commander of these forces, Lt. Gen. Sir Philip Christison, made it known that he intended to occupy only two cities, Batavia and the important naval base of Surabaya. He also declared that "he did not wish to become involved in internal politics"—an obvious reference to the quarrel between the Dutch Government and the nationalist movement. Christison clearly indicated his desire to see the two parties get together at a round-table conference.

However, on Oct. 1 the Netherlands Government announced its refusal to deal with Soekarno whom it charged with being a tool and puppet of the Japanese. The Dutch press, at the same time, attacked General Christison's conciliatory attitude. It supported the Government's stand that there should be no departure from the policy laid down in Queen Wilhelmina's address of Dec. 6, 1942, in which she offered "complete partnership of the Netherlands Indies in the kingdom and complete freedom regarding its internal affairs." By contrast, Soekarno and his followers declared that they would accept nothing short of complete independence.

From this conflict ensued a long and uneasy stalemate that lasted up to the end of the year, with no early solution in sight. As the British slowly extended their grip on Java and the Dutch trained and equipped in the homeland a task force designed to restore Netherlands administration over the islands, widespread disorders occurred which eventually turned to open warfare.

On Oct. 15, Jonkheer A. W. L. Tjarda van Starkenborgh Stachouwer, Governor General of the Netherlands East Indies, resigned in an unex-

plained conflict of views with his Government. His successor, Dr. Hubertus J. van Mook, sought to make contact with the nationalist leaders but preliminary discussions brought no result, partly because Soekarno had already lost control over the Javanese extremists. These committed many acts of terrorism, including the slaying of hostages, and the murder of a British brigadier, A. W. S. Mallaby, on Oct. 31. In reprisal, the British resorted to such colonial strong-arm measures as the shelling and razing of native villages.

On Nov. 13, Sutan Sjahrir, 36-year-old Socialist leader, became Premier of the unrecognized "Indonesian Republic," while Soekarno retained the post of President, with little more than nominal powers. Sjahrir, expressing conciliatory views, attempted to bring hostilities to a halt, but he, too, was unable to curb extremist attacks on Allied forces and white civilians. On Nov. 29 the British finally captured Surabaya after several weeks of fierce fighting.

Strong extremist forces, however, remained entrenched in the interior of the island, taking little notice of the peace talks intermittently held between Sjahrir and Allied representatives. On Dec. 6 a conference was held at Admiral Lord Louis Mountbatten's headquarters at Singapore, attended by van Mook and Christison among others. It was decided to use strong measures to put an end to the "anarchy and disorders" in Java.

Meanwhile, sniping and skirmishes had also broken out on Sumatra, where all signs pointed to a further development of the crisis in the months ahead. From Bali, and other minor islands, growing unrest was also reported.

On Dec. 12, a dispatch from Batavia forecast "drastic action" by the British within the next two weeks if disturbances continued. Acting Governor van Mook, still hopeful of a peaceful settlement, left for the Netherlands on Dec. 15 to confer with his Government. On the same day, Sjahrir issued a statement declaring that the planned dispatch to Java of 27 Dutch battalions "will only make things worse in a situation which already is most tense."

Comparative quiet settled over Java during Christmas week, as reports from London indicated that the "strong policy" decisions of Singapore might not be endorsed there. A strong impression was made both at The Hague and in London by a statement issued on Dec. 19 in Washington, in which the State Department voiced "increasing concern" over developments in Java and urged all parties to resume negotiations. The United States Government, the statement said, looked toward a "peaceful settlement, recognizing alike the natural aspirations of the Indonesian peoples and the legitimate rights and interests of the Netherlands."

JOACHIM JOESTEN.

NETHERLANDS WEST INDIES. The colonial possessions of the Netherlands in the West Indies, comprising Curaçao and Surinam (or Netherlands Guiana), see below.

Curaçao. A Netherlands colony comprising two groups of islands 500 miles apart. One group just north of Venezuela includes Aruba (69 sq. mi.), Bonaire (95 sq. mi.), and Curaçao (210 sq. mi.); the other group just east of the Virgin Islands includes Saba (5 sq. mi.), St. Eustatius (7 sq. mi.), and the southern part of St. Martin (17 sq. mi.). Total area, 403 square miles. Population (Jan. 1, 1944), 122,540. In 1943 there were 3,893 births and 991 deaths. Willemstad (capital), on the island of Curaçao, had 36,437 inhabitants (Jan. 1,

1944). Chief products: refined oil (from imported crude oil), straw hats, phosphate of lime, and salt. Oil refining is the most important industry. Trade (1943), excluding petroleum: imports were valued at 345,000,000 guilders; exports totaled 298,000,000 guilders. Air services link Curaçao, Aruba, Jamaica, Trinidad, and North and South America. Shipping entered the ports (1941): 6,892 ships of 29,070,521 tons. Budget (1944): revenue 24,954,000 guilders; expenditure 24,942,000 guilders (the exchange value of the guilder was \$0.525 in February, 1943). Curaçao is administered by a Governor, assisted by a council of 4 members, and a States Council of 15 members (10 elected by the voters and 5 nominated by the Governor). Governor, Dr. P. A. Kasteel (appointed May 21, 1942).

Surinam (Netherlands Guiana). A colony on the northern coast of South America, belonging to the Netherlands. Area, 54,291 square miles. Population (Jan. 1, 1943), 186,807, including the Negroes and Indians living in the forests. Chief towns: Paramaribo (capital), 56,233 inhabitants, Nieuw Nickerie, 5,000, Albina, Coronie, and Moengo. Vital statistics (1943): 5,145 births, 2,480 deaths, and 738 marriages. Education (1943): 115 schools and 18,243 students. The principal agricultural products are sugar, rice, maize, coffee, cacao, balata, bananas, oranges, molasses, rum, and timber. Minerals produced included bauxite, gold, and salt. Trade (1943): imports 22,268,102 guilders; exports 14,173,267 guilders. Shipping (1943): 596 vessels of 3,408,941 register tons cleared. Budget estimates (1945): revenue 8,171,000 guilders, expenditure 8,167,000 guilders. The executive authority and administration are under a Governor, assisted by an advisory council. There is a representative body called the States of Surinam consisting of 15 members (5 appointed by the Governor and 10 elected by the voters). Governor (acting), Dr. J. C. Brons (app. Nov. 19, 1943).

NEW BRITAIN. The largest island in the Bismarck Archipelago in the Territory of New Guinea, mandated to Australia by the League of Nations. The island is 300 miles long and has an average width of 50 miles; area, 14,600 square miles. The native population of patrolled areas was 101,373 on June 30, 1940. Rabaul, the capital and chief port and settlement, had a non-native population of 4,674. There are many good harbors, the chief being Linden Haven, Powell Haven, Simpson Haven, Jacquot Bay, and Arawe. See NEW GUINEA, TERRITORY OF.

NEW CALEDONIA. A French island possession in the southwestern Pacific, 850 miles east of Australia. It is 248 miles long and has an average width of 31 miles. Total area (including dependent islands), 7,336 square miles. Population in 1942, 56,000 (20,000 whites and half-castes and the rest Melanesians and Polynesians). Capital: Nouméa (12,000 inhabitants). The dependencies of New Caledonia are: Isle of Pines, Wallis Archipelago, Fortuna and Alofi, Loyalty Islands, Huon Islands, Bélep Archipelago, Chesterfield Islands, and Walpoole. Chief agricultural products: coffee, copra, cotton, manioc, maize, tobacco, bananas, and pineapples. Mineral products include nickel, chromite, cobalt, iron, and manganese. Trade (1938): imports 158,571,000 francs; exports 146,453,000 francs (franc averaged \$0.0288 in 1938; \$0.0251, 1939). The local budget for 1939 was balanced at 44,100,000 francs. A Governor, assisted by a privy council and an elected general council, administers the government. Governor: A. Tallec.

NEWFOUNDLAND. An island lying between the Gulf of St. Lawrence and the Atlantic Ocean. Its dependency, Labrador, lies north of the Gulf of St. Lawrence, between the Province of Quebec and the Atlantic. Newfoundland, with Labrador, forms a part of the British Empire. Area, exclusive of Labrador, 42,734 square miles. Capital, St. John's.

Government. As a result of acute financial difficulties caused by the depression in the fishing industry, Newfoundland's status as a self-governing dominion of the British Commonwealth was temporarily altered in November, 1933, to that of a British colony. The British Government assumed responsibility for Newfoundland's financial obligations and provided an annual grant-in-aid pending restoration of the island treasury's financial solvency. Effective Feb. 15, 1934, executive and legislative authority was vested in the Governor and a Commission of 6—three Newfoundlanders and three British—all appointed by the British Government. Each member of the Commission has charge of a government department. Governor Vice Admiral Sir Humphrey T. Walwyn assumed office Jan. 21, 1936, for a three-year term which was successively extended by one-year terms to Dec. 31, 1945.

Events, 1945. The British Government's intention to set up in Newfoundland in 1946, as early as climatic conditions permit, an elected national convention of Newfoundlanders was announced in the House of Commons by Prime Minister Attlee on Dec. 11. Elections to the convention would be held broadly on the basis of the former Parliamentary constituencies, Attlee said, and all adults would be entitled to vote.

The convention would be presided over by a judge of the Supreme Court of Newfoundland, and its terms of reference would be as follows: To consider, and discuss amongst themselves as elected representatives of the Newfoundland people, the changes that have taken place in the financial and economic situation of the island since 1934, and, bearing in mind the extent to which the high revenues of recent years have been due to wartime conditions, to examine the position of the country and to make recommendations to His Majesty's Government as to possible forms of future government to be put before the people at a national referendum.

The reception of the announcement in Newfoundland was moderately favorable. In general, members of the economically secure classes favored responsible government, partly as a matter of prestige. Members of the middle classes and workers, remembering benefits from the present regime which would not have been gained under responsible government, were less enthusiastic. In such circles the inefficiency and alleged dishonesty of the former government was contrasted with the honesty and impartiality of the Commission. Informal polls of small groups showed either responsible government or commission government as a first choice, with confederation with the United States or Canada as a not unpopular step.

The departure of approximately 15,000 Canadian and United States servicemen by the middle of autumn failed to have the serious economic effect anticipated in some quarters, because of the presence of certain offsetting factors, such as the return of Newfoundland veterans from Europe, in some cases with families, and a high level of industrial activity which in turn maintained employment and purchasing power.

Codfishing, for centuries the sheet anchor of Newfoundland's national economy, was receiving

back many of the men who left fishing in the military-defense construction period 1941-1943. In prewar years as many as 30,000 fishermen were engaged at the season's peak. In 1942 the highest number was about 17,600, but by 1945 it was estimated at 24,000. Late in August the Newfoundland Fisheries Board announced the negotiation of a new contract with UNRRA for 200,000 barrels of hard-cure split herring in the 1945-1946 season. Before the war, herring exports were largely limited to about 20,000 barrels sold to the United States, with small lots to the West Indies and other markets. The UNRRA order was expected to help to make Newfoundland's transition from a prosperous war economy to a peace economy much easier than had been expected. Newfoundland's two pulp and paper mills were operating at capacity in the late summer of 1945, but the outlook had been altered by Great Britain's announcement of a possible curtailment of newsprint imports.

The People. The population of Newfoundland in 1943 was 335,877, as against 289,588 recorded by the census of 1935. The increase was due in large part to the establishment in Newfoundland of Canadian and American garrisons and bases. The inhabitants are mostly of English and Irish descent. Vital statistics for 1940 showed a considerable excess of births (7,937) over deaths (3,547). Labrador, with an area of 118,400 square miles, had a population of 4,716 in 1935.

From 7 to 10 per cent of the adults in Newfoundland are illiterate, but a school attendance act providing for free and compulsory education of children from 7 to 14 years of age, which went into effect in 1942, is expected to improve the situation. The schools (1,151 in 1943) are mainly denominational, but have public support. There are more Anglican schools and more Roman Catholic pupils than of any other single denomination. The census of 1945 showed the Roman Catholic and the Anglican as the leading religious denominations, with the Roman Catholic slightly larger. The United Church and the Salvation Army were the only other large groups.

Cod fishing is the occupation of two-thirds of the working people in normal times, but as products newsprint and wood pulp bulk large. With only 102,000 acres under cultivation, the total value of farm production in 1942 was \$4,600,000. Exports for 1943-1944 were \$44,000,000 and imports \$62,500,000.

ALZADA COMSTOCK.

NEW GUINEA. An island in the East Indies, north of Australia. It comprises Netherlands New Guinea (151,000 sq. mi.), North East New Guinea (69,700 sq. mi.)—the mainland part of the Australian mandated Territory of New Guinea, and Papua (87,786 sq. mi. excluding islands)—a Territory of Australia (formerly called British New Guinea). Total area, 308,486 square miles. Population, approximately 1,000,000. See NEW GUINEA, TERRITORY OF; PAPUA.

NEW GUINEA, Territory of. A territory administered by Australia under mandate conferred by the League of Nations from Dec. 17, 1920; occupied by Japanese armed forces during 1942-43; reconquered (by June of 1944) by the Australian and Allied armed forces. It comprises North East New Guinea (also called the Mainland), 69,700 square miles; Bismarck Archipelago (consisting of New Britain 14,600 sq. mi., New Ireland 3,340 sq. mi., Lavongai 460 sq. mi., and Admiralty Islands 800 sq. mi.), 19,200 square miles; and part

of the Solomon Islands (Bougainville 3,880 sq. mi., Buka and adjacent small islands 220 sq. mi.), 4,100 square miles. Total area, 93,000 square miles. Total enumerated natives in patrolled areas (June 30, 1941), 684,284, including 34,087 indentured laborers; in addition, there were 4,101 Europeans and 2,228 Asiatics. Rabaul (on New Britain), had 10,174 inhabitants in 1939. Chief towns of North East New Guinea: Aitape, Lae (capital of the Territory), Madang, Monumbo, Morobe, Salamaua, Vanimo, and Wewak.

Production and Trade. In 1940-41 the output of gold amounted to 263,097 fine ounces valued at £2,808,835. Platinum, osmiridium, copper, iron, sulfur, and brown coal have been found. The area under cultivation in 1940 (exclusive of native reserves) was 277,533 acres, of which 261,676 acres were devoted to coconuts (71,583 tons of copra produced in 1940), cocoa 5,827 acres, rubber 2,481 acres, and coffee 2,792 acres. Livestock (1939-40): 20,474 cattle, 9,327 goats, 6,160 pigs, 1,184 sheep, and 1,323 horses. Timber and fish are other products. Trade (1940-41): imports £962,129; exports £3,253,984. Shipping (1940-41): 95 vessels aggregating 216,365 tons cleared.

Government. Finance (1940-41): revenue £423,750, expenditure £431,792 (the official exchange rate of the Australian £ was \$3.228 in 1940, 1941, and 1942). In 1945 the territory was under the control of the Australia New Guinea Administrative Unit (Angau.) Administrator: Maj. Gen. J. K. Murray.

NEW PLANTS FOR THE UNITED STATES. Production gains on American farms in the war years resulted from a speed-up in the application of plant-science to agricultural operations, as well as from increased farm mechanization and fuller use of available manpower.

The emergency brought both innovations and greater use of previously available scientific knowledge. Plant-science devoted to the development of important crops gave higher yields, greater resistance to disease, better adaptation of crops to specific requirements, and other advantages. Co-operative work by the Department of Agriculture and state agricultural experiment stations made more than 100 new varieties of crop plants available to growers, in most cases as the fruit of investigations started long ago, but sometimes as the result of emergency experiments.

Conspicuous among the developments with a prewar origin was an increase in the number and usefulness of hybrid corn varieties. Hybrid strains produced by the crossing of inbred lines enabled Corn Belt farmers to grow 20 percent more corn on a given acreage than would have been obtainable from the use of open pollinated varieties. The spread of hybrid corn to the South and other areas began with varieties specially developed for that purpose.

Since 1941 the planting of hybrid varieties has added probably two billion bushels to the quantity that other varieties would have given. Corn in 1945 was a three billion bushel crop for the fourth year in a row; yet the planted acreage was only 94,140,000, as compared with 101,360,000 acres required to produce a three billion bushel crop in 1920, the biggest prewar corn year. Land released from corn went largely into soybean production, likewise from scientifically bred seed. Soybean production jumped from 77½ million bushels in 1940 to nearly 200 million bushels in 1943.

Plant specialists developed the first commercially

feasible onion hybrid. Announced in the spring of 1944, this onion produced yields about 25 percent larger than the best varieties previously grown; moreover, some of the hybrid onions were of giant size—up to 4 pounds. This achievement involved the production of onions with sterile pollen, which could be planted in alternate rows with normal, pollen-producing onions. Seed was collected only from the male-sterile plants. The first hybrid onion released for production is adapted only to the Southwest, but hybrids are being developed for other areas. Moreover, the plant breeders hope by similar methods to develop hybrid vigor in other crops. For example, they have found male-sterile grain sorghums that give promise of facilitating the production of useful hybrids. Alfalfa sometimes produces plants sterile to their own pollen, and consequently favorable for hybridization experiments.

Small grains show the results of wartime efforts to create better varieties for specific areas. These researches have chiefly sought to produce varieties resistant to disease and to insect pests, but other values such as quality and adaptation to farm practices have been developed also. Early varieties of wheat have shown increased power to escape damage. Thus Wichita, a new, very early-maturing variety of hard red winter wheat, has been approved for distribution in southwestern Kansas, western Oklahoma, and northwestern Texas. Besides producing high yields of good quality, heavy grain, it helps by its early maturity to distribute labor through the harvest season. In southwestern Nebraska and eastern Kansas the distribution of Pawnee hard red winter wheat gives high hopes of reducing losses from the Hessian fly.

New rust-resistant varieties of wheat, oats, and barley developed by the Texas station, in cooperation with the Department, are especially adapted to the soil and climatic conditions that prevail from central Texas to the southern tip of the State. Austin wheat, first released in 1942, Ranger and Rustler oats, released in 1941, Verde oats, first released in the fall of 1942, and Tunis barley, distributed first in the fall of 1943, contributed food and feed to help win the war.

Vicland, a new disease-resistant variety of oats, released by the Wisconsin station, was grown on about 50 percent of the State's 1943 oat acreage. Wisconsin farmers produced 5,000,000 bushels of Vicland in 1942. Vicland averaged 78 bushels per acre in 1942, as compared with 53 bushels for other oats on farms throughout Wisconsin. Ohio-gold No. 1, a new yellow hybrid sweet corn developed by the Ohio station, was offered to the growers for trial in the 1944 season. This new variety in a 3-year comparison with Golden Cross Bantam outyielded the latter by 18 percent, ripened 6 days later, and was rated sweeter in flavor.

New varieties of oats have made the oats crop much more dependable. In the North Central States, when rust is not bad, the new varieties increase the yields by an estimated 10 or 15 percent. In bad rust years they increase the yields by as much as 100 percent over what would be harvested from the old varieties. Many improved barley varieties have been introduced, and also new stiff-stalked, disease-resistant grain sorghums adapted to combine harvesting.

Constantly the plant scientists endeavor to develop better cottons, in response to a demand for varieties capable of meeting the competition of other fibers both natural and synthetic. They depend heavily for the application of their results on progress in building up one-variety communities.

One-variety programs have been launched in more than 2,500 cotton-growing communities, whose total area in cotton exceeds 9 million acres. Varieties that produce stronger fibers have been produced for the Mississippi Valley and for the southeastern states. Many one-variety communities use them in standardized production. In New Mexico and west Texas the new variety of cotton called Acala 1517 is in general production. This variety is stronger than any other of its length. One-variety communities in Georgia have started the production of a new variety of cotton called Empire, and other new varieties are making headway in other areas.

In the war years the Department's drug plant gardens provided information and propagation materials that served to start the production of drug crops in the United States and elsewhere. Among them were belladonna, digitalis, and pyrethrum. Promising results attended the breeding of devil's shoestring, the only native plant found to yield any substantial amount of insecticide. Widely distributed throughout the eastern and Gulf Coast states, it produces individual plants that contain as much as 2 percent rotenone. Breeding and selection have produced a population of the plants which consistently yields about 2½ percent rotenone in the roots. This insecticide, nonpoisonous to man, has heretofore been imported from tropical countries. In specimen gardens at Beltsville, Md., the Department has assembled propagating material for numerous drug, condiment, and oil-yielding plants, and has made observations of their behavior and growth habits.

In California's Imperial Valley a new cantaloup called No. 5 and released in 1942 by the Department and the California Experiment Station has virtually supplanted No. 45, the variety previously in general use. Though No. 45 was resistant to one form of mildew, it succumbed after a few years to another form. The new variety No. 5 is resistant to both forms. Growers produced a seed crop of it immediately—enough to plant several thousand acres in the spring of 1943.

The vitamin-high tomato, our third most important vegetable crop, has been improved greatly in its power to resist disease. One new variety, Pan America, is highly resistant both to fusarium wilt and to nailhead spot. In greenhouse tests in 1943 it proved nearly 100 percent resistant to fusarium wilt.

The Missouri station found that seedless tomato fruits of better size and quality than those from normal pollination can be produced if the pistil of a tomato flower is treated with a salve made by mixing with lanolin the residue from a crude alcoholic extract of corn kernels taken 10 to 15 days after the silks first emerge from the ear. The activity of this extract surpassed that of any synthetic chemical known to induce seedless fruit. The Early Chatham, a new extra-early variety of tomato, has been released by the Michigan station. It matures at least 1 week earlier than other common varieties of that area, and this earliness makes it particularly adapted to the Upper Peninsula and other areas of that latitude. It originated from a three-way cross, Break O'Day X Redskin X 216 (an unnamed selection).

The Wando pea, announced in 1943, proved highly resistant to cold, and consequently valuable for market crops in areas liable to untimely freezes. In the vegetable breeding laboratory at Charleston, S. C., it resisted a cold snap that cut other varieties to the ground. Wando lost only its blossoms, which it soon replaced. The Pioneer Bean, the first variety

of snap bean that proved resistant to curly top disease, far outyielded other varieties in irrigated areas of Washington, Oregon, and Idaho, where the curly top disease is prevalent. Farmers praised its quality, flavor, and appearance.

Two new varieties of cigarette tobacco, No. 400 and No. 401, have recently been introduced in the flue-cured areas. They make good yields with a high percentage of the leaf grades now in keen demand. The variety No. 400 produces large yields of cigarette leaf on the soils of the Piedmont and is resistant to black root rot. The variety No. 401 does well on the Coastal Plain and has two striking advantages. It has an exceptionally big leaf and can be grown without loss of quality under the more intensive methods such as those that include soybeans or peanuts in the crop rotation.

Tobaccos resistant to blue mold have been developed through the use of resistant wild varieties. Some crosses with wild species have produced plants that are highly resistant to wild-fire and other destructive tobacco diseases. The crossing of cultivated with wild tobacco is a slow process because few of the crosses produce seed. But those that do may have the chromosomes of both parents with the result that they continue the desirable qualities of the cultivated varieties along with the disease-resistance of the wild varieties.

Most important of the hard fibers is abaca (Manila hemp). Abaca furnished the raw materials for all high-grade rope, especially marine rope. Produced formerly only in the Orient, the war cut off our supply. Fortunately the Department had made some preparation for this emergency. In 1925 it had brought a shipment of about 1,000 carefully selected abaca plants from the Philippine Islands to the Republic of Panama. Experimental plantings showed that the climate and the soil of Panama were favorable for this plant, and that in its new home it would produce fiber of excellent quality. These plantings, expanded first to 50 acres and afterwards to 2,000, provided an abundant supply of propagating material. A large acreage of abaca is now being produced both in Panama and in Costa Rica. Abaca will be produced in these two countries in steadily increasing quantities, and in other countries of Central America.

ARTHUR P. CHEW.

NEWSPAPERS. The war's end, coming with unexpected suddenness, made little change in the newspapers' preoccupation with their main problem, the supply of newsprint. The limited tonnage available through the war period, controlled in the United States by the War Production Board on a prescribed individual quota basis, had been a strait-jacket on news, circulation, and advertising; though this limitation seemed an easy one by comparison with newsprint available in foreign lands. Government control of newsprint, except for inventories, ceased at the year end. No prospect of increased tonnage seemed likely for six months at least. Some publishers asked continued control, fearing that small newspapers might find themselves squeezed from buying in a competitive market. A voluntary limitation on use was established, however, and newspapers generally signed a pledge to put 3 per cent of their tonnage in a pool, if necessary, to prevent any suspensions of publication.

On the news side the editors turned from the reporting of war to covering a world in the difficult tasks of political and economic reconversion. Concentration on a dominant story of hostilities gave way to an effort to give the news of the much more complicated events, domestic and foreign, which

followed immediately on the German and Japanese surrender.

Censorship stopped promptly in the United States. In the occupied enemy countries the newspapers, formerly under the thumb of dictators, were licensed and controlled by the military occupation authorities. By a swift turn of the wheel, they were compelled to print news favorable to democratic principles, and reveal the truth about the cruelties and grave misdeeds of their former rulers.

On the whole newspapers enjoyed a prosperous if troubled year. Newsprint quotas were increased slightly but the price was raised \$3 a ton, and a further increase of \$6 was announced in December, the two advances meaning an additional expense in excess of \$30,000,000 a year to United States newspapers. Canada, the main source of supply, was expected gradually to increase its exports as manpower returned to the mills; but the alarming prospect was for a rapid decrease in United States production since paper makers turned to more profitable and higher priced book and magazine stock. No hope was seen of a supply from the Scandinavian countries, which sent such tonnage as they were able to make to Russia and the liberated countries. The newspapers in these lands had to be content with little more than a trickle. The British newspapers, which during the war had been held to 17 per cent of peacetime use, expanded their consumption only to 28 per cent so as not to put a strain upon Britain's foreign financial obligations. Efforts were being made to establish a second newsprint mill in the Southeastern United States to add to available tonnage, for newspapers foresaw a great need of paper to meet the demands of readers and advertisers and to reap the benefits of expected business activity and prosperity.

Ending of the voluntary wartime news censorship in the United States—which had worked admirably—coincided with a wide-spread interest in a free press, or at least free access to news by American correspondents in other lands. There had been difficulty with Army and Navy censorship in many theatres, but scarcely more than was to be looked for in so far-flung a war. The most sensational incident was the premature sending of the news of the Germans' signing of the surrender by a correspondent of the Associated Press. The dispatch was forwarded by telephone to London before the Army approved release, and before the other correspondents who witnessed the surrender had been permitted to file their stories. SHAEF authorities disciplined the correspondent, and the Associated Press publicly stated its regrets at the violation of an understanding concerning the anticipation of this important news.

Strong support was given to various proposals in favor of a free press throughout the world, and freedom of communications. A well-intended if mistaken effort was made in Congress to limit UNRRA aid to countries which permitted correspondents to report news without interference, but this was finally eliminated. At the third Pan American radio conference in Rio de Janeiro the United States, through the Assistant Secretary of State, urged access to news sources in all nations. The House and Senate had unanimously adopted a resolution expressing "belief in the world wide right of interchange of news by news gathering and distributing agencies, whether individual or associate, by any means, without discrimination as to sources, distribution, rates or charges; and this right should be protected by international compact." American delegates to the UNO meeting

were instructed by the State Department to push for a prompt international study aimed at promoting freedom of the press in all countries.

More than resolutions would be required, it was evident, to gain a measurable approach to such freedom. Even Gen. MacArthur arbitrarily sought to limit the number of correspondents permitted to report the news from Japan and Korea. After vigorous protest the quota system was revoked. The Chungking Government of China listed a number of well-known correspondents as not acceptable. The fascist-minded forces in the Argentine used violence and intimidation to prevent unbiased news correspondents from telling the world the truth. Russia allowed foreign news writers to visit its occupation zone in Germany only months after the surrender; and correspondents in Moscow were hampered in their work. Writers were harassed or expelled in Egypt, Palestine and elsewhere. True freedom of the news seemed some distance away.

Newspapers had reported the war with extraordinary enterprise. Correspondents displayed the greatest bravery in accompanying the armies and navies in the fighting; and because of aerial bombing there were no safe assignments. Allied headquarters in Europe announced that between 4 and 5 percent of correspondents had been casualties in the 11 months' campaign leading to the German surrender, compared with 19 percent for the combat ground forces. There had been 1,388 correspondents accredited to SHAEF and about 1,000 had actually served. Of these 14 had been killed, 27 wounded, and 3 were missing. A number had been captured and held in Nazi prison camps, and Joe Morton, of AP, was executed by the Germans. In the Pacific the casualties were not so numerous, though higher than in any previous war.

All newspapers made plans to cover the news of the postwar world on a scale never before known. One of the results of the first world war had been to increase readers' interest in and knowledge of foreign affairs, and the papers had responded to this demand. It was apparent that the United States would have great responsibilities in world affairs and the newspapers would be looked to for information of current events in this field. Bureaus were promptly opened, or reopened, in foreign capitals by leading metropolitan journals. Many war correspondents quickly turned to the reporting of political developments. Steps were taken to improve communications, to seek lower tolls which would enable a wider flow of news between nations, and to free the gathering and forwarding of news from control of any censorship.

Of outstanding interest was the decision of the United States Supreme Court, by a vote of 5 to 3, upholding the anti-trust action brought by the government against the Associated Press' cooperative news-gathering agency. The AP, the court held, was under legal compulsion to serve competitors of present members whose applications otherwise were acceptable. It was required to alter its bylaws. After a petition for rehearing had been denied, the AP elected to membership several important newspapers, notably the *Chicago Sun*, which had sought membership for some time, and revised its bylaws governing election of new members.

Justice Black, in the majority opinion, stated that the Government had charged that the AP was "(1) a combination and conspiracy in restraint of trade and commerce in news among the states and (2) an attempt to monopolize a part of that trade." The bylaws, he said, prohibited all AP members

from selling news to non-members, and granted each member powers to block competitors from membership. The lower court had enjoined the AP against observing any bylaws which would give members in the same city and field (i.e. morning or evening) powers to impose any conditions upon the admission of an applicant. The Supreme Court upheld this decree. It dismissed the contention that publishers engaged in practices made unlawful by the Sherman Act were entitled to a partial immunity by reason of any "clear and present danger" doctrine which the courts had used to protect the freedoms of speech, press and religion.

The dissents of Justice Roberts and Chief Justice Stone were vigorous. They said the decision converted the AP into a "public utility," subject to the duty to serve all on equal terms. They declared that the lower court "has been unable to find support for a conclusion that the AP either intended, or attempted to, or in fact did, unreasonably restrain trade or monopolize all or any part of any branch or trade." Justice Murphy feared that the decision would lead to "unjust and more drastic" measures on the part of government to control the press. The court remarked that when Congress had intended to exempt any cooperative undertaking from the anti-trust law it had done so explicitly, and some publishers advocated asking Congress to pass legislation in favor of the AP.

What the eventual results of the decision would be upon the membership—whether it would lead to a rush of applicants when newsprint supplies became available—was not immediately clear. The AP continued to make plans for expansion of its world news service and the directors placed a fund of \$1,000,000 a year at the disposal of the general manager to develop the service. Expenditures for gathering foreign news had increased to \$2,000,000 a year, compared with \$2,799,000 for domestic news.

The number of newspapers in the United States showed comparatively little change in the year.

Circulation rate increases for carrier delivered, mail subscription, and single copy sales were numerous, and no reduction in circulation resulted. The general trend toward obtaining a larger portion of a newspaper's total income from circulation was continued. This was regarded as a healthy development, for it had long been recognized that some rates, particularly those for mail subscriptions on RFD routes, had been unjustifiably low. The Bureau of Advertising of the American Newspaper Publishers' Association issued a statistical estimate that the people of the United States spent in a year \$727,880,000 for newspapers, \$311,773,000 for magazines, and \$306,379,000 for books. An interesting survey of the important weekly newspaper field made by the American Press Association showed that 68 per cent had more than 1,000 circulation. A total of 756 had more than 3,000 circulation, 1,533 had between 2,000 and 3,000; and in the lower brackets 3,294 had 1,000 and 2,000 circulation, and 2,594 had less than 1,000.

The annual compilation of *Editor & Publisher* listed at the year-end 330 morning newspapers in the English daily field (a decrease of 8); 1,419 evening newspapers, a decrease of 2; and 484 Sunday newspapers, an increase of 3. Total circulation of morning newspapers was 19,239,913 and of evening 29,144,275. The combined total reached the unprecedented figure of 48,384,188 copies. The circulation of Sunday editions totalled 39,860,036. Statistics issued by the American Newspaper Publishers Association, on the other hand, showed that

ten new dailies had begun publication and only 8 had suspended. Weekly or semi-weekly newspapers, according to the directory of the American Press Association, numbered 8,504 a decrease of 223. Total circulation of this group was set at 14,321,000 an increase of 165,000 in the year.

Discussion of the long term trend toward fewer newspapers continued. Prof. Raymond B. Nixon in the *Journalism Quarterly* presented an interesting table covering the years 1929-1944, as follows:

SUSPENSIONS OF ENGLISH-LANGUAGE DAILY NEWSPAPERS OF GENERAL CIRCULATION IN THE UNITED STATES, 1930-1944

Year	Out- right Sus- pen- sion	Merged and Dropped	Daily to Weekly, etc.	Total Sus- pen- sions	Total Dailies Dec. 31	Circu- lation Sept. 30
1929					1,944	39,425,615
1930	22	14	2	38	1,942	39,589,172
1931	26	19	7	52	1,923	38,761,187
1932	22	20	6	48	1,913	36,407,297
1933	23	15	7	45	1,911	35,175,238
1934	18	5	8	31	1,929	36,709,010
1935	11	6	4	21	1,950	38,155,540
1936	15	6	4	25	1,989	40,292,266
1937	22	17	12	51	1,993	41,418,730
1938	24	16	12	52	1,936	39,571,839
1939	30	7	24	61	1,888	39,670,682
1940	15	8	11	34	1,878	41,131,611
1941	15	10	8	33	1,857	42,080,391
1942	20	10	18	48	1,787	43,374,850
1943	8	10	9	27	1,754	44,392,829
1944	5	2	3	10	1,744	45,954,838
	276	163	135	576		
Net Loss in Number of Dailies in 15-Year Period						200
Gain in Total Circulation						6,529,223

Discussion in this field emphasized the tendency toward elimination of newspaper competition. Prof. Nixon asserted that there were 174 cities in which "full or partial combination of all local dailies potentially eliminates competition." It is worthy of note, however, that in many places where newspapers under different ownership had joint business management, the news and editorial departments remained strongly independent and competitive.

Advertising volume, restricted by the limitations of newsprint supply, was approximately 1 per cent greater than in 1944, but the gain in the later months was increasing. The total volume was still some 25 per cent less than in the peak year 1929, but it was generally agreed that a tremendous volume of advertising would be offered as soon as civilian production of consumers' goods was large enough to create competition. Increases in advertising rates, to meet increased expenses, had been general. An interesting development was an organization of an association of substantial newspapers to sell black-and-white advertising in daily editions in a group "package." Many minor attempts to organize such a group had been made before, but had been successful only in the Sunday rotogravure, comic or magazine supplements. Progressive publishers believed that this group selling of space would be an important factor in the future. L. H. D. Weld, a recognized statistical authority, stated that in 1944 newspapers had carried 45.2 percent of the total dollar volume of advertising in the United States. Of the \$1,426,000,000 total, the newspapers had carried \$645,000,000, radio \$400,000,000, magazines \$285,000,000, outdoor (billboards, etc.) \$70,000,000 and farm journals \$26,000,000. A court decision in New York upheld the right of newspapers to refuse any advertising which they thought undesirable for any reason, and to edit copy in advertisements.

This right had always been asserted by newspapers in their rate cards, but an advertiser who had wished to state that his establishment declined the patronage of certain religious and racial groups took the matter to court.

The labor situation in the newspaper field deteriorated as in other industries. The postwar economic strains were felt in all labor negotiations and strikes were more frequent than in many years past. Prolonged strikes took place in New York, St. Louis, Seattle, Birmingham, Newark, and many other cities. Many labor unions rejected summarily the principle of arbitration which before had been an accepted method of settling disputes in the newspaper world. Removal of the so-called "Little Steel" formula, which had held wage increases to 15 per cent over the January 1941 scales, threw the adjustment of pay wide open. Under threats of strikes the scales, already the highest in any industry, were advanced more substantially than in any previous year, and important changes in working conditions were added as well. Weekly pay increases of from \$6 to \$12 for a work week of 35 to 40 hours were general. Publishers objected strongly to the new international laws of the typographical union, which, in their opinion, would give the officers of the union power to set aside a contract already agreed upon. In all 70 newspapers in 37 cities were affected by strikes in the year. Of these 32 had been initiated by the typographical union.

A report of the ANPA labor committee listed 151 contracts with the American Newspaper Guild covering 165 newspapers, an increase of 10 contracts and 7 newspapers in the year. Of the contracts 72 covered news and commercial departments, 64 news and editorial only, and 15 commercial only. These contracts were effective in 95 cities. The Guild announced that its membership was now in excess of 22,000.

With the great increase in the cost of newsprint and the advances in wages, it was evident that newspaper publishing was to be considerably more expensive in the future, and that management would be taxed to find operating economies which would go any appreciable way toward meeting the higher costs.

Newspapers abroad faced difficult problems in the war-impoverished Allied countries where resources and supplies were limited; in the liberated and conquered nations there were questions of licensing and control by the occupying authorities. The first German newspaper to obtain the right to publish was the weekly *Nachrichten*, in Aachen, licensed in June. The task of the American authorities was to develop an anti-Nazi staff which could be trusted. Licenses were issued cautiously, and in October there were 14 newspapers in operation, with a circulation of 1,750,000 copies. A convention of the editors was held, the first meeting of a free press in Germany in 12 years. They asked for full and accurate news of the world as the best antidote to Nazism.

In France the government went a long way toward ending all censorship of the press. An interesting incident was the public rebuke of the French press by President Truman for the bias of its news concerning the United States. A warm debate on the degree of freedom enjoyed by newspapers in Russia was begun by Kent Cooper, General Manager of the Associated Press, when he remarked that after the war, nine-tenths of the countries of the world, excepting the Soviet Union and China, would uphold the principles of freedom of the press. The Russian publication, *War and the*

Working Class, replied vigorously asserting that the press in that country was free in that it represented the masses of the people. In other countries, the Soviet magazine asserted, the press was under business control, and although nominally free by law, the broad masses had no opportunity to finance and publish their press. The article further declared that Russia in 1913 had had 859 newspapers with a circulation of 2,700,000 and in 1939 had 9,000 with a circulation of 38,000,000.

In Japan Gen. MacArthur had great difficulty in getting an approved Japanese press in operation. The great Japanese newspapers before the war had been among the most prosperous and enterprising in the world, but had largely been spokesmen for government opinion in their news and editorial columns—or at least had done little as spokesmen for the people. The Domei News Agency even after the occupation distributed propaganda stories of American "brutalities." Gradually, however, under a censorship, the newspapers were put in some semblance of a democratic press. Premier Shidehara promised freedom and said that his government would welcome objective and impartial news and unreserved expression of the popular will.

The British journals, limited to the use of 28 percent of pre-war tonnage of newsprint, encountered troubles in rehiring of staffs, hardly needed for such small issues. Great hopes of expansion when world trade was resumed were expressed, but little progress had been made by the year's end.

In South America, particularly in the Argentine, there were recurring instances of censorship and intimidation of independent editors by government. The Peron regime in Buenos Aires was especially anti-democratic in its treatment of the press and foreign correspondents.

Proposals for severe increases in second class postal rates—eventually to reach some 600 per cent over present rates—were advanced by a cost accountant employed by the United States Post Office Department to study the subject. The proposals did not reach the stage of legislation, but publishers the country over were aroused over the prospect of a struggle to prevent increases which would stifle mail subscriptions. They were prepared to challenge the basis of the allocations of post office costs in the study, particularly those of RFD costs, and to present a good argument on the services of the newspapers in disseminating news to the citizens. A gratifying development was the decision of the courts in the *Esquire* case, holding that the Postmaster General did not have the right to deny second class postal privileges to a publication because it did not conform to his standards and taste in matters alleged to be obscene.

Newspapers showed increasing interest in ownership of radio stations, especially the new FM stations soon to be in operation. The area of broadcasting of these stations would correspond roughly to the local and suburban coverage of newspapers. Some 40 per cent of the 665 applications filed for these stations were from newspapers.

Expansion plans of newspapers in plants and equipment had been halted by the war. The surrender of the Axis nations let loose floods of orders for presses and other equipment, and many newspapers announced extensive enlargements of their buildings. Great technical improvements were expected in the printing of newspapers, and a wider use of color in the daily editions.

The American Newspaper Publishers Association appointed a special committee on Press Communi-

cations. The members were concerned over proposals to establish greater government control over international communications, to change or limit the radio frequencies reserved for the exclusive use of the press, thereby forcing the newspapers to employ the inadequate and more costly cable service. It seemed likely that a considerable degree of monopoly in international telecommunications might be in the offing and this appeared to be a danger to broader publication of world news. However, the United States and Britain at a conference in Bermuda in December agreed to establish lower rates and to provide speedier transmission for news dispatches.

The fine record of the news services in reporting the war was marred by a premature announcement by the Associated Press of the German surrender, on the basis of a statement by Senator Connally at the San Francisco Conference; and a false "flash" dispatch sent over the wires of the United Press announcing Japan's acceptance of the surrender terms. The flash originated with some mischief maker in a newspaper office, and was announced on the radio. It was killed before it was published in any newspaper. A reward of \$5,000 was offered for the detection of the sender.

Foreign language newspapers in the United States continued during the war, apparently with complete loyalty to democratic principles. There was no "witch hunt" by the government, and even the German language newspapers suffered no loss. The foreign language newspapers numbered 1,076. The continued existence of these newspapers, which had been expected to disappear as immigration into the United States lessened, was surprising to many in the journalistic world.

A number of men and women prominent in newspaper making died in the year, among them Ernie Pyle, famous war correspondent, killed on Okinawa; Carr V. Van Anda, former managing editor of the *New York Times* and generally acknowledged as the foremost news executive in the history of journalism; O. K. Bovard, formerly managing editor of the *St. Louis Post Dispatch*; Victor Hanson, publisher of the Birmingham, Ala., *News and Age Herald*; J. V. Connolly of the King Features Syndicate; M. Koenigsberg, former head of the International News Service; Alexander Dana Noyes, financial editor of the *New York Times*; and Marie Gasch, who wrote a column of personal advice under the name of Beatrice Fairfax.

CHARLES MCD. PUCKETTIE.

NEW ZEALAND. A British Dominion in the South Pacific Ocean, consisting chiefly of two large islands about 1,200 miles east of the southeastern coast of Australia. The Dominion has jurisdiction over Western Samoa (League of Nations mandate), Tokelau or Union Islands, some islands of Oceania and the Ross Dependency. Area, 103,723 square miles. Capital, Wellington.

Government. Executive power is vested in a Governor General, appointed by the Crown for 5 years on recommendation of the Dominion Government. Legislative power rests with a Parliament of two chambers—the Legislative Council with an indeterminate number of members (36 in 1943) appointed by the Governor General for 7 years, and the House of Representatives of 80 members (including four Maoris) elected by general male and female suffrage for three years. The Governor General delegates his executive powers to a Cabinet responsible to the House of Representatives. Governor-General in 1945, Sir Cyril L. N. Newall, sworn in Feb. 22, 1941.

The standing of the parties in the House of Representatives following the general election of Sept. 25, 1943, was as follows: Labor, 45; National, 34; Independent, 1. The Labor Party has been in control of the Government since Dec. 5, 1935. Prime Minister, Peter Fraser, appointed April 30, 1940.

Events, 1945. Soon after the surrender of Germany a relaxation of wartime controls began. At the end of June the Minister of Industrial Man-Power announced that wives of returned service men and married women over 40, widows of servicemen and persons under 18 could now choose their own employment. Early in July nearly 200 businesses were removed from the essential list. Demobilization began on Aug. 18, immediately after the end of the war with Japan, with especial attention to the needs of the farm year just beginning. On Aug. 21 the War Cabinet was dissolved and the two non-Labor members resigned. Postwar defense plans were still incomplete at the end of the year, pending an understanding with Australia on regional defense needs and a knowledge of the demands to be made by the United Nations Security Council.

Participation at San Francisco. Prime Minister Peter Fraser attended the meeting of Commonwealth representatives in London in April to discuss the Dumbarton Oaks proposals and other questions connected with participation in the San Francisco Conference by members of the British Commonwealth. At San Francisco Fraser took an active part in the conference on behalf of his country and as an exponent of the rights of small nations in general. New Zealand insisted as long as possible that the proposed Assembly should have veto action over the Security Council. Fraser supported the Soviet Union in asking delay in seating Argentina. Throughout the deliberations New Zealand insisted on expanded functions for the proposed Economic and Social Council.

The Prime Minister returned to Wellington from San Francisco on July 6, well satisfied with the changes made at San Francisco. After a three-day debate the New Zealand House of Representatives ratified the United Nations Charter and the Statute of the International Court of Justice on August 7.

Parliament in Session. The session of the New Zealand Parliament which was opened on June 27 by Governor General Sir Cyril Newall was important and eventful, with new political strains evident and socialization programs under consideration. For the first time in its almost 10 years of power the Labor Party faced an organized group of opponents. The new united front included the National Farmers' Federation, the National Employers' Federation, the New Zealand Manufacturers' Federation and the Associated Chambers of Commerce. The purposes of the alliance, as defined in a preliminary statement, were to fight the trends towards what was defined as national socialization. New Zealand business men had for some time been trying to decide on the most effective grounds of opposition to the Labor Party, and the farmers were a perennially dissatisfied group. In 1945 the antagonism of the latter was brought to a head by the Government's announcement of a move against the "country quota," a curious survival from the last century when rural interests forced a law providing that rural communities should have their voting strength raised by adding 28 per cent to their population when electoral districts were being redefined after each census.

The bill to nationalize the Bank of New Zea-

land by having the Government purchase the shares was introduced in the House of Representatives on Oct. 31. Private shareholders could take cash or Government securities in return, and their income from the latter would be the same as before the exchange. Directors would continue in office but would be required to have regard to the representations of the Minister of Finance and to Government decisions conveyed by him. The rights and privileges of the staff would be preserved.

This proposal was not a new one; it had, in fact, been outlined by Minister of Finance Walter Nash on the preceding March 31; but the discussion was animated. The New Zealand Chambers of Commerce issued a warning against the measure on Nov. 10, saying that the Bank's fate, and the fate of other banks with it, was sealed, and that the prophets of "funny money" had emerged triumphant. A two-day debate in the House of Representatives was marked by opposition members howling down Nash when he spoke beyond his time, so that the rest of his speech appeared as a handout to the press. The bill was passed on Nov. 22.

At the same time a bill for the nationalization of New Zealand airways was introduced. It provided for the formation of the New Zealand National Airways Corporation, which would in reality be a department of the Government. The initial capital of £1,000,000 would be furnished by the Government and the corporation would have the power to borrow £500,000 more from the same source. The terms on which existing air services were to be acquired were not specified in the bill, but the corporation was given power of compulsory acquisition on terms decided by negotiation or arbitration.

The National Labor Party Conference in its November session moved even further along the road to socialization. The Conference recommended that the Government create collective and cooperative farms and also demanded that all farm lands not in full production be taken for war veterans.

When the long session ended on Dec. 7 the record showed the battle over nationalizing the Bank was exceeded in liveliness only by that of the "country quota." The National Party and the Farmers' Union utilized every possible expedient to halt the bill, but they were defeated. Labor replied that it was essentially democratic to insure equality in voting.

The Trade Problem. In the closing months of the year New Zealand was intensely occupied with maintaining the export position so vital to its economy. When it was first rumored that the United States would make a loan to Britain conditional on the abandonment of empire preference, New Zealand was one of the Dominions which protested promptly. Finance Minister Nash told the press on Oct. 10 that trading and other relations with Great Britain were so good that New Zealand would not disturb them except to improve the volume of commerce all round.

The Government's licensing system for 1946, made public on Nov. 4, virtually eliminated United States goods from the New Zealand market and gave heavy allocations to Britain. Many items which the United States was accustomed to export were classified under "United Kingdom and Australia 100 per cent of 1945. Canada and United States deferred." The Minister of Customs stated that the policy of obtaining New Zealand's requirements from the United Kingdom to the maximum possible extent would be continued. He indicated that there was uncertainty and possibly

some difficulty in buying from non-sterling areas.

New Zealand's commodity trade position was favorable in 1944-45, and the official action taken late in 1945 indicated an intention to keep it so. Exports jumped from £74,000,000 in the preceding year to £85,000,000, while imports increased only from £28,000,000 to £31,000,000. In view of the country's trading relationships, this meant that New Zealand's holdings of sterling exchange were now large. Details of a four-year contract for Britain to buy New Zealand's exportable surplus of meat were announced early in November.

Other Events. Sir Bernard Freyburg, Commander of the New Zealand Army Corps, was named in September to succeed Sir Cyril Newall as Governor General at the expiration of the latter's term of office in February, 1946. Sir Patrick Duff took up his duties as British High Commissioner in New Zealand in the middle of the year, succeeding Harry Batterbee. Kenneth S. Patton, United States Minister in New Zealand, left Wellington in October to accept another assignment. Avra Warren, who has held several important diplomatic posts in Latin America, was appointed to succeed him.

The Population. The population of New Zealand was estimated at 1,643,909 in March, 1944. Western Samoa, with an area of 1,133 square miles, has a population of about 62,000. Vital statistics for the white population of New Zealand in 1943 show a birth rate of 19.7 per thousand, a low death rate of 10.0 per thousand, and the strikingly small infant mortality rate of 31.4 per thousand. The number of those in the armed services killed in the war up to May 31, 1945, was 9,844.

The people of New Zealand are largely of British origin, but another element in the population is made up by approximately 90,000 Maoris, Polynesians who migrated from the eastern Pacific several centuries ago. Their number, which at first decreased during white occupation, is again increasing.

Primary education in New Zealand is free and compulsory. The number of schools at all levels is large and the four colleges of the University of New Zealand had an attendance of 5,528 students in 1940. The census of 1936 showed religious affiliation as follows: Church of England, 40 per cent; Presbyterian, 23 per cent; Roman Catholic, 13 per cent, and the remainder scattered. New Zealand has an extensive social security system which began in 1898 with old age pensions and is therefore the oldest in the British Commonwealth.

The Economy. In spite of the rapid expansion of manufacturing in the country, New Zealand's economic system continues to rest upon the production of agricultural and animal products for export. Butter, cheese, meat, mutton and lamb, wool and skins bulk large among these commodities. The predominant position of Great Britain as a source of imports and a market for exports antedates by many years the wartime direction of trade in those channels.

ALZADA COMSTOCK.

NICARAGUA. A Central American republic. Area: 57,143 square miles. Population: 1,030,700 (1942). Capital: Managua.

Nicaragua's eastern and western lowland regions are separated by a highland area of from 5,000 to 7,000 feet elevation sloping gradually toward the southeast. The low coastal lands of the east have a wet tropical climate, while the northwestern lowland area has dry-winter climate. Temperate

to cool weather is found in the highland regions, varying according to altitude.

Government. Under the Constitution of 1939, Nicaragua has a bi-cameral Congress: a Senate of 15 members and a Chamber of Deputies of 40. There is a Cabinet of 7 members. All former presidents who were elected directly may sit as members of the Senate. The present Congress was formed by the division into two chambers of the Constituent Assembly elected in 1938, and it is to serve until Apr. 15, 1947. Anastasio Somoza became President in 1937 for a 4-year term which was extended in 1939 for 8 years as the result of adoption of the new Constitution.

The People. Sixty-eight per cent of the total population of Nicaragua are mestizos; 17 per cent are of European descent; 10 per cent are Negroes, and 5 per cent Indians. Highest regional density of population is in the western lowlands. The chief cities are: Managua, 87,620; León, 31,799; and Granada, 25,530 (1941 est.). The largest foreign colony is Chinese.

Spanish is the official language of the country. Roman Catholicism is the predominant religion.

About 30 per cent of the total population are estimated to be literate. In 1941 there were 648 primary schools with a total enrollment of 61,000. In 1938 there were 28 intermediate schools with a total registration of 1,181; and 413 students were enrolled in schools of higher education. There are 3 universities. Fifty-eight rural schools were opened in 1944 to provide instruction for over 3,000 children.

National Economy. Nicaragua's economy is agricultural. Coffee is the most important crop, with sesame seed ranking second. Sugar, rice, cotton, corn, beans, and bananas are also important crops. Livestock-raising is one of the principal occupations; there are an estimated 800,000 head of cattle in the country. Nicaragua also produces important forest products.

Gold and silver are practically the only minerals mined in Nicaragua. In 1944, gold production amounted to 219,579.1 troy ounces; silver, to 254,457.2 troy ounces.

There is little manufacturing. Small establishments make such articles as cigarettes, matches, beer, cement, leather shoes, furniture, and cotton textiles.

Foreign Trade. The value of Nicaragua's foreign trade in 1944 was estimated at \$25,000,000, of which imports constituted \$10,000,000 and exports \$15,000,000. In that year gold exports were \$7,700,000; coffee, \$3,700,000; rubber, \$1,000,000; lumber, \$675,000; sesame seed, \$466,000; and sugar, \$325,000. The United States was the principal market, receiving about 90 per cent of total exports. Panama ranked second as an export market, Costa Rica third, Mexico fourth, and Peru fifth.

Leading imports in 1944 were estimated at: textiles, \$2,000,000; machinery and vehicles, \$1,800,000; chemicals, \$1,500,000; foodstuffs, \$1,200,000; petroleum, \$1,100,000; iron and steel products, \$800,000; and paper products, \$350,000. The United States was the chief source of Nicaraguan imports, supplying 76 per cent of the total. Mexico ranked second, followed by Panama, Costa Rica, and Peru, in that order.

Events. There was an unusual amount of political activity in Nicaragua during 1945. It was the year before a presidential election, and recent upsets in other Central American countries seemed to have influenced President Anastasio Somoza.

At the beginning of the year Somoza told a correspondent that he would "throw away fifty

million presidencies for peace in Nicaragua." And during the summer he said that all persons who believed they were qualified would be allowed to run for president in 1946.

But late in July *La Noticia* of Managua reported Somoza had announced that he himself would again be a candidate since he "was not able to oppose the wish of the people." He said that he had hoped to postpone political activity until the following year, but "before the desire of the citizens that he launch his candidacy he had no course but to obey."

The editor of *La Noticia* was of the same political faith as Somoza, but he published an editorial denying the President's assertions, regretting that political serenity would now be destroyed, and noting that the fight was starting for the "alternation in power which was the legitimate aspiration of a majority of the Nicaraguan people."

Later, the President declared he would withdraw his candidacy "when all political tendencies unite on one man who has prestige with the people and is capable of carrying out the work of progress realized by my administration."

On Aug. 6 the Senate repealed a decree, issued in 1934, which prohibited electoral campaigns until ten months before the date of election.

There were many rumors of unrest in Nicaragua during the second half of the year. In September the authorities denied an unconfirmed report that four labor leaders had been shot to death while being escorted to the Honduran frontier for exile. It was asserted that the men were not labor leaders but "avowed bolsheviks at the service of a European government."

An official communique issued on October 22 denied reports that police had broken up a demonstration against Somoza, and added that the "greatest calm reigns throughout the entire country." But two days later 15 Nicaraguan refugees asked permission to enter Guatemala after the Salvadoran Government had refused them entry.

There were more rumors of trouble, and another official denial early in November. Then, on Nov. 22, seven political refugees, including a former Supreme Court Justice and a one-time Minister of Public Works, arrived in Panama after fleeing as a result of their participation in a demonstration against Somoza when Chilean President Juan Antonio Rios arrived at the Managua airport on Nov. 9. Leaders of the demonstration were said to include Liberal and Conservative party heads. Eye-witnesses declared that many had been injured when National Guardsmen used rifle butts and bayonets to break up the demonstration after the crowd had ignored orders to disperse. The Government admitted "political disorders," but said no one had been injured and only leaders of the movement were arrested.

On Dec. 7, more than 800 National Guardsmen held a banquet in honor of the President Somoza declared that the Guard would be loyal, "with me at its head," to the citizen chosen by the majority for President.

Somoza declared in his Christmas message that his Government was "dedicated to the moral and economic reconstruction of the country."

President Somoza told the opening session of the 46th Congress on Apr. 15 that the previous year's budget of \$11,000,000 had shown a surplus of \$1,600,000 which permitted the construction of 58 rural schools, a new university building in Leon City, a post-office building in Managua, public health buildings in several towns, and a considerable extension of roads. He added that fiscal

charges and freight rates on coffee exports had been reduced, and that Nicaragua's contribution to the United Nations' victory consisted of a continuous increase in agricultural production.

For the first time in history, organized labor celebrated May Day in Nicaragua. Thousands of workers, carrying United Nations flags, marched through the streets of Managua; the President and his entire Cabinet viewed the parade. (It was reported that Nicaragua had 125 unions with 3,899 members.)

A serious shortage of sugar was reported in February. Sugar rationing was established during the summer, and the Finance Ministry was trying to buy sugar in Peru or the Dominican Republic. The shortage was alleviated on Nov. 7, when 10,000 bags of Peruvian sugar arrived.

Several steps were taken against Axis nationals during the year. In July an executive decree authorized the issue of \$400,000 in defense bonds. The proceeds were to be used for a public works program and the bonds would be guaranteed by "frozen" Axis funds. Later in the summer the German firm Ernesto Sierke was sold at public auction, as the Government continued its program of gradually selling all Axis properties on the Proclaimed List.

On July 6 Nicaragua became the first nation to ratify the United Nations Charter.

Martial law was lifted on Aug. 16 and at the end of November the constitutional guarantees which were suspended during the year were reestablished; emergency economic measures were continued.

In his April address to Congress, Somoza declared that Nicaragua had become the second rubber producer on the American continent; and five months later, United States Ambassador Fletcher Warren said that the Rubber Development Corporation had contracted with the National Bank of Nicaragua to buy all rubber offered until June 30, 1947.

HARRY B. MURKLAND.

NICKEL. Canadian nickel production, approximately 247,000,000 lb., again constituted nearly the entire world output in 1945 (1944 Canadian production: 275,000,000 lb.). Nearly all came from the mines of International Nickel Co. of Canada, Ltd., in the Sudbury district of Ontario, with small amounts from neighboring mines. Other producing countries were Russia, which acquired mines at Petsamo, Finland, New Caledonia, whose production waned; Sweden; and Cuba, where mines were operated by the Freeport Sulphur Company. In the six years following 1939, about 1,500,000,000 lb. was delivered to the United States and its Allies by the Canadian mines.

Nickel, because of its use in alloys resistant to corrosion and high temperature, played an important part in the development of airplane superchargers, jet propulsion engines, rockets, and ordnance manufacture. Although peacetime demand is expected to drop, stainless and other alloy steel, plating, and other metallurgical uses should continue to require about 250,000,000 lb. a year.

Controls on the use of nickel and nickel alloys were removed by the United States and Canadian Governments late in August. In addition to large stocks in the hands of producers, the United States Government held, through the Reconstruction Finance Corporation, 36,620,421 lb. as of Oct. 31.

CHARLES T. POST.

NOBEL PRIZES. In the most diverse distribution of awards since the beginning of the war, Nobel

Prizes were presented to six European scientists, a United States statesman, a Chilean poet and the International Red Cross.

The 1945 Nobel Prize for physiology and medicine was given to Sir Alexander Fleming of the University of London, discoverer of penicillin, together with two of his coworkers in penicillin research, Dr. Ernst Boris Chain and Sir Howard Walter Florey, both of Oxford.

Dr. Chain, a German political refugee, left Berlin in 1933 to join Sir Frederick Gowland Hopkins, another Nobel Prize scientist, in Cambridge to do research on enzymes and the isolation of biologically active substances. In 1938 he began collaborating with Sir Howard on a systematic investigation of anti-bacterial substances produced by bacteria and molds. This research helped to produce the foundation for the discovery of penicillin.

The award was given for the discovery of penicillin and its healing effects in treating infections. The \$30,000 prize, shared equally by the recipients, was awarded by the Karolinska Institute of Stockholm, the medical college designated in the Nobel will to name the winners in physiology and medicine.

Prof. Otto Hahn of Berlin and Prof. Wolfgang Pauli of Zurich, Switzerland, and Princeton, New Jersey, received Nobel Prizes for their research in atomic fission.

Prof. Hahn, former head of the Kaiser Wilhelm Institute in Berlin and believed to be in the United States, received the 1944 prize for chemistry from the Swedish Academy of Science.

The \$30,000 award for physics achievement in 1945 went to Prof. Pauli for his development of the "Pauli exclusion principle" used in atomic studies.

Prof. Artturi Virtanen of Helsinki, Finland, was given the 1945 chemistry award for his discoveries on a method of conservation of fodder.

The Nobel Peace Prize for 1945 was presented to Cordell Hull, former U.S. Secretary of State, for his peace efforts and his work in constructing the United Nations Organization.

Senora Gabriela Mistral, Chilean poet, teacher and diplomat, received the \$30,000 literature prize for her poetry and prose. She was the first South American author to win this honor.

The 1944 Peace Prize was awarded to the International Red Cross for its war work.

NORTH AMERICA. Excluding Mexico and Central America, but including Greenland, Newfoundland, and smaller adjacent islands, the continent has an area of about 7,591,498 square miles (19,662,000 square kilometers) and a population estimated at 143,178,000 on Jan. 1, 1940. The combined area of Mexico, Central America, and the West Indian islands was about 1,073,080 square miles and the population about 40,870,000.

NORWAY. A European kingdom occupying the western and northern part of the Scandinavian peninsula. Capital, Oslo. King, Haakon VII, who was born in 1872 and was elected to the throne by the Storting (parliament) Nov. 18, 1905. Norway holds sovereignty over Svalbard (Spitsbergen and adjacent islands) in the Arctic Sea, 240 miles distant from the Norwegian coast (see **SVALBARD**); Norway also asserts sovereignty over uninhabited Jan Mayen Island in the Arctic Sea, and certain uninhabited areas in the Antarctic.

Area and Population. Covering an area of 124,556 square miles (land area, 119,148 square miles), Norway proper had 2,952,000 inhabitants on Jan.

1, 1941, by official estimate; by latest census, 2,814,194 in 1930. Only 28 per cent of the population of 1930 were classed as urban, and females exceeded males by about 71,000. The birth rate, per 1,000, was 16.3 for 1940 (15.9 for 1939); death rate, 10.7 (10.2). Populations of chief cities: Oslo, 288,606 in 1943; Bergen, 106,500 in 1938; Trondheim, 54,458 in 1930; Stavanger, 46,780 in 1930.

Government. Under the Constitution of 1814, as subsequently amended, executive power is vested in the King, acting through a Cabinet responsible to the Storting. The Storting consists of 150 members elected for four years by universal suffrage. It divides itself into two sections of 38 and 112, called the Lagting and Odelsting, respectively. In the last pre-invasion Storting, elected in October, 1936, the standing of parties was: Labor, 70; Conservatives 36; Liberals, 23; Agrarians, 18; others, 3. For the present composition of the Storting, see **EVENTS**, below.

Norway was invaded by German armed forces on April 9, 1940, and remained almost wholly occupied until May 8, 1945. For the German administration of Norway during that period and the puppet regime of Vidkun Quisling, see **YEAR BOOK** for 1944, p. 452.

Production. In normal times 29 per cent of the workers followed agriculture or forestry, 27 industry, 10 commerce, 9 transportation, 7 fishing and whaling, 5 professions and public administration. Under German rule, all economic resources and productive facilities were coordinated as far as possible with the requirements of the Nazi war machine. Production of the chief crops in 1940, with 1939 figures in parentheses, was (in metric tons): wheat, 70,700 (77,800); barley, 91,400 (103,500), rye, 5,700 (6,200); oats, 161,200 (200,800); potatoes, 1,250,000 in 1942. The fish catch for 1940 was reported at 1,070,000 metric tons (1,030,000 in 1939). The estimated livestock population in 1943, with prewar figures in parentheses, was: milch cows, 800,000 (860,000); young cattle, 400,000 (550,000); swine, 200,000 (360,000); poultry, 1,000,000 (3,250,000). The value of ore production in 1939 was 56,500,000 kroner, with pyrites and iron ore accounting for 81 per cent of the total. Estimated mineral and metallurgical production in 1940 was (in metric tons): iron ore, 1,500,000; pig iron, 175,000; tungsten, 20; nickel, 1,250; copper, 20,000; zinc, 5,000; lead, 320; aluminum, 15,000; molybdenum, 600. The merchant fleet's earnings in 1939 were estimated at about 800,000,000 kroner. Manufacturing is confined chiefly to the processing of wood, fish, minerals, and other Norwegian products.

Foreign Trade. Imports in 1944 were estimated at 721,000,000 crowns, exports at 517,000,000 crowns. Practically all trade during that year was with Germany and countries controlled by her, or with Sweden.

Events, 1945. To the Norwegians, the first four months of 1945 merely epitomized the long ordeal they had gone through in the preceding five years. Nothing of great importance happened. Except for a small strip of barren land in the far northeastern corner of the country, liberation still was only a hope and a promise. The present was desperate Quisling rule, Gestapo terror, and near-starvation.

The liberating Red Army and Norwegian forces in Finnmark were stalled by impassable terrain, winter conditions, and systematic devastations by the slowly retreating Germans. Only a few thousand square miles of Arctic wasteland were re-

taken. The rest of the country anxiously set its hopes on a seaborne invasion from the west that never materialized. Right up to the dramatic finale of the war in Europe, it looked as though the Germans would make good their threat of a prolonged last-ditch stand in "Mountain Fortress Norway."

As in Denmark, the high tension and suspense felt by both sides at the approach of Germany's final defeat led to numerous incidents between "joessings" (patriots) and Nazis. The most serious of these occurred on Feb. 8, when the head of Quisling's Norwegian Gestapo, Karl Marthinsen, was assassinated in Oslo. The enraged Nazis avenged Marthinsen's death with the execution of 34 prominent Norwegian hostages.

Liberation. With the dramatic culmination of military events in Germany, in the last days of April, tension in Norway rose to a feverish pitch. Open rebellion was impossible in the face of a German army of occupation numbering almost 450,000 and commanded by a diehard Nazi, General Franz Boehme, but harrassing operations of the patriotic underground became bolder by the day.

Following the official announcement of Hitler's death, General Boehme on May 1 proclaimed his allegiance to Doenitz and declared that the Germans would fight for Norway to the last. Indeed, when three days later the mass surrender of German forces in Holland, Denmark, and northwestern Germany was announced, there was no mention of Norway. It was not until the formal capitulation of all German forces on all fronts that Norway regained her freedom.

On May 7, the Norwegian Home Army came out into the open, seizing strategic positions and public buildings throughout the country. The Wehrmacht offered no resistance but sporadic fights with Quisling forces occurred. A few hours later, the broadcast announcement of Germany's capitulation sent festive crowds surging into the streets while church bells tolled in every town and village.

The formal instrument of surrender of all German troops in Norway was signed by General Boehme on the evening of May 8, at Lillehammer, where he had his headquarters. At the same time, the systematic roundup of Norwegian traitors and collaborationists got under way.

One of the very first to be taken by the Home Front forces was Vidkun Quisling himself; eight of his Cabinet members also were apprehended. The most hated of Quisling ministers, Jonas Lie, dared not face arrest and committed suicide, along with the Chief of Police Henrik Rogstad. This was also the way out sought by the German Reichskommissar Josef Terboven and his Gestapo Chief Wilhelm Rediess: the pair blew themselves up with one ton of dynamite in Terboven's private air raid shelter under the Crown Prince's castle at Skaugum.

Return of the Government. First to arrive in the liberated homeland were Crown Prince Olav, commander-in-chief of all Norwegian armed forces, and three Cabinet members, who were landed at Oslo from a British cruiser on the afternoon of May 13. The party was given a triumphal welcome by the Home Front authorities. Equally festive was the homecoming of Premier Johan Nygaardsvold, with the rest of the government, on May 31. Throughout its five years abroad, the Nygaardsvold Cabinet had stood out among exiled regimes not only for its exceptional stability but also because its legality and composition were never questioned by the underground forces at home.

King Haakon was the last of the top Govern-

ment leaders to return. By agreement with his Cabinet, he picked for his homecoming the same day on which, in 1940, he and his Government had been forced to leave Norway: June 7. This was also the fortieth anniversary of Norway's declaration of independence.

A huge crowd, waiting patiently in the rain, gave King Haakon a rousing welcome as he arrived in his beflagged capital at noon. In five years of war and exile, the Norwegian monarch had achieved a distinction and popularity undreamt of before 1940.

Political Changes After Liberation. Premier Nygaardsvold's Cabinet, which in its London exile had gone through no serious crisis, resigned on June 12 to open the way for larger participation in government of the former underground.

In accordance with this purpose, the King asked the revered leader of the Home Front, Chief Justice Paal Berg, to form a new Cabinet, but the latter, a Conservative, declined in view of the country's predominantly leftist sentiment. Haakon then called upon Einar Gerhardsen, youthful leader of the Labor Party. Mr. Gerhardsen on June 22 presented to the King a coalition Cabinet of all five major parties, including, for the first time, the Communists. With the exception of Foreign Minister Trygve Lie and Defense Minister Oscar Torp, the only two holdovers from the Nygaardsvold Government, all fifteen Cabinet members had been selected from the ranks of the resistance movement. The King approved the list and appointed Gerhardsen Premier.

On Oct. 8, the first parliamentary elections in nine years were held in an atmosphere of complete calm and order. As had been generally expected, the poll marked a decisive swing to the left. The Labor Party, gaining 76 seats, won an absolute majority in the 150-man Storting; it obtained 542,508 votes—an all-time record in Norway. The Communists, who had merged with the Labor Party in July, but later had split from it again, obtained 146,423 votes and 11 seats.

The Conservative Party came out second, with 211,767 votes and 25 seats; the Agrarians obtained 117,885 votes and 10 seats; the Liberals won 184,367 votes and 20 seats. A hitherto unimportant group, the Christian People's Party, gained 104,819 votes and 8 seats in the Storting.

As a result of the Labor Party's victory, Premier Gerhardsen on Nov. 1 resigned with his coalition Cabinet and immediately formed a Laborite Government, approved by the King. Mr. Lie was retained as Foreign Minister, but Mr. Torp, who also stayed in the Cabinet, was given the Ministry of Supplies. Three more ministers were continued in office: Lars Evensen, Commerce; Sven Oftedal, Social Affairs; Kaare Fostervoll, Education. Principal newcomers were: Finance Minister Erik Brofoss; Minister of Justice Oscar Gundersen; Minister of Agriculture Kristian Fjeld; Minister of Labor Nils Langhelle; and Defence Minister Jens Hauge.

Quisling's Trial and End. Meanwhile, the purge of Nazis and traitors had been gathering momentum. A total of about 21,000 persons were arrested in the months following liberation, on various charges of collaboration with the Germans; of these, 4,269 were released again.

The death penalty, abolished 70 years ago, was restored by an act of Parliament on June 29. It was applied for the first time on Aug. 17, when a Norwegian Gestapo man, Reidar Haaland, was executed.

Vidkun Quisling went on trial on Aug. 20. The indictment, presented by Special Prosecutor An-

naeus Schjoedt, charged the Norwegian Nazi leader with a variety of crimes, ranging from high treason to petty larceny. The gravest charges were that he had not only collaborated in the Nazi invasion of April, 1940, but had actually originated the idea in order to usurp power; that he was responsible for the murder of two prominent Norwegian patriots, Viggo Hansteen and Gunnar Eilifsen, by the Germans; and that he was a deserter in wartime since he did not report for duty, although he was a pensioned officer in the reserve. The prosecution, demanding the death penalty on various counts, drew heavily on captured German documents to prove its charges. Quisling in vain sought to deny or justify the actions imputed to him. On Sept. 10 the court found him guilty of all major charges and he was sentenced to death by Justice Erik Solem.

The doomed traitor filed an appeal to the Supreme Court which was rejected on Oct. 13. Although Quisling himself did not seek a pardon from the King, his wife Maria did. A few hours after this request had been rejected by the King, Quisling was executed by a firing squad on the early morning of Oct. 24.

The Road Back. Norway recovered more rapidly and evenly from its five years of Nazi occupation and Quisling rule than most other German-occupied countries. In the absence of any disturbances, or even of any signs of possible future trouble, all foreign troops had been withdrawn by the end of the year.

The last Soviet troops were evacuated from East-Finnmark on Sept. 25, exactly eleven months after they arrived as liberators of that province. The American task force of 4,700 men was withdrawn in mid-October, after German defenses had been dismantled. The British left in November, except for a small contingent handling the last few thousand German prisoners to be sent home.

Norway's food and supply situation improved steadily from month to month. The specter of mass starvation, which loomed menacingly just before liberation, was quickly dispelled by supplies speeded from America, Denmark, and Sweden. Bread, butter, meat and fats were in comparatively ample supply toward the year's end. The coal shortage remained acute as everywhere in Europe, but imports of gasoline and oil reached almost prewar level.

On the whole, the outlook for Norway was favorable and economists predicted a complete recovery within a few years.

JOACHIM JOESTEN.

OPINION RESEARCH CENTER, National. An institution established in 1941 by the Field Foundation, Inc., of New York City, in association with the University of Denver, as the first non-profit, non-commercial organization in the United States devoted to ascertaining public opinion. During 1945 the Center's research was concentrated largely upon securing attitudes in the United States toward: (1) a world organization, (2) the control of the atomic bomb, (3) the post-war treatment of Germany and Japan and other peace problems, and (4) the responsibilities of government, business, and labor in solving the economic problems of reconversion and the postwar period. Detailed reports covering public opinion in these areas were published by the Center.

A special study undertaken in 1945 reported popular attitudes on the issue of the control of prices, wages, and salaries during the war and the period of reconversion. Another special report,

based on a survey made for the American Library Association and 17 cooperating city libraries, analyzed public information about and use of various services offered by public libraries. Other special reports and reprints by NORC staff members and associates concern such subjects as the validity of opinion polls, the accuracy of public opinion on international issues, and certain ethnic aspects of white attitudes toward Negroes.

Part of the Center's activities are devoted to discovering, testing, and perfecting new techniques, methods, and devices for ascertaining the status of public opinion. In this connection the Center serves as an organization available to research workers in academic fields for the study of such problems as interviewing techniques, analysis of data, and the interpretation of survey results.

Another purpose of the Center is to analyze and review the results of surveys made by other polling organizations. This function is fulfilled in the publication by NORC of *Opinion News*. Designed for the use of business men, government officials, educators, librarians, and others who must follow closely the trends of public opinion, *Opinion News* summarizes the findings of all the leading polling and public opinion surveying organizations, both in the United States and abroad. This fortnightly covers public thinking on current political questions, the progress of world organization and peace plans, reconversion on the domestic front, rehabilitation of liberated areas, and administration of the Axis nations.

The Center has published, on the basis of the popular vote for President in 1944, a series of ten distorted maps, each covering some important political aspect of the voting and distribution of votes by states. NORC has also published a distorted map of the world, "Distribution of World Population," in which each country is drawn in proportion to its population instead of its land area.

The National Opinion Research Center has made surveys or worked in cooperation with a number of other nonprofit organizations, including six agencies and departments of the U.S. Government. The Director is Harry H. Field. Offices: 280 Madison Ave., New York City.

PACIFIC WAR COUNCIL. A Council, announced by the President on Mar. 30, 1942, which considered matters of policy relating to the joint war effort. Meetings were held at the White House. A diplomatic representative of each of the following nations attended meetings of the Council: United States, Great Britain, China, The Netherlands, Australia, Canada, New Zealand, and the Commonwealth of the Philippines.

PALAU ISLANDS. A group of islands (143° 10' E. and 6° 50' N.) in the western Carolines of the Japanese Pacific Islands: The chief islands of the group are Palau proper, or Babeldaob (143 sq. mi.), Angaur (3 sq. mi.), and Koror (3 sq. mi.). Total area, 184 square miles. Civil population (1938), 12,798. Angaur supplied 20 percent of Japan's phosphate needs—the total deposits of the island being estimated at 2,400,000 tons. The laterite deposits contain a large amount of bauxite. There are many good anchorages for ships and a large harbor at Malakai. During September, 1944, United States armed forces captured the islands of Palau and Angaur. After the defeat of Japan all the islands passed under Allied control.

PALESTINE. A part of the former Turkish province of Syria, governed by Great Britain as Mandatory

Power since Sept. 29, 1923. Area, 10,429 square miles. Capital, Jerusalem.

Government. Palestine is a Class A Mandate administered by a British High Commissioner, who is assisted by various officials—British, Jewish, and Arab. The country has been divided into six districts, each under a district commissioner.

In governing Palestine the British have found it advisable to give considerable autonomy in certain matters to the Moslem, Jewish, and Christian communities. The religious affairs of the Moslems are controlled by the Moslem Supreme Council, and questions involving their personal status are under the jurisdiction of the Sharia courts. The Jewish community is organized under an elected assembly and a general council (*Va'ad Leumi*). The community operates its own schools and has courts with jurisdiction over certain matters of personal status. Much the same situation exists for the several Christian communities.

There is also a Jewish Agency, a quasi-governmental body, composed of both Zionists and non-Zionists, which concerns itself with the establishment of the Jewish National Home, promised in the Balfour Declaration of Nov. 2, 1917. Finally, there is a regular hierarchy of courts instituted by the Mandatory Power to sit in criminal cases and in such civil suits as do not come before the religious tribunals. The police force is composed of British, Arab, and Jewish elements. The official languages are English, Arabic, and Hebrew.

Events, 1945. Political conditions in Palestine continued to deteriorate during the year. On Jan. 3 Sir Edward Grigg, who had succeeded Lord Moyne as British Minister of State in the Middle East, told the Jews that they must eliminate gangsterism or the Christian world would come to oppose Zionism. On Jan. 10 the two Jewish youths accused of having murdered Lord Moyne confessed before the military tribunal in Cairo that they had been sent by their political organization in Palestine to commit the crime. After a trial they were sentenced to death and hanged on March 22 (see EGYPT).

In anticipation of an Allied victory over Germany, the Jewish Agency had already begun laying plans for bringing more than a million Jews from Europe into Palestine, according to a statement of its chairman, David Ben Gurion, on Dec. 29, 1944. He described the White Paper as a "relic." Statements of this sort only solidified Arab resistance and undoubtedly helped to make possible the creation of the Arab League in Cairo during the conferences of February and March (see PAN ARAB AFFAIRS).

Though Palestine was technically not admissible to the League, as it was not an independent state, it was nevertheless allowed to send a representative and to have a vote on the Council. The delegate did not, however, sign the Pact of Cairo on Mar. 22.

The problem of how to govern Jerusalem with its discordant racial and religious elements became acute during the spring. On Mar. 21, Lord Gort, the High Commissioner, proposed that the mayoralty of the city be rotated among the Moslem, Jewish, and Christian communities. The Arabs opposed this idea. In April it was proposed that Jerusalem be divided into Jewish and Arab parts, each with its own municipal officials. This did not prove to be feasible. Finally on July 11 it was announced that the Holy City was to be ruled by a five-man commission. It was now the Jewish turn to protest.

On Apr. 27 the Palestine Government announced the imposition of higher taxes on corporations and a new war profits levy. The financial year, which closed on Mar. 31, showed a deficit of around

£P3,500,000 despite a rise of £P2,500,000 in tax receipts. One of the principal drains on the treasury was the £P5,000,000 spent on subsidies for cereals, flour, and meat. The citrus industry also required help since several years would pass before it could recover from its wartime slump. The continued inflation obliged the Government to enforce price controls and to fight the black market. At the time this report was issued, the price index was 258 (100 being the prewar level).

Both Zionist and Arab organizations presented their cases at the San Francisco Conference. The Arabs had the advantage of being officially represented through five independent states. However, the Conference ruled that the Palestine problem was not one for its consideration.

On May 24 the Kirkuk-Haifa pipeline was blown up in two places—the first time that damage had been inflicted on this important artery since the beginning of the war. The Iraq Petroleum Company nevertheless went ahead with its plans to lay a new pipeline paralleling the old one and to expand its facilities at Haifa.

The thirty-seven American State Governors who met at Mackinac Island in early July joined in petitioning President Truman to raise the issue of opening Palestine to further Jewish colonization at the forthcoming Big Three meeting [at Potsdam]. The Zionists were meanwhile taking comfort from the sweeping Labor victory in the British elections. Laborites had upon various occasions made pro-Zionist declarations. At the World Zionist Congress which met in London early in August the open door for Jewish immigration into Palestine was vociferously demanded. An interesting straw in the wind at this time was an editorial in the London *Times* of Aug. 15 which described the issue in Palestine as "a conflict of two rights," and came out for partition as the most practicable solution, despite the fact that the Peel Commission had unsuccessfully proposed this drastic remedy in its report of 1937.

The tactics of both Arabs and Zionists included constant efforts to commit the American and British governments to action favorable to their side. For example, in a press conference on Aug. 16, President Truman called for the free and open settlement of Palestine and revealed that he had raised at Potsdam the question of the need for a Jewish National State in Palestine. This called forth from Abdul Rahman Azzam Bey, Secretary General of the Arab League, a rejoinder that President Roosevelt had promised Ibn Saud in February that he would not support the Jews in Palestine. After heated discussions throughout the Middle East and Anglo-Saxon world, Secretary of State Byrnes on Oct. 18 finally revealed the text of the correspondence exchanged between Ibn Saud and the late President. The Arab monarch's letter, dated Mar. 10, after giving a long recitation of Arab claims to Palestine, reminded the President of his verbal promise to assist the Arab cause. In his reply, dated Apr. 5, Mr. Roosevelt stated that his government had already made clear its "desire that no decision be taken with respect to the basic situation in that country [Palestine] without full consultation with both Arabs and Jews." Zionist denunciations were immediate and vociferous. The Arabs, to back up their case, on Oct. 20 published a joint memorandum from the governments of Egypt, Iraq, Lebanon, and Syria which had been handed to Secretary Byrnes on Oct. 12, and which warned that war would follow any attempt to set up a Jewish state in Palestine. Three days later the American Zionist Emergency Council presented a very force-

ful memorandum to Mr. Byrnes giving its side of the story.

Meanwhile Mr. Chaim Weizmann had on Sept. 24 revealed the Jewish Agency's refusal of Britain's offer to permit 1,500 Jewish immigrants a month to enter Palestine. By October the situation had reached a virtual stalemate which some of the more belligerent Jewish elements had obviously decided could be resolved only by violence. British troops poured into the country, while both the Arab and Jewish police were disarmed. In the north and east there was an increasing number of clashes between Jewish settlers and the Trans-Jordan Frontier Force. On Oct. 8 the Jews staged a five-hour general strike and organized large but orderly demonstrations as a protest against British policy. Two days later over 200 European Jews being held in a detention camp near Haifa were freed by force. At least two people were killed in this incident.

By Oct. 11 the situation had become so explosive that it was decided to evacuate American troops from Palestine as fast as possible. One of the complications which the American officers wished to avoid was the use of American arms by Jewish terrorists who had developed a technique for raiding Allied munitions depots. Oct. 26 marked the arrival at Haifa of 997 Jewish immigrants, the last to be admitted under the provisions of the White Paper of 1939.

By the end of October most of the Arab parties in Palestine except the largest (controlled by the Husseini family) had apparently agreed to revive the Arab Higher Committee, dissolved by the British before the war. Finally on Nov. 22 the Committee was reconstituted with twelve members said to represent some three-quarters of the Arabs in Palestine. This coalition had been brought about through the intervention of outside personalities connected with the Arab League, notably Jamil Mardam Bey from Syria. One-half of the newly formed Committee consisted of representatives from the important Husseini Party, which had until then been unwilling to cooperate.

Early in November the tempo of acts of violence committed by Jewish terrorists increased markedly. Railroads were blown up in many places, coast guard stations were attacked, bombs were set off in public buildings. The curfew was imposed over a large part of the country. More British troops were sent in and the Jews were warned that violence only jeopardized the achievement of their aspirations.

On Nov. 2 Lord Cort resigned as High Commissioner to be replaced by Lieutenant-General Sir Alan Cunningham. On the 13th Foreign Secretary Bevin made a long statement before the House of Commons in which he reminded his listeners that the Arabs had rights and that they should not be called upon to bear the full weight of the results of European persecution of the Jews. After this speech he told American correspondents that Palestine was scheduled to become a trustee state of the UNO and that it eventually would obtain self-government, but as a Palestinian, not as a Jewish, state. On the same day President Truman announced that the United States had accepted Britain's proposal for the appointment of a twelve-man joint commission to sift the facts concerning Palestine and to make recommendations. The American chairman of this commission was Judge Joseph C. Hutcheson of Houston, and his British colleague was Sir John E. Singleton. On Dec. 11 the Arabs in Palestine declared that they would not cooperate with the commission.

The Foreign Relations Committee of the U. S.

Senate on Dec. 12 voted 17 to 1 in favor of a resolution calling on its government to use its good offices with Great Britain to reopen Palestine to Jewish immigration. On the 17th the Senate passed this resolution by an overwhelming vote, and two days later the House of Representatives approved it by 133 to 36.

The Bevin statement merely inspired the Zionist extremists to more acts of violence. A climax came when on Dec. 27 terrorists blew up a police building in the middle of Jerusalem. As a result of this and other outrages at least ten persons were killed. Some 1,500 Jews, including prominent citizens, were rounded up for identification and questioning in Jerusalem alone. By the end of the year British troops were conducting wholesale manhunts and the Holy Land seemed to be rapidly falling into a state of open insurrection.

The People. The number of inhabitants in Palestine can only be estimated. There were probably more than 1,800,000 at the end of 1945, divided approximately as follows: Moslems, 1,100,000; Jews, 600,000; Christians, 140,000. During the last twenty-five years the population of Palestine has increased 300 percent due to the large-scale immigration by both Jews and Arabs and to the high birth rate of the latter. The Moslems and most of the Christians are Arabs and speak Arabic as their native tongue. Hebrew is widely used among the Jews, though many of those who migrate to Palestine from Europe have to learn it as an entirely new language. The adaptability of the ancient Hebrew tongue to modern uses has been one of the interesting by-products of Zionist colonization.

There are still many nomads or semi-nomads, chiefly in the south. Due to the tremendous urban development of recent years, nearly half the population now lives in towns or cities. The larger cities, with their estimated populations, are: Tel Aviv, 175,000; Jerusalem, 160,000; Haifa, 125,000; Jaffa, 100,000. Tel Aviv is an all-Jewish city, while half or more of the inhabitants of Haifa and Jerusalem are Jewish.

In 1942-3 the Government operated 503 schools for the Arabs. Education for Moslem girls is making rapid strides. There were also 161 private Moslem schools. In the Hebrew educational system there were 488 schools, including a number of secondary and technical institutions. Jewish private schools numbered 297. The Christian communities operated 181 schools. On Mount Scopus near Jerusalem is the Hebrew University, which is one of the foremost centers of higher learning in the Near East.

The Economy. Most of Palestine presents a picture of barren hills and treeless steppes. The succession of peoples who have lived in the country since the beginning of historic time have denuded its once extensive resources of soil and forest. Today this process is gradually being reversed. The influx of Jewish colonists and capital has led to a remarkable agricultural and industrial revival, in which the Arab population has also widely shared. The results of Jewish settlement on the land are especially noticeable on the maritime plain, the Emek (or the valley of Esdraelon) and in the northern Jordan valley. Some 410,000 acres were in Jewish possession in 1943. Further acquisitions were virtually prohibited by the White Paper of 1939.

The volume of the country's agricultural production is shown by the following figures: 13,000,000 cases of oranges and 2,000,000 cases of grapefruit were exported in 1938-9 (exports dropped during the war but are picking up again); milk production in 1943, 120,000,000 litres; average output of olive

oil, 7,000 tons. Other crops for 1943 were: wheat, 63,895 tons; barley, 56,025 tons; fresh non-citrus fruit, 280,053 tons; vegetables, 213,767 tons. In the same year there were 242,945 cattle, 244,062 sheep, 325,376 goats, 29,736 camels and 107,736 donkeys. Many other products could be mentioned by way of illustrating the considerable diversification attained by the country's agricultural and pastoral economy. Reforestation has also been undertaken on a small scale.

The manufacture of many small items has increased greatly, due to the immigration of skilled workmen and artisans from Europe (for statistics see YEAR BOOK for 1944, p. 457). There are extensive oil refineries in Haifa at the western terminus of the pipeline from Iraq. The vast mineral resources of the Dead Sea are exploited by the Palestine Potash Company.

In 1938 imports (principally foodstuffs, textiles and machinery) were valued at £P11,356,963 and exports were £P5,020,368. Haifa has the only modern harbor in Palestine. At Jaffa and Tel Aviv vessels of any size must anchor out and be serviced by lighters. The railway mileage is 334 kilometers of standard gauge and 112 kilometers of narrow gauge. The completion of the line from Haifa through Beirut to Tripoli during the war put Palestine into direct rail communication with Istanbul. The road system of Palestine has been greatly improved and extended under British administration.

ROBERT GALE WOOLBERT.

PALMYRA ISLAND. An atoll in the Central Pacific, belonging to the United States. Lying 1,109 air miles southwest of Honolulu and 1,513 miles northeast of Pago Pago in American Samoa, it is an important station on the Hawaii-Samoa air route. Land area, 1½ square miles. Population (1940 census), 32. The U.S. Navy Dept., which has jurisdiction over the island, converted it into a naval air station.

PANAMA. A republic of Central America. Area: 28,575 square miles, excluding the Canal Zone of 553 square miles. Population: 631,637 (1940). Capital: Panama.

Most of the surface of Panama is covered by low mountains and hills; a gap between the mountain ranges provides the lowland through which the Canal passes. The climate is mostly hot and humid, but on the Pacific side of the mountains it is drier and more healthful. The mean annual temperature is 80 degrees.

Government. Panama is a centralized republic of 7 provinces and 1 intendencia. The Constitution of 1940 provided for a uni-cameral National Assembly of 32 members, to meet annually for four months, beginning on Jan. 2. The President and members of the Assembly were elected directly and concurrently for 6-year terms. The president was aided by a Cabinet of 6 members. President Ricardo Adolfo de la Guardia dissolved the Assembly in December, 1944, and called elections for a Constituent Assembly, which convened in June, 1945, and selected Enrique A. Jiménez Provisional President.

The People. Fifty-eight percent of the total population of Panama is mestizo, 17 percent of European descent, 15 percent Negro, and 9 percent Indian. The largest concentration of population is in the vicinity of the Canal Zone and in the north-central region. The largest cities are: Panama, 111,893; Colón, 44,393; and David, 9,222. The small foreign population forms the dominant economic group.

Spanish is the official language. Roman Catholicism is the predominant religion.

According to the census of 1940, 64.7 percent of the population over 10 years of age (excluding Indians) is literate. In 1942 there were 74,039 students enrolled in 670 elementary schools; 8,407 students in 29 intermediate schools; and 857 in the University of Panama. During 1945 the Panamanian Government provided funds for 86 new schools.

National Economy. The economic life of the country is influenced to a large extent by the Panama Canal. Major economic activities are associated with the passage of goods through the Canal, and in recent years construction activities in the Canal Zone and provision of commercial services for military and civilian personnel have played an important part in the economy of the rest of Panama. Agriculture is the chief occupation. Bananas are the principal export crop, and cocoa and abacá are also raised for export. Rice, corn, coffee, sugar, tobacco, beans and fruits are grown for local use. Cattle raising, rubber production, and exploitation of forest products are also important.

Industrial development has been limited by the small size of the local market. Sugar and rice are processed, and shoes, soap, beverages, hats, furniture, and clothing are manufactured.

Foreign Trade. Exports during 1944 were valued at \$2,809,982, compared with \$1,934,123 in 1943; this reflected increased shipments of bananas and abacá. Total exports of bananas in 1944 amounted to 1,159,000 stems; of abacá, 6,000,000 pounds. Rubber exports to the United States in 1944 totaled 816,726 pounds. Cocoa exports decreased from 2,789 metric tons in 1943 to 1,455 metric tons in 1944.

Panama's imports for 1944 were valued at \$38,000,000, of which 66 percent originated in the United States. Manufactured goods and foodstuffs were the chief imports.

Events. The year opened in the midst of a political crisis in Panama. The Cabinet had resigned and a new one had been named on Dec. 31. The change was interpreted as a victory for President Adolfo de la Guardia, since it gave broader representation to the parties which supported him. He refused the demand of the Junta de Notables (a group of political leaders, lawyers and businessmen) that he resign and declared that he intended to remain in office until June 15 unless the administration parties demanded his removal. The censorship imposed on the newspaper, *Panama American*, was lifted and the National Youth Congress, which was calling for a general strike, was permitted to continue its sessions. It refused to commit itself on its future attitude, but agreed to negotiate with the Government. United States forces in the Canal Zone were confined to barracks.

On Jan. 4, 15 members and 3 alternates of the National Assembly who had fled the country, re-crossed the border secretly into Panama and elected Jephtha Brawner Duncan, 59-year-old educator and journalist, First Vice President of the republic. Duncan immediately challenged the right of de la Guardia to continue in office, charging that, in accordance with the suspended Constitution, he should succeed the Acting President on Feb. 15. Seventeen non-opposition assemblymen declared the acts of the rump Assembly were illegal and reasserted their support of de la Guardia. The unrest spread to Panama's third largest city, David, where the police fired overhead and used sticks to disperse an anti-de la Guardia demonstration.

On Jan. 5 the new "Coalition Cabinet Govern-

ment" of de la Guardia issued a statement that it was "taking all measures leading to the holding of a strictly pure election" for members of a constituent assembly and was maintaining at all times "tranquillity and order." It promised to continue close and cordial relations with the United States, to defend the Panama Canal and to fulfil loyally international pacts, especially "those related to the war effort of the United Nations." The crisis died down as seven out of the country's eight parties agreed to cooperate with the President, and elections were called for May.

The rump National Assembly continued to function for a little while in the Canal Zone. On Jan. 31 it elected Alfredo Alemán president of the assembly, and two weeks later (Feb. 15) it completed its organization by swearing in Duncan as Acting President of Panama, and naming a seven-man Cabinet. It issued a manifesto on Mar. 8 in which it reasserted its claim to be the one legal and authentic government of Panama. President de la Guardia declined "to dignify this action by any comment." By early March all but eight or nine of the refugee assemblymen had returned to Panama, apparently unmolested by the police. And on Mar. 9 the last two of the exiles flew to Costa Rica, ending even the semblance of a government-in-exile in the Canal Zone. On June 11 de la Guardia issued a decree granting amnesty to 29 persons charged with subversive activities against his administration. Later that month Duncan himself was back in Panama trying to organize a union of all liberal groups.

Heavy voting marked the special election for a Constituent Assembly on May 6. Women, who were voting for the first time, turned out in large numbers. The pro-Government coalition of six parties won 39 out of 51 seats. The opposition Renovation Party, however, won 12 seats, which was more than any one of the coalition parties secured.

The Constituent Assembly convened on June 15 to adopt a new constitution and to restore the nation to a legal basis after nearly four years under provisional regimes. De la Guardia resigned on the same day, and the assembly elected former Ambassador in the United States Enrique A. Jiménez Provisional President. Of a total of 51 votes, Jiménez received 30 and Roberto Chiari 12; the remaining nine were blank. The Assembly also elected Ernesto de la Guardia, Jr. and Paul Jiménez as First and Second Vice Presidents, respectively. The new Provisional President declared that he wanted to strengthen relations with the United States, invite foreign capital to Panama, and develop commerce and industry.

In Buenos Aires, meanwhile, exiled former President Arnulfo Arias charged that he was still Panama's constitutional President and would remain as such until his term expired in February, 1947. He was trying to return to Panama, Arias asserted, but the Panamanian consulate refused to give him a visa. A campaign to obtain permission from the Government for Arias's return was opened by a demonstration in Colón in August, and on Aug. 13 the Panamanian consulate in Buenos Aires was instructed to give him a passport. Arias left Argentina on Oct. 3 and arrived in Panama City Oct. 13. Addressing an elaborate welcoming demonstration of his followers, he declared that "the imperialistic sector of Washington is treating Panama like an inferior conquered nation" and that the Good-Neighbor policy has been turned into a "wolf in sheep's clothing." He indicated his intention to participate actively in politics by stating that he

had returned to Panama to "serve the people in any capacity they demand." The Republic of Panama was declared out of bounds for United States soldiers during Arias's arrival. This move was criticized locally as ill-advised and likely to have harmful repercussions among the people of Panama.

On Oct. 16 President Jiménez, in apparent answer to Arias, denounced as "unjustified" any sentiments of hostility in Panama toward the United States, and a week later he warned that the Government was prepared to repress severely any attempt to disturb public order. He added that political activity by Arias's followers had increased greatly. On Oct. 19, 41 of 51 members of the Constituent Assembly condemned "recent hostile acts and statements attacking the Good-Neighbor policy" made by former President Arnulfo Arias. The general secretary of the Assembly warned that democratic elements must be prepared to oppose the "strong weapons or organization . . . and terroristic tactics" of Arias.

Saber-wielding police broke up a meeting held on Oct. 25 by followers of Arias, during which the former President again asserted his claim to the presidency. Other speakers violently attacked the Constituent Assembly and demanded that dates be set for a presidential election and the term of office of the Provisional President. Four days later Arias was arrested on order of the Mayor of Panama City, on the charge that he had incited rebellion and insulted the police officer in charge of the detachment which broke up his meeting. Arias admitted that he had called the officer a traitor but denied that he had "abused him." Arias was released on bail Oct. 30.

On Oct. 29 a home-made bomb was thrown against the capital's principal jail. Another bomb was thrown Nov. 4, this one at a house owned by former President Augusto Boyd. Aides of Arias were arrested and the President declared that "terrorists will not achieve their aim of creating confusion in order to overthrow the present authorities." Panamanian political commentators thought that the terrorists were trying to drive United States authorities to forbid United States troops in the republic, thereby making their campaign easier.

Arias was detained for an hour on Nov. 26 on charges of assaulting a police lieutenant. Two weeks later the Government was reported holding incommunicado five men who had been trying to buy arms from United States soldiers. Two of them were described as Arias men.

On Dec. 21 Arias was again arrested on charges of instigating an abortive revolution in Colón. Twenty-five of his followers, including prominent businessmen and two of his brothers-in-law, were also seized. The revolt had taken the form of an armed midnight attack on the Colón police station and telephone exchange, in which at least 6 persons were killed and 12 wounded. Police called this the "most violent attempt against the Government in 15 years," and President Jiménez laid the responsibility for it on Arias's supporters, although he did not directly implicate the former President himself. Arias said: "I knew nothing about what happened in Colón until I read the morning papers. I am not involved in any subversive plan but only in a civic campaign to re-vindicate the Panamanian people and the republic." There were more arrests later, and the police announced that their investigations showed the plotters had planned simultaneous attacks, which failed to come off, in Colón and Panama City. Arias was still in custody as the year ended.

On Dec. 28 the Constituent Assembly passed a

record high 1946 budget of \$30,000,000, of which \$1,161,907 was allocated for foreign debt service, \$11,600,000 for internal administration, \$8,200,000 for public works, and \$5,140,000 for education.

Panama's first major labor dispute of recent years came on Dec. 10, when printers of the three leading capital dailies, *Estrella de Panama*, *La Nación*, and *Panama American*, struck after the failure of negotiations for a minimum wage. Members of the painters' and carpenters' unions staged sympathy walkouts. The papers resumed publication on Dec. 12, when the printers agreed to a truce.

There were no major developments in relations between Panama and the United States during the year. On May 17, water and sewage systems in Panama City, under United States ownership, were transferred to the Panamanian Government by executive order of President Truman. The United States Embassy issued a statement on July 8 that the 1942 rubber contract between Panama and the Rubber Development Corporation had been extended until June 30, 1947. The United States will be required to vacate defense sites in Panama by Sept. 1, 1946, Foreign Minister Ricardo J. Alfaro stated on Nov. 7 in an official interpretation of the agreement under which the sites were granted. It was revealed that 60 out of 83 United States defense installations in Panama had already been returned.

Panama severed diplomatic relations with the Franco Government of Spain on June 30. On Sept. 16, the general secretary of the Presidency declared that new relations with the exiled Spanish republican regime in Mexico constituted "renewal" rather than original recognition. Panama did not consider it necessary to make a formal recognition, but was merely resuming interrupted relations with the legal republican Government of Spain.

On Nov. 28 the Constituent Assembly approved unanimously a resolution requesting the Government to begin immediate inter-American consultations on the breaking of diplomatic relations with the Dominican Republic, Honduras and Nicaragua. This action followed presentation to the assembly of seven Nicaraguan political exiles.

HARRY B. MURKLAND.

PANAMA CANAL ZONE. A strip of land crossing the Isthmus of Panama and extending about five miles on each side of the canal between the towns of Cristobal on the Atlantic Ocean and Balboa on the Pacific Ocean. By treaty with the Republic of Panama in 1903 the United States leased the Canal Zone in perpetuity at an annual rental of \$250,000 (gold currency). In 1933 the United States went off the gold standard and since then the annuity has been fixed at \$430,000 payable in any currency. Area, 552.95 sq. mi., including 190.94 sq. mi. of water. Balboa Heights is the administrative center.

Population. The 1940 U.S. census reported 51,827 persons, both civilian and military, in the Canal Zone. Of this number less than one-half were whites from the United States. The remainder were mostly Negroes who were born or had parents who were born in the English-speaking West Indies. This accounts for the wide-spread use of English in the Canal Zone. Illiteracy was low in the white civilian population but higher among the Negroes, 16.8 per cent in 1930. Public schools for both whites and Negroes are supported by Congressional appropriations.

Panama Canal Finances. For the fiscal year ended June 30, 1944, there was a net deficit from tolls and other sources of \$5,367,631. The net capital

investment in the Canal, after depreciation, as of June 30, 1944, was \$655,795,477, including \$128,991,063 interest on funds borrowed to construct the Canal up to the formal opening on July 12, 1920.

Economic Conditions. The Panama Canal Zone is a U.S. military reservation whose principal industry during peacetime is the maintenance and operation of the Panama Canal. Only employees of the United States may live in the Canal Zone and all employment is restricted to government ventures. Recent data on shipping traffic, financial operations, and commerce were withheld for military reasons. See YEAR BOOK for 1943, p. 521.

Government. A civil government was authorized by Congress by the Panama Canal Act of 1912 and general supervision delegated to the Secretary of War. Administration rests, normally, in the hands of a Governor appointed by the President for a period of four years, but in wartime it is under the authority of the commanding general of the Panama Canal Department, U.S.A. Subject to such superior authority the scope of government goes much beyond the functions of government in the other territories. The Governor's duties can be compared to those of an executive in the efficient management of a vast business organization. An Executive Secretary, appointed by the Governor, is responsible to him.

Events, 1945. The influential newspaper *Nacion* of Santiago, Chile, reported that an attempt by German saboteurs, in March, to destroy the canal by blowing up a merchant vessel loaded with explosives had been uncovered. Another plot by Germans to blow up the Gatun Dam by landing saboteurs on board a submarine in the vicinity of the canal was also reported by a liberated Irish soldier whose aid had been solicited. The Republic of Panama took steps to insure the security of the canal by exercising greater vigilance and control over the issuance of visas and special permits to non-citizens.

In the Congressional hearings on bill H.R. 4480, Maj. Gen. Joseph C. Mehafee, Governor of the Panama Canal Zone, stressed the need for further investigation on increasing the security of the Panama Canal not only against the atomic bomb, but also against the conventional type of bomb. Further study was also recommended to determine the relative vulnerability of a lock canal as compared to a sea-level canal. Previous plans had specified that a third set of locks be 140 feet wide and 1,200 feet long. The existing locks were 110 feet wide and 1,000 feet long.

Locks in use were not wide enough to allow the largest Navy airplane carriers in service to pass through and the Navy Department went on record in favor of a width of more than 140 feet for the third set of locks. Between July 1, 1940, and June 30, 1945, about \$75,000,000 of the \$227,000,000 authorized by Congress had been spent on this project.

The capacity of the Canal was estimated to be 42,000,000 tons a year and the maximum traffic through the Canal in its two peak years, 1930 and 1939, amounted to 27,000,000 tons. It is also noteworthy that during World War II commercial and military traffic did not exceed peacetime peaks. Tolls collected during the war only totaled between 5 and 6 million dollars annually as compared with 27 million dollars in 1939. All ships carrying any amount of commercial cargo were required to pay tolls while ships carrying government cargo alone were not required to pay.

CHARLES F. REID.

PAN AMERICAN ACTIVITIES. Problems within and without the Continent confronted the American Republics in their international relations during 1945. Internally, the principal issue revolved around Argentina and its relations with other members of the inter-American community. Externally, the most important question confronting the Pan American system during the past year was its position in relation to the world organization.

The Argentine Question. In March the Argentine Government declared war against Germany and Japan, thereby completing the alignment of the Western Hemisphere against the aggressor states. Despite this act, the internal situation in Argentina continued to affect the general international relations of the American Republics throughout the year.

Toward the end of 1944 the Government of Argentina had proposed that the Governing Board of the Pan American Union convene a meeting of Foreign Ministers "to consider the existing situation between the Argentine Republic and other American nations." Because of the unwillingness of a number of governments to participate in such a meeting with representatives of the Argentine regime, action on the request was deferred. In February, the Inter-American Conference on Problems of War and Peace met at Mexico City, from which meeting Argentina was excluded.

The Argentine question was thoroughly discussed at Mexico, and a resolution adopted in which the Conference expressed the hope "that the Argentine Nation may put itself in a position to express its conformity with and adherence to the principles and declarations resulting from the Conference," and also that it might "orient its own policy so that it may achieve its incorporation into the United Nations." Shortly after the Conference Argentina declared war against Germany and Japan and signed the Final Act of the Mexico City conference, following which normal diplomatic relations were resumed with Argentina by the other Republics of the Hemisphere.

As a consequence of these measures the American Republics generally supported the admission of Argentina to the United Nations Conference at San Francisco. As a result of this backing Argentina was invited to take her seat with the other representatives drawing up the charter for the world organization, but only after a number of sharp exchanges that attracted wide attention.

The solidarity of the Hemisphere was again called into question in October when the United States indicated its unwillingness to participate with Argentina in a proposed conference at Rio de Janeiro, to draw up a permanent inter-American treaty of mutual assistance. At the suggestion of the United States the Rio de Janeiro conference was postponed to the spring of 1946. A further outgrowth of the Argentine situation was a proposal made by the Minister of Foreign Affairs of Uruguay in November, suggesting a limitation on the doctrine of non-intervention and the possibility of collective intervention to assure respect for certain fundamental rights and fulfillment of freely contracted international obligations. Although couched in general terms, the proposal was generally construed as arising out of conditions prevailing in Argentina.

The Chapultepec Conference. The Inter-American Conference on Problems of War and Peace met at Mexico City from Feb. 21 to Mar. 8. In addition to the action taken on the Argentine situation, the conference adopted sixty other declarations and resolutions.

Among the significant conclusions of the conference was the Act of Chapultepec, which declares that "every attack of a State against the integrity or the inviolability of the territory, or against the sovereignty or political independence of an American State," shall be considered an act of aggression against the other signatories. Similar declarations had been adopted previously by the American Republics in so far as their relations with non-American states are concerned. The innovation in the Act of Chapultepec is the fact that it is also directed at "an act of aggression of an American State against one or more American States."

Because of constitutional limitations confronting some governments, among them the Government of the United States, in accepting commitments of the nature involved, the Act of Chapultepec was given only a provisional form, to operate only for the period of the war. It was with a view to drawing up a permanent treaty to embody the principles of the Act that the Government of Brazil issued invitations for an Inter-American Conference for the Maintenance of Continental Peace and Security to meet at Rio de Janeiro on Oct. 20. Because of the unwillingness of the United States to participate in such a conference with representatives of the existing Argentine Government, the meeting was postponed. Subsequently, the Governing Board of the Pan American Union agreed that the conference should be held between Mar. 15 and Apr. 15, 1946, the exact date to be determined by the Government of Brazil.

Reorganization of Inter-American System. Another important resolution of the Mexico City conference related to the reorganization of the inter-American system, a broadening of the scope and a strengthening of the agencies through which it functions. The Governing Board of the Pan American Union was authorized to take action "on every matter that affects the effective functioning of the inter-American system and the solidarity and general welfare of the American Republics." This constitutes a delegation of political authority to the Governing Board, the exercise of which heretofore has been denied to the Pan American Union.

The conference further agreed that the Governing Board of the Pan American Union should be composed of special representatives appointed by the governments, and specifically precluded the appointment of members of the diplomatic missions accredited to Washington. This proposal received a majority vote at Mexico City, but it subsequently met with considerable opposition, partly because of a doubt as to the wisdom of the move and partly because of the additional financial burden that such special representation would entail. On the initiative of a number of countries opposing the change and as the result of an inquiry addressed to the governments, the application of this particular feature of the Mexico City resolution was suspended until it could be given further consideration at a future inter-American conference.

The Mexico City resolution also stipulated that the Chairman of the Governing Board of the Pan American Union shall be elected annually and shall not be eligible for re-election for the term immediately following. This provision was put into effect at the meeting of the Board held on December 5, at which time the Ambassador of Brazil, Carlos Martins, was elected Chairman for the coming year. At the same time the Ambassador of Paraguay, Celso R. Velázquez, was elected Vice Chairman.

The San Francisco Conference. In addition to the question of the admission of Argentina, a more

fundamental issue that presented itself at the San Francisco conference to formulate a charter for the United Nations was the question of the relation of the inter-American system to the world organization. Among the Latin American delegations there was a strong desire for a maximum degree of autonomy in the settlement of disputes and the preservation of peace in the Western Hemisphere. As finally drafted, the charter established a relationship between the world and regional systems which may be summarized as follows:

1. The Security Council may investigate any dispute that may lead to international friction or give rise to a dispute, but regional agencies or arrangements are primarily responsible for seeking a pacific settlement before disputes are referred to the Council.

2. The right of any group of nations to enter into agreements for self-defense is recognized. Consequently, the Act of Chapultepec and the permanent treaty that will embody the principles of the Act are entirely in harmony with the World Charter.

3. Should any nation party to such a defense agreement be attacked, the other contracting states may carry out their obligations to join in its defense, as an emergency measure and until the Security Council has taken measures to maintain international peace and security.

4. The Security Council retains the right to intervene directly whenever it may deem it necessary in order to maintain or restore international peace and security.

Economic Relations. Equally important as the political and diplomatic problems that arose during the year were those of an economic character. For the Latin American countries these were especially serious, as most of them had experienced a marked increase in production to meet wartime demands, and the conclusion of the war raised the problem of future markets for this expanded output.

Economic questions occupied a considerable part of the program of the Mexico City conference. One of the important conclusions of the meeting was the adoption of an Economic Charter of the Americas, which set forth a series of principles and a number of objectives which the American Republics would seek to achieve.

The conference also created an Inter-American Economic and Social Council, established by the Governing Board of the Pan American Union, and beginning to function on Nov. 15. Spruille Braden, Assistant Secretary of State of the United States, was elected Chairman of the Council, and Hector David Castro, Ambassador of El Salvador, was named Vice Chairman.

Preparations were also made for an Inter-American Economic Conference to meet at the Pan American Union on Nov. 15. Because of an inability to complete the preparatory studies, this meeting was postponed to April of 1946. In the meantime, the Economic and Social Council was requested to select and formulate recommendations on those economic and social problems of greatest urgency affecting the welfare of the American Republics.

L. S. ROWE.

PAN ARAB AFFAIRS. One of the things which many observers of Middle East affairs had long predicted could not happen was Arab unity. The Zionists in particular embraced this idea with fervor. The Arab was too much of an individualist, they maintained, and the different rulers of Arab countries were too jealous of each other ever to come to-

gether even in a loose political federation. The events of 1945 proved these prophets to be wrong. And it is no exaggeration to say that the most important factor in bringing about the Arab League was Zionism.

Even the Arab women, who are only on the threshold of emancipation after centuries of harem life, showed their solidarity at a historic meeting in Cairo (Dec. 14-15, 1944). Representatives were present from Egypt, Palestine, Trans-Jordan, Syria, Lebanon and Iraq, but not from Saudi Arabia, where Ibn Saud enforces strict seclusion upon all women.

Ibn Saud did, however, come out definitely for a Pan Arab league in January and promised to send representatives to the organizing conference at Cairo in February. Relations between Saudi Arabia and Egypt, somewhat cool in recent years, became friendly after King Farouk's visit to Ibn Saud in the Hejaz late in January (see ARABIA; EGYPT) and this also contributed to Arab solidarity. Even the Yemen was reported in early February to be ready to become a member of the proposed league.

The delegates from the Arab countries met in Cairo on Feb. 14 to begin preliminary conversations. As they convened the ticklish problems of Lebanese and Syrian independence and of Jewish immigration into Palestine were very much in the foreground. At this very time, too, President Roosevelt and Prime Minister Churchill visited Egypt and conversed with Middle Eastern personalities such as Ibn Saud, King Farouk, and the President of Syria. President Roosevelt gave the Arabian monarch an undertaking, later put in writing, not to take any decision with respect to Palestine "without full consultation with both Arabs and Jews" (see ARABIA; PALESTINE).

On Mar. 3 the delegates completed a draft constitution which was to be put before a plenary session on Mar. 17. Delegates from Tripolitania and Cyrenaica were allowed to present their cases but were not admitted as members. From the conflicting reports it was not altogether clear to what extent the Yemen was represented at, or committed by, the acts of the conference. Finally, on Mar. 22 the definitive pact was signed on behalf of Egypt, Saudi Arabia, Trans-Jordan, Lebanon, Syria, Iraq and apparently the Yemen. The unofficial delegate from Palestine did not sign, though it was provided that Palestine was to be represented on, and have a vote in, the League's Council.

According to the *London Times* (Mar. 23, 1945) the pact comprised twenty articles and two annexes. "The pact, which covers a wide field of Arab co-operation, says that the Union shall be composed of independent States which have signed it but that any other independent Arab countries are eligible for membership. The second article defines the Union's aims, which are the strengthening of friendship between the members, the coordination of their political action, and the safeguarding of their independence.

"The Union council will be composed of representatives of all member States, but each State will only have one vote, regardless of the number of its representatives. The council will supervise the carrying out of conventions concluded among the members. It will also study the means by which the Union shall collaborate with international organizations.

"It is forbidden to have recourse to force for the settlement of disputes between members. If differences should arise which do not affect the independence, sovereignty, or territorial integrity of

States and if the parties to the dispute have recourse to the council for settlement of it, the council's decisions shall be binding. Parties to a dispute will not have the right to take part in deliberations or decisions of the council. Decisions in matters of arbitration and conciliation will be taken by a majority vote. Decisions of the council which are made by unanimous vote will be binding on all members, but those made by a majority vote will only bind States that have accepted them. The Union's permanent headquarters will be in Cairo but the council may decide to meet in some other city if it wishes, and the council will meet twice yearly in March and October."

The League made its debut at the San Francisco Conference when, on May 1, the representatives of the five Arab states present there filed a copy of the Cairo Pact with the Secretariat and declared that they intended to act *en bloc*. Carrying out this intention, they took various occasions during the Conference to upbraid France for her policy in Syria and Lebanon.

The first meeting of the League's Council assembled in Cairo on June 4 at the very height of the Syrian crisis (see SYRIA AND LEBANON). The Council expressed its gratitude to Britain for her intervention in Syria and demanded of the French that they withdraw at once from the two Levant states. The delegates adjourned on June 11 after having discussed measures for preventing "French aggression." The first meeting of the economic and agricultural subcommittee of the League took place at Cairo in mid-July and discussed means for achieving greater cooperation between the member states.

At the Conference of Foreign Ministers which met in London during September and October, the Russians put forward a claim for the trusteeship over Libya. This elicited from the Secretary-General of the Arab League, Abdul Rahman Azzam Bey, the declaration that Tripolitania and Cyrenaica should be independent, but that if they were to be put under a trusteeship it should be conferred upon the Arab League or an Arab state.

The second ordinary meeting of the League Council began in Cairo on Oct. 31, with the Palestine and Tripolitanian questions in the forefront. Delegations from Tripoli and from the Tunisian Constitutional Party applied for admission, which of course could not be granted as they did not represent independent States. On Nov. 10 the Council voted unanimously to follow a common policy—not specified—in regard to Palestine. On Dec. 6 it issued a reply to Mr. Bevin's statement of Nov. 13 in the House of Commons by suggesting *inter alia* that the problem of the homeless Jewish refugees in Europe could be solved much more readily and happily by sending them to the United States. See PALESTINE.

ROBERT GALE WOOLBERT.

PANTELLERIA. An Italian island (32 sq. mi.; pop., 9,000) in the Mediterranean 45 miles from the coast of Tunisia and 62 miles from the Sicilian coast. Strategically situated to dominate the shipping route between the eastern and western Mediterranean, it was fortified by Italy during 1935-37. The island has two small ports. On June 11, 1943, the island was surrendered to Allied armed forces.

PAPUA. A territory (formerly called British New Guinea) of Australia, comprising the southeastern part of the island of New Guinea (87,786 sq. mi.) and the Woodlark, Louisiade, Trobriand, and D'Entrecasteaux groups of islands (2,754 sq. mi.).

Total area: 90,540 square miles. Population (1941): 3,070 whites and 337,000 natives (estimated). Chief ports: Port Moresby (capital), Samarai, Kulumadau, and Daru.

Production, Trade, etc. The chief export crops are rubber, gold, copra, and desiccated coconut. Sugarcane, breadfruit, sago, dyewoods, spices, ginger, nutmegs, and bananas are other products. Trade (1940-41): imports £539,152; exports £492,775. Ocean-going shipping entered and cleared the ports in 1940-41 totaled 489,469 tons.

Government. Finance (1940-41): revenue £189,518; expenditure £189,297 (including subsidy from the Australian Government amounting to £42,500). In 1945 the administration of Papua was under the Australia New Guinea Administration Unit (ANGAU), headed by Maj. Gen. Murray.

PARAGUAY. A republic of South America. Area: 150,500 square miles. Population: 1,040,420 (1941) Capital: Asunción.

The eastern third of Paraguay consists of a plateau of 1,000 to 2,000 feet elevation, to the west of which is an area of low flat plains and hilly uplands. Westward from the Paraguay River stretches the vast alluvial plain of the Gran Chaco, reaching an elevation of between 800 and 1,000 feet along the Bolivian border. The climate is sub-tropical, with considerable variation in the weather and in the amount and seasonal periodicity of rainfall.

Government. Paraguay is a centralized republic of 12 departments. Under the Constitution of 1940 a unicameral Congress of 40 members is provided for. The President is directly elected for a 5-year term, and is eligible only once for reelection. The President is aided by a Cabinet of 8 ministers. A plebiscite on Feb. 15, 1943 extended the term of President Higinio Morínigo for 5 years.

The People. The population of Paraguay is composed almost entirely of persons of mixed European and Indian descent. The west-central region around Asunción is the most densely populated; north-western and eastern areas are sparsely settled. The largest cities are: Asunción, 100,000; Villarrica, 50,000; and Coronel Oviedo, 30,000.

Both Spanish and Guaraní are spoken in Paraguay, but Spanish is the official language. Roman Catholicism is the predominant religion.

Recent surveys indicate that most of the population over 10 years old have at least an elementary knowledge of reading and writing. In 1941 there were 168,465 students in 2,096 primary schools; about 6,000 in 24 intermediate schools, and 1,108 students in the National University.

National Economy. Paraguayan economy is agricultural. Cotton is the leading export crop. Some tobacco is exported, and forest products, yerba maté and quebracho are exported in quantity. Sugar and rice are the chief crops grown for domestic consumption, with limited production of coffee and beans. Agricultural production figures for 1944 (in kilograms) are: quebracho, 47,266,433; sugar, 9,891,600; rice, 8,243,410. Maté production reached 16,657 metric tons.

Cattle-raising is an important industry; there are now some 5,000,000 head of livestock in the country. In 1944, about 513,200 head of cattle were slaughtered, about 69 percent for home consumption. Total slaughtering in 1944 by the three frigoríficos (principally for production of canned corned beef) totaled 161,024 head, of which 64,265 were imported.

There is little manufacturing in Paraguay, but industrial activity showed a general increase in

1944. Leading industries are: textiles, glass, and fiber hats. Foodstuffs, beverages, tobacco products, leather goods, paper manufactures, etc., are made in small quantities.

Foreign Trade. Paraguayan exports in 1944 were valued at 42,300,000 guaranies (19 percent above 1943 exports) and exceeding imports by 11 percent. The value of export groups in gold reserve pesos for 1944 were: animal products, 10,483,556; forest products, 7,336,740; and agricultural products, 5,473,620. Principal exports for 1944 (in kilograms) totaled: quebracho, 27,273,701; canned meat, 14,491,724; cotton, 6,801,631; maté, 4,193,516; tobacco, 2,511,536; whole hides, 442,997; and grain, 201,737. Lumber exports (chiefly logs and beams) amounted to 6,864 metric tons in 1944; corned beef exports totaled 14,496 metric tons.

Imports were valued at 38,100,000 guaranies in 1944, an increase of 3 percent over 1943. Foodstuffs, cotton and metal manufactures, and machinery were among the leading items imported.

Events. The year began in Paraguay with an early January manifesto in which President Higinio Morínigo assailed political parties as a threat to unity, and declared that the armed forces were the last refuge of the nation.

The Government suspended Associated Press wire facilities on Jan. 3, charging that the AP summary of Morínigo's Christmas speech, as published by *La Nación* of Buenos Aires, "implied repudiation of ideas and concepts which compromises Paraguay's position in the international concert." The Press and Propaganda Office canceled all official subscriptions to *La Nación*. The paper suggested, on December 26, that Morínigo display greater precision in his use of the word, democracy. On Jan. 5, the suspension was extended to include AP newscasts over Radio Teleco Paraguayo. The radio ban was lifted on Jan. 8, and the AP ban on Jan. 9, after an AP official had admitted in *La Nación* that the agency had "involuntarily misquoted" Morínigo's message.

On Jan. 12 the Press and Propaganda Office issued new press regulations which required all news agencies operating in the country to register with the Office and to submit copies of all despatches, incoming and outgoing, not later than 24 hours after they are filed. This was not censorship, the Office explained. A later decree, issued on Feb. 1, required all newscasts to devote at least one-third of their time to local items and ordered every station to broadcast news in Guarani for at least three minutes each day.

A general strike began in Paraguay on Jan. 24. Morínigo placed the Army in charge of the Central Railway, Light and Traction Company, and National Brewery, and the Asunción police head forbade workers' and students' meetings and outlawed street gatherings of more than four persons. *El Paraguayo*, the government organ, declared the strike was political rather than economic, and leftist circles in Montevideo said it was a protest against attempts by the Frente de Guerra, believed to be a pro-Argentine military group, to assume full power. The Labor Ministry announced on Jan. 27 that all public and private services had returned to normal.

On Feb. 21 the President decreed dissolution of all labor unions, until they could be reorganized under a projected labor code. The move was due to recent strikes, "provoked by political elements which have infiltrated workers' syndicates," the decree stated. Exiles reaching Montevideo, Uruguay, charged that hundreds of workers and students who participated in the general strike had been sent to concentration camps in the Chaco.

They added that democratic elements continued to fight the Government. One exiled labor leader claimed that an anti-Morínigo meeting was held in Asunción on May 1, and that the police had injured many who were celebrating the fall of Berlin.

The Government denied that there were concentration camps in Paraguay, and invited *El Pais* of Montevideo to investigate. A correspondent, Carlos Borche, was sent to Paraguay early in August and returned to Uruguay on Aug. 22. Borche wrote that he had established contact with Paraguayan democrats who gave him specific data on the number and location of political prisoners. While the stories of exiles might be exaggerated, he said, he had found many prisoners in the country.

In August, Finance Minister Juan Plate resigned. Officially, he was said to have left the Government for personal reasons. Later unofficial reports said that Plate's resignation was in protest against "enormous military expenditures." He was said to have made a significant reference to "generous donations" of arms to the Asunción Government by foreign regimes (presumably Argentina).

In a speech on Sept. 27 to commemorate the fifth anniversary of his assumption of power, Morínigo declared that the armed forces "will be the irrevocable source of a flawless discipline, and an active and zealous participant in the country's redemption."

Early in November it was reported that the President, frightened by the recent revolutions in Venezuela and Brazil, had adopted new precautionary and repressive measures, including a state of siege. Several opposition leaders had recently been sent to Chaco concentration camps, correspondents wrote, as a result of an upsurge of revolutionary activity. On Nov. 27 the Government authorized reopening of trade unions, which had been closed since February.

On Dec. 1, former President Rafael Franco urged the American republics to invoke the Act of Chapultepec against Morínigo, on the ground that the Paraguayan Government threatened hemisphere security. The Paraguayan Minister in Montevideo replied to Franco by attacking the former President's record in office, and asserting that the Asunción Government was complying faithfully with its international obligations, and that civil liberties were being reestablished in Paraguay.

An alleged revolt plot was discovered and suppressed on Dec. 7. An undisclosed number of opposition leaders were arrested. The plot was apparently limited to Asunción, and was said to have been instigated by Liberals and followers of Franco.

A new wave of arrests was reported later in the month. These were said to be the outgrowth of an intra-regime feud between Morínigo and Col. Victoriano Benítez Vera, commander of the Campo Grande garrison. The affair was reported to date from Oct. 19, when Benítez Vera ordered the dissolution of the President's personal bodyguard.

In his Christmas message, Morínigo scored the exiles who were assailing his regime from abroad. He declared that his administration had honored all its international obligations, and asserted that the exiles did not understand what he had done to put public works into construction and to aggrandize national prosperity for raising the standard of living.

During December the United States protested to Asunción against passages in a book by the Chief of Staff of the Paraguayan Army, Col. Bernardo Aranda, in which he made "objectionable and offensive" references to the United States, described war as an instrument of national policy,

and advocated industrialization of Paraguay for primarily military purposes.

HARRY B. MURKLAND.

PATENT OFFICE, U.S. Exceeding by 22,463 the number for 1944, applications for patents filed in the calendar year 1945 also reached the largest total in any other twelve months since 1931. Those for designs were 8,066, or 4,355 more than in the previous equivalent period.

This increase in the quest for the protection of patents and other demands for services from the Office illustrated the shift of invention toward conditions of peace. In the twelve months ended December 31, 1945, more than 4,000,000 copies of patents were purchased. The buyers of these were principally manufacturers, large and small. Never before had it been necessary to supply so many copies.

Still another evidence of the significance of patents in the era of reconversion was the use which owners were making of the public register which the Office initiated, by sanction of the President, in June, 1945. In this register may be included and published any patents the grantees or licensees of which desire to offer them for outright acquisition or partial use by others. In the six months following its inauguration more than 9,000 patents were so recorded.

Some of the principal corporations of the country registered their patents covering chemical, electrical, and other inventions.

While there was the exceptional rise noted in the number of applications, the total of those granted did not increase. In the preceding year there were 31,197 patents as against 29,364 in 1945. Of these latter 3,524 were for designs, an excess of 608 over the number granted in 1944. This decline in issuance was owing in large degree to the greater volume of business imposed on the Office and a shortage of technical and other personnel.

Trade-marks registered in 1945 numbered 7,493. This was 57 above the total for 1944.

Net receipts of the Office in the fiscal year 1944 were \$3,905,789, an increase of \$342,172 compared with the preceding twelve months.

CASPER W. OOMS.

PENTAGON BUILDING. Nerve center of the War Department, the Pentagon Building and adjuncts cost over \$74,211,504, cover 320 acres, and housed more than 33,000 government workers in 1943.

The mile-around, five-story main building contains 16 and one-half miles of corridors and a cubic volume of 90,746,000 feet. It maintains 700 janitors and charwomen. Security is enforced by 325 civilian guards and military police.

In September, 1942, a private branch telephone exchange, large enough to handle the services of a city of 125,000 population, was placed in service. The exchange requires a staff of 300 and its 125 operative switchboard positions handled more than 200,000 in-coming and out-going calls daily.

The War Department estimated that the building would pay for itself in eight to fourteen years, on the basis of what the Government would have had to pay to rent an equivalent amount of Washington office space. The Pentagon, costing \$17.01 per square foot of usable office space, was built at a lower cost per square foot than any comparable public building in Washington.

The cafeteria, with a personnel of 750, served more than 50,000 meals daily. In addition to the cafeteria, the Pentagon contains a dispensary, bar-

ber shop, bank, post office, drug store, and shopping center.

PERMANENT CHARITY FUND. A Fund established in 1915 by the Boston Safe Deposit and Trust Company to furnish a medium through which money may be left in trust to charity. The principal of the Fund is invested and the income distributed to existing organizations, usually of Boston and vicinity. Payments to charities during the fiscal year ended June 30, 1945, totaled \$250,997 and capital assets on that date were \$5,947,811. President: Roger Preston. Secretary: Arthur G. Rotch. Offices: 100 Franklin Street, Boston, Mass.

PERMANENT JOINT BOARD ON DEFENSE—United States and Canada. A Board set up by President Roosevelt and Prime Minister W. L. Mackenzie King in pursuance of a joint communiqué dated Aug. 17, 1940, to "commence immediately studies relating to sea, land, and air problems including personnel and material" and "consider in the broad sense the defense of the north half of the Western Hemisphere." Chairman: U.S. Section, Fiorello H. LaGuardia; Canadian Section, Gen. Andrew B. McNaughton.

PERU. A republic of South America. Area: 482,258 square miles (1940). Population: 7,395,687 (1943). Capital: Lima.

The country is divided from west to east into three natural regions: the coastal area along the Pacific Ocean; the sierra, or central highland; and the montaña, a region east of the Andes including piedmont slopes and lowlands. The climate of the west coast is cloudy and cool; that of the highlands varies from very wet during the rainy season between October and April, to very dry; the montaña is excessively rainy and generally hot and humid. Temperatures vary according to exposure and altitude.

Government. Peru is a centralized republic of 22 departments, under its Constitution of 1933. It has a bi-cameral Congress: a Senate of 49 members, and a Chamber of Deputies of 152. The Congress meets annually on July 28 for regular sessions of 120 days. The President is assisted by a Cabinet of 11 ministers, and is elected for a 6-year term. Dr. José Luis Bustamante y Rivero was elected President on July 10, 1945, and took office on July 28.

The People. According to the census of 1940, 53 percent of the population of Peru is white and mestizo, and 46 percent Indian. Densities per square mile vary from 0.4 in the Department of Madre de Dios to 56.4 in the Department of Lima. The three largest cities are: Lima, 534,000; Callao, 84,000; and Arequipa, 79,000.

Spanish is the official language, but about half of the population speak Indian languages. The Roman Catholic religion is protected by the state.

The 1940 census showed 42 percent of the population to be literate; the highest proportion of literacy was reported from the coastal region, the lowest from the jungle area. In 1941 there were 99,325 students in 74 intermediate public schools; five universities had a total student body of 5,033. In 1945 primary school enrollment totaled 717,162. Four national high schools, 27 normal schools, and 35 advanced training centers for teachers have recently been established.

National Economy. Peru's economy is principally agricultural and pastoral, but mining and manufacturing contribute substantially to the national income. Peru is the second largest producer of cotton in Latin America, the 1944 crop reaching 67,114

metric tons. In addition to cotton, sugar is an important export crop, while wheat, rice, corn, barley, oats, and potatoes are grown for home consumption. Production of sugar in 1944 totaled 444,000 short tons; of rice, 916,305 bags of 100 kilograms each. The livestock industry provides most of the local demand for meat. There were about 14 million sheep and 2.3 million cattle in Peru according to the 1941 livestock census. Wool (sheep, alpaca, llama, and vicuña) is an important export product; some hides and skins are also exported. The chief forest products are rubber and cinchona.

The petroleum industry is one of the most important factors in the economic structure of Peru; petroleum and its derivatives account for about 30 percent of the total mineral output of the country. In 1944 crude petroleum production totaled 14,385,926 barrels. Copper, gold, lead and silver are next in importance. Peru is among the four principal silver-producing countries of the world, although silver production has declined during the past ten years because of increased mining costs and the use of lower grade ores. Total production in 1944 was 492,444 kilograms. Copper production in recent years has been about 37,000 metric tons per year; in 1940, 44,000 metric tons were produced, in 1943 output was estimated at 36,572 metric tons. Peru produces about one-half of the world output of vanadium, as well as coal and zinc. The total value of mineral production in 1944 reached 390,000,000 soles.

Peruvian manufacturing has developed considerably since 1929. Local industries now supply a large part of the home market for many types of consumer goods. The cotton textile industry is one of the most important manufacturing enterprises; other leading manufactures include woolen and leather goods, cement, chemicals, tobacco, glass, paper, foodstuffs, pharmaceuticals, and beverages.

Foreign Trade. The value of Peru's foreign trade in 1944 amounted to nearly 1,062,000,000 soles, an increase of about 17 percent over 1943. The value of imports increased 14 percent; that of exports 19 percent. Leading export items were: sugar, petroleum derivatives, copper, cotton, lead, mineral concentrates, wool, gold, flax, bismuth, elastic gums, silver articles, hides and skins, and fish. The United States took 36 percent of the total value of exports; Chile 24 percent; Bolivia 7; Great Britain 4. In 1944 exports of gasoline totaled 449,372 metric tons, fuel oil, 627,292 metric tons, kerosene, 91,221 metric tons; cotton exports amounted to 574,094 quintals; silverware, 13,698 kilograms, valued at 3,687,445 soles.

Leading imports in 1944 were: wheat, machinery, rice, butter, wood, iron and steel, piping, jute bags, trucks and chassis, fertilizers, tires, rails, automobile parts, petroleum lubricating oils, and agricultural tools. The United States supplied 54 percent of the total value of Peruvian imports, Argentina 18, Chile 5, and Australia 4 percent. In that year, Peruvian imports of pharmaceutical specialties were valued at 12,900,000 soles; tools (exclusive of Lend-Lease) at 12,300,000 soles; machinery and motor vehicles at 77,000,000 soles; iron, steel, and aluminum products at 31,500,000 soles; crude and processed metals at 15,300,000 soles; and stones, earthenware, including chinaware, glassware, cement, etc. (excluding Lend-Lease items) at 10,600,000 soles.

Events, 1945. Former President Oscar Benavides withdrew his candidacy for President of Peru in a letter published on Jan. 6 in the weekly *Jornada* of Lima. He urged the candidacy of a civilian for the presidential post to prevent a division within the

Army. "The armed institutions, which are the motherland's personification, cannot—must not—be divided," the former President declared. "Their division, a supposition which I reject, would mean national collapse. They are the only organized institutions existing in the country." The exiled Aprista faction headed by Manuel Seoane congratulated Benavides for his "patriotic manifesto" and asked permission to return to Peru from Chile to participate in the forthcoming election campaign.

On Mar. 16, General Eloy G. Ureta, former Inspector-General of the Army, officially announced his presidential candidacy and his platform. He sought "national unification, liberty and order," he declared. "... I am a man of the people ... without prejudice of class or party." *El Comercio* of Lima announced its support of Ureta, on the ground that a civilian candidate was not opportune because there were no traditional political parties in the country.

The presidential campaign was interrupted on Mar. 18, when a revolt plot was frustrated at the Ancon air base, 25 miles north of Lima. Two non-commissioned officers and a number of enlisted men who allegedly planned to seize Air Minister Fernando Melgar were arrested. Melgar quickly "reestablished discipline" and "complete tranquility." The official statement charged that the plotters had been in contact with the outlawed People's Party (former Alianza Popular Revolucionaria Americana, or APRA), which had attempted, "without success, to undermine the discipline of the armed forces."

Politics was resumed the following day, when the Frente Democratico Nacional, an anti-Administration coalition, launched the presidential candidacy of José Luis Bustamante y Rivero, Ambassador to Bolivia. Bustamante's platform urged separation of church and state, "constitutional and democratic readjustments, purging of political methods, administrative moralization, advances in social justice, and strengthening of Peru's international personality." In addition to the Frente Democratico Nacional, Bustamante was backed by the Apristas, Syndicalists, Socialists, and followers of Benavides, who personally endorsed Bustamante.

On Apr. 8 the Interior Ministry reminded political groups, as their activity increased, of legal restrictions on campaign demonstrations. Meetings must be held only in approved public places, the statement warned, and parades and other forms of "collective transit" of demonstrators were prohibited. Exiles of both the left and right returned to Peru with the Government's permission. The National Election Board ruled on May 18 that the People's Party would be permitted to participate in the elections.

The influential Lima daily, *La Prensa*, withdrew its support from Ureta in May because it was dissatisfied with the congressional candidates running on his ticket, and on May 19 the conservative Union Revolucionaria party took the same step, asserting that his campaign, backed by the Prado Administration, was designed "to maintain in power the same men, with the same methods."

All campaigning ended on June 8, according to law, and the election for President, two Vice Presidents, 49 Senators and 152 Deputies was held on June 10. President Manuel Prado had promised that the vote would be "free, impartial, and democratic," and that the Government would act with "absolute impartiality and without discrimination of persons or political parties," and he was as good as his word. No disorders or irregularities were reported and an estimated 750,000 voters went to the polls.

Bustamante assumed an immediate lead as the vote-counting started, and on July 21 the National Election Board officially proclaimed him President-elect, with 305,590 votes against 150,720 cast for Ureta. The Senate's 49 seats were apportioned among 21 Apristas, 12 National Democratic Front candidates, 6 independents, 3 "Pradistas," and 4 Socialists, returns on 3 seats being annulled. The 153 seats in the Chamber of Deputies were distributed among 46 Apristas, 10 National Democratic Front candidates, 55 independents, 28 Pradistas, and 2 Socialists, with 12 annulments.

The new President was inaugurated on July 28. Although the Apristas pledged their support, and the Cabinet was drawn up in consultation with Aprista leader Victor Raúl Haya de la Torre, no members of that party took Cabinet posts.

The new Congress assembled on the same day. Among its first acts were abolition of the 1936 "emergency laws," which had restricted political activity and the press; termination of the 25-year-old censorship on incoming and outgoing news, and a general amnesty for all political prisoners, together with an invitation to remaining exiles to return to Peru.

"There will be no dictatorship or extremism," Bustamante declared in his inaugural address. His administration would "seek real solutions and will attempt to create methods to face" postwar problems. The new administration, in a drive to curb unnecessary expenditures, ordered the termination of secret appropriations and subventions for political purposes. The Agriculture Ministry on Aug. 9 ordered strict compliance with a standing law which requires that 40 percent of all farm land be devoted to production of food. The Ministry of the Interior decreed suppression of the Social and Political Brigades of the police force, described by leftists as a "Peruvian Gestapo."

Public attention turned in September from the legislative halls in Lima to the city of Cuzco, where there was an open break between Communists and Apristas. Some 250 Communists attempted to seize a hall in which Haya de la Torre was scheduled to speak, and Communist workers demonstrated against him in the streets because of alleged anti-labor remarks in an earlier speech. Police and troops intervened and several persons were reported seriously wounded. The Cuzco labor federation thereupon called a strike.

Hostility between Apristas on the one hand and Communists and Socialists on the other spread to Congress. And 40 re-elected and independent Congressmen formed a "parliamentary union" to oppose the administration's Aprista-National Democratic Front legislative program.

The entire Cabinet went out on Oct. 4 in sympathy with Finance and Commerce Minister Romulo Ferrero who resigned after his report on government political and economic measures had been severely criticized in the Senate. A reorganized Cabinet was named on Oct. 7.

On Oct. 30 President Bustamante broadcast his first message to the Peruvian people. He reviewed the opening three months of his Administration and pledged solution of the country's two greatest problems: improvement of living conditions and stabilization of finances. Promising action to reduce price levels and to construct low-cost housing, he predicted that within a few years oil would prove an important source of national income. Plans for electrification and increased manufacturing were outlined. "Peru is passing through a temporary depression," the President said, but "the commercial situation is becoming daily more favorable, espe-

cially in the matter of sugar and silver exports." Investment of foreign capital was increasing and commercial credit was being established abroad. He declared that his Cabinet was non-political and that he regarded himself as a "centrist mandatory seeking coordination and good understanding" with Congress.

A new press law, backed by the administration and designed to prevent abuse of the newly-granted freedom of the press, was passed by the Senate on Nov. 15. The law: (1) empowered the Supreme Court to close down any newspaper guilty of violating civil liberties; (2) provided that newspaper publishing companies must issue registered shares only, and that those having bearer shares outstanding must convert them into registered shares within 60 days; (3) directed publishers to furnish complete data on capitalization, ownership, and loans or mortgages outstanding, and to publish a complete list of owners and shareholders once a year.

Supporters of the bill argued that these provisions were a safeguard against the danger that enemies of democracy might shield themselves behind newspaper anonymity. The large conservative newspapers of Lima, such as *La Prensa* and *El Comercio*, led the fight against the bill, declaring that freedom of the press cannot be regulated by law. When a group calling itself the Committee for Defense of Freedom of the Press held a public meeting on Nov. 19, Apristas interrupted the speakers and a riot followed. The bill was passed by the Chamber of Deputies on Nov. 23.

On Nov. 29 the Apristas held a great public demonstration against the "reactionary press," which continued to attack the new press law. On Dec. 7 the President declared that the debate on the press law, which he had not yet signed, had taken on a passionate political bias which menaced the integrity of the administration coalition. That same night opponents of the bill, supported by Socialists, Communists and other disaffected members of the coalition, held a counter-demonstration to that of the Apristas. Two were killed and at least 26 injured when the demonstrators clashed with Apristas. The Apristas reportedly set fire to the headquarters of the extreme rightist Revolutionary Action Party, and two buildings were burned. Congress by a vote of 158 to 3 on Dec. 13 registered confidence in Interior Minister Rafael Belaunde and the Cabinet, after Belaunde had made an extensive explanation of responsibility for the riot, which he blamed on the organizers of the original demonstration against the press law. The President signed the law after Congress had deleted its most controversial provision, which would have empowered the Supreme Court to close any paper which violated "civil liberties."

Finance Minister Carlos Montero Bernal returned to Lima late in December after a visit to the United States during which he negotiated a debt-servicing agreement and a \$30,000,000 Export-Import Bank credit extension.

HARRY B. MURKLAND.

PETROLEUM ADMINISTRATION FOR WAR (PAW). Created May 28, 1941, by President Roosevelt in a letter to Secretary of the Interior Harold L. Ickes, naming him Petroleum Coordinator for National Defense. Mr. Ickes appointed Ralph K. Davies, of California, Deputy Petroleum Coordinator. On Dec. 2, 1942, the office of Petroleum Coordinator for National Defense was redesignated Petroleum Administration for War, with Mr. Ickes as Administrator and Mr. Davies Deputy Administrator. See 1943 and 1944 Year Books for authority and duties

of Administrator and 1945 Year Book for outline of organization.

The function of PAW was to assure adequate supplies of petroleum and petroleum products for military and essential civilian needs of the United States, and in cooperation with appropriate agencies of other governments perform the same function for the United Nations. Through an effective partnership with the petroleum industry, organized under the Petroleum Industry War Council headed by William R. Boyd, Jr., the Foreign Operations Committee, and numerous district committees and subcommittees, the PAW mobilized the oil resources of non-Axis powers for most efficient use in the war program.

The personnel of PIWC, its various committees and subcommittees serving without pay, reached several thousand during the war period, but PAW operated with 1,483 employees at the peak in 1944. It is now in process of liquidation, having rescinded most of the wartime restrictions and cut personnel to 100 as of January 1. The agency is expected to be entirely liquidated by June 30, 1946, the end of the current fiscal year.

From the time the agency was established in 1941 until about V-J Day, crude production of the United States rose from 3,772,000 barrels a day to 4,940,000 barrels a day and in the foreign supply available to the United Nations, exclusive of the U.S.S.R., from 1,600,000 barrels a day to 1,850,000 barrels a day. Aviation gasoline production of the United Nations rose from 80,000 barrels a day at Pearl Harbor to 600,000 barrels a day, of which the United States was producing more than 525,000 barrels a day, on V-J Day. Since PAW took over the aviation gasoline program five months before Pearl Harbor, more than 360,000,000 barrels were produced up to the end of the war. Total crude production for the United Nations, exclusive of the U.S.S.R., during the war period was approximately 7,500,000,000 barrels.

HAROLD L. ICKES.

PETROLEUM CONSERVATION DIVISION. A Division of the U.S. Department of the Interior, established in 1936 to assist the Secretary of the Interior in administering the Connally law, which prohibits the shipment in interstate and foreign commerce of petroleum or its products produced in excess of the amount permitted by State law. The Division acts as the contact agency with the Interstate Oil Compact Commission, and also supervises operations of the Federal Petroleum Board. Acting Director: Edward B. Swanson.

PHILANTHROPY. A new record of American philanthropy was indicated in the annual report of The John Price Jones Corporation. This study showed that in eight of the nation's largest cities publicly announced gifts in 1945 totalled \$191,134,648, an increase of 18.57 percent of the \$161,198,206 contributed in the same cities during 1945.

Publicly announced bequests for 1945 in these cities—New York, Chicago, Philadelphia, St. Louis, Los Angeles, Boston, Baltimore and Washington, D.C.—totalled \$18,171,649 compared with \$34,677,696 in 1943, a decline of 47.6 percent. This decrease does not necessarily indicate a downward trend since it is likely that many wills of wealthy persons may not have been offered for probate during 1945.

According to the study, \$121,522,582 in these eight cities was given to organizations connected with the war effort, such as the Red Cross and the National War Fund. Educational institutions re-

ceived \$21,281,790, with several gifts of \$1,000,000 and more; organized social work agencies received \$21,514,465; and health agencies and hospitals received \$15,480,938.

As in the past, New Yorkers gave the greatest amount, \$91,569,332, followed by Chicago, \$23,352,485; Philadelphia, \$19,186,213; Los Angeles, \$15,704,580; Boston, \$13,568,268; Baltimore, \$9,923,366; Washington, D.C., \$8,864,391; and St. Louis, \$8,776,013.

PHILIPPINE ISLANDS. A group of islands in the Western Pacific Ocean, ceded to the United States by Spain on April 11, 1899, conquered by Japanese armed forces in 1942, and liberated in February 1945. The Tydings-McDuffie Act of March 24, 1934, created the Philippines an autonomous commonwealth, and provided for them to become fully independent on July 4, 1946.

Area. The combined area is 114,400 square miles. This comprises 7,083 islands, of which only 466 cover as much as one square mile apiece. Two islands, Luzon (40,814 square miles) and Mindanao (36,906 square miles) account for more than two-thirds of the whole area. Others, with their respective areas in square miles, are Samar, 5,124; Negros, 4,903; Palawan, 4,500; Panay, 4,448; Mindoro, 3,794; Leyte, 2,799; Cebu, 1,695; Bohol, 1,534; and Masbate, 1,255.

Government. Under the Tydings-McDuffie Act of 1934, a Philippine constitutional convention drew up a Constitution which was approved by popular vote and went into effect Nov. 15, 1935. It vested wide executive powers in a President elected by popular suffrage for six years and legislative authority in a one-chamber National Assembly of 98 members elected for three years. Constitutional amendments adopted in 1940 reduced the Presidential term to four years; revoked the former clause barring reelection of a President (but two successive terms only were permitted); established a bicameral Congress, with Senators elected at large, in place of the National Assembly; and established an independent electoral commission to supervise elections.

Events, 1945. In January, Gen. Douglas MacArthur caught the Japanese napping with unopposed landings on the southern and southeastern shores of Lingayen Gulf. U.S. troops of the Sixth Army supported by the Seventh Naval Fleet, with 1,033 ships and 273,000 men, and the land-based bombers of the Far Eastern Air Force, established four beachheads, with one beachhead located 100 miles north of Manila. During February all efforts were concentrated on the drive for the liberation of Manila. It was in the midst of these concerted attacks that the "angels of Bataan and Corregidor," the American Army nurses, who cared for the wounded, were liberated from an internment camp. Rangers liberated 513 survivors of the Bataan march at Cabanatuan while the First Cavalry liberated 3,700 internees at Santo Tomas.

Within 26 days after the initial landings at Lingayen Gulf, Manila was liberated from Japanese tyranny and oppression by troops of the Sixth and Eighth Armies, the Thirty-Seventh Division of the National Guard, the Eleventh Airborne Division, the First Cavalry, and the soldiers of the Philippine Commonwealth. The fall of Manila was formally announced Feb. 6, at 6:30 A.M. Manila was ravaged by fire and shell and few if any buildings were standing after the Japanese were driven out. The Cavite naval base, Corregidor, and Bataan fell shortly thereafter.

In the midst of the mop-up campaign General

MacArthur restored civil government in the Philippines and turned over the government to President Sergio Osmena in an impressive ceremony that was held Feb. 27 at Malacan Palace, the Manila White House. President Osmena pledged his administration to close collaboration with the United States and to the principles of freedom and democracy. President Truman stated that he was in favor of early independence and that he endorsed the Philippine policies of the late President F. D. Roosevelt.

The restoration of civilian government brought to the fore the question of free trade and preferential treatment without which Philippine industry could not meet foreign competition in the American market. United States tariff barriers against Philippine products would disrupt the whole Philippine economy because 83 percent of its exports and 78 percent of its imports involve the United States.

Sen. Millard Tydings (D), Chairman of the U.S. Senate Committee on Territories and Insular Affairs and the Filipino Rehabilitation Commission, was directed by President Truman to conduct a survey of the islands as his special envoy. The Senator visited the islands in May but cut his trip short to make a report on conditions which "were beyond description." The extent of the devastation and destruction, the lack of shelter, the millions in need of food and medical supplies, all amazed him. Upon his return he called for an outright appropriation of \$100,000,000 for rehabilitation purposes, an immediate large-scale public purposes loan, and Federal aid for reconstruction work.

The total amount of war damage inflicted on private business and individual property and public buildings between Dec. 7, 1941, and May, 1945, was estimated at \$800,000,000 to \$1,000,000,000. Only property destroyed up to July 1, 1942, was insured by the War Damage Corporation. Bills were introduced in the U.S. Senate providing for the payment of all war damages, but no action was taken during 1945.

The first session of the Philippine Congress, June 9, consisted of members who had been elected on Nov. 19, 1941. Of the 98 House members, 70 were present, 11 dead, and 17 under detention. Of the 24 Senate members, 13 were present, 2 dead, and 9 under detention. Since the terms of all House members and two-thirds of all Senate members were to expire Dec. 30, 1945, President Truman asked Congress to authorize a general election for national offices not later than Apr. 30, 1946, and that those elected take office not later than May 28, 1946.

Paul V. McNutt was appointed U.S. High Commissioner to the Philippines by President Truman. Assisting him as Chief of Staff was Maj. Gen. William F. Rose; Economic Advisor, E. D. Hester; and Legal Advisor, Capt. Myron C. Erlich. The first task assigned by President Truman was the disbandment of the guerrilla army. The progress of economic rehabilitation and the return of the islands' industries to commercial production also was to be studied.

Population. The population was estimated at 16,771,900 on Jan. 1, 1941. The city of Manila had (1939) 623,362 inhabitants. In 1937 the Commonwealth enacted legislation making Tagalog one of the official languages, effective in 1946. One out of eight persons had some knowledge of English, and one out of sixteen, of Spanish. The Roman Catholic Church had the greatest following on the islands.

Education. The literacy rate was 48.8 percent at

the time of the 1939 census. In March, 1940, the public school system included 12,057 schools, 43,763 teachers and administrators, and 1,940,729 pupils. In addition there were 439 private schools with 149,491 students.

Economy. Agriculture was the main support of the islands before the war, followed by mining and manufacturing. Sugar and rice are the most important agricultural export products. Copra was next, followed by abaca, tobacco, and forest products. The most important mineral products are gold, iron, chrome, manganese and copper. Cotton embroideries were the most important manufacture.

CHARLES F. REID.

PHILOSOPHY. Owing to circumstances connected with the war, the output of philosophical books was restricted this year, and very few important ones appeared. A ruling of the ODT also dissuaded the American Philosophical Association from holding its annual meetings in the East, the West, and the Pacific Coast. On the other hand, the periodical literature, though some journals here and in England were reduced in size, appeared as before.

Bertrand Russell's *A History of Western Philosophy and its Connection with Political and Social Circumstances from the Earliest Times to the Present Day*, which appeared this year, is unique in a number of respects. The author, whose contribution has been in the field of logical analysis, has never made a special study of any philosopher of the past except Leibnitz. He has produced something new and stimulating, however, by supplying the social and political context, missing in almost all histories of philosophy, by including such philosophers as Rousseau and Marx, who are not usually discussed, and by exercising his caustic wit and critical talent at the expense of practically everyone. Although designed more for the educated public than for professional philosophers, the latter will also find it profitable. For example, Russell answers Parmenides' paradox that "thinking about nothing is the same as not thinking" in terms of his own theory of descriptions, made famous by its use in *Principia Mathematica*. The assertion that "Hamlet was Prince of Denmark," which is an assertion about nothing, i.e. a non-existent, is true only if construed as: "Shakespeare says that there was a Prince of Denmark called 'Hamlet'". In the same way all statements about unicorns or other fabulous animals are really about the word "unicorn," or other such words (p. 50). Similarly, in criticizing Plato's argument in the *Theaetetus*, Russell makes use of his theory that classes, and hence numbers, are logical fictions. Numbers are not properties of things but of concepts. It is thus a mistake to say that "the moon is one." We should say: "There is a *c* such that '*x* is a satellite of the earth' is true when, and only when, *x* is *c*'" (p. 157). This is familiar to logicians but novel in a general history of philosophy. Russell's treatment of Aristotle's metaphysics, his doctrine of form and matter, universals, essence and so on will seem to many readers extremely cavalier. The problem of universals (p. 164) like the problem of essence (p. 120) is merely a confusion about the use of words. On the other hand, the criticism of Aristotle's logic and physics in the light of modern science is instructive and valuable. A great deal of general history is wisely included in the medieval section of the book, and medieval philosophy is judged not only according to norms of modern science and "liberalism" but also in relation to the limitations of the 11th, 12th, and 13th

centuries. The treatment of the moderns is often arbitrary. In the nineteenth century only a few philosophers are considered, and the book ends with a brief account of John Dewey and several pages on "The Philosophy of Logical Analysis," which represents Russell's ideal. Most interesting, at the end, is Russell's appraisal of Dewey. He agrees with the common verdict that Dewey is the greatest of American philosophers. "The main difference between Dewey and myself," Russell says, "is that he judges a belief by its effects, whereas I judge it by its causes where a past occurrence is concerned." (p. 826). Russell says that nothing we do in the future can change the fact that "Caesar crossed the Rubicon." For him a judgment is true if it *corresponds* with the past event, whereas for Dewey we are *warranted in asserting* it if this has certain satisfactory results.

Another important historical work is Ralph Barton Perry's *Puritanism and Democracy*, which attempts to salvage the truth of puritanism and to show its consistency and continuity with developing American democracy. The link which joins puritanism and democracy is individualism, that is, the metaphysical esteem for the individual as the only reality that counts. Perry's individualism does not exclude collectivism or planning, though the plan must somehow take account of the claims of "any" individual. Puritanism is said to resemble democracy in recognizing equality before God, in rejecting an intermediary, and in hating all tyrants. A related phase of American thought is treated by Richard Hofstadter in *Social Darwinism in American Thought*. The impact of various concepts of Darwinism is traced. There is the struggle-for-existence individualism propagated by Spencer, and usually called "social Darwinism," which was warmly received in American business circles, but there is also a kind of collectivism which stems from Darwin. Both are to be distinguished from the biological import of Darwin's work. Whereas Hofstadter makes distinctions, William S. Quillian, Jr., in *The Moral Therapy of Evolutionary Naturalism*, rejects the entire conception of evolutionary ethics in favor of a religious normative ethics. Another important, if belated, contribution to the history of philosophy is Jeremy Bentham's *The Limits of Jurisprudence Defined. Being Part Two of an Introduction to the Principles of Morals and Legislation*. This book which is now first printed from the author's manuscript, does not attempt to elaborate the complete and ideal set of laws that Bentham dreamed of, but only to lay the foundations for it.

A number of articles have appeared on the theory of history. Morton C. White in "The Attack on the Historical Method" (*Journal of Philosophy*, vol. xlii, no. 12) maintains that the historical explanation upheld by the historicist is not mere chronicle, but "dynamic generalization," i.e., history facilitates predictions of later from earlier stages. The author gives an example from the historian, Henri Pirenne: "Every class of capitalists is at the beginning animated by a clearly progressive and innovating spirit but becomes conservative as its activities become regulated." In another interesting article, "Generality and Singularity" (*Journal of Philosophy*, vol. xlii, no. 3), Albert Hofstadter argues that historical preoccupation with singularity is not incompatible with laws. "The differences between universal and singular judgments are mainly functional. Hence generality of law and singularity of reference are perfectly compatible."

In the field of social philosophy we have Bene-

detto Croce's *Politics and Morals*. The eminent Italian philosopher takes the paradoxical view that in every state, despotic or liberal, "authority and liberty are inseparable" (p. 14) and we emphasize one or the other according to the taste of the times. Authority presupposes liberty because "it is only to be found with respect to what is alive, and only what is free is alive" (p. 111). In spite of this, Croce has a decided preference for liberalism as a way of life and as a political form, and defines it in sharp contrast to theocracy, both Catholic and socialist. The promised paradise, whether Catholic or socialist, must be imposed ready made. The spontaneity and diversity of individuality in the name of equality, or equality before God, is thus stifled in either case. To such a negation of "struggle and of history" liberalism is steadfastly opposed. Indeed, it is so much opposed that Croce seems to agree with Gladstone that liberty "is the means of creating and promoting aristocracy, not democracy." Aristocracy, Croce adds, "is truly vigorous and serious when it is not a closed but an open aristocracy, firm in keeping the common people away, but always ready to welcome those who have elevated themselves to its level" (pp. 118-19).

Whereas Croce attempts to determine what is right and good, Charles L. Stevenson (*Ethics and Language*), represents a different type of ethical writing, which is concerned only to clarify the meaning of such terms as "right" and "good." The book is a sequence of linguistic distinctions and clarifications designed as an aid to ethics proper, i.e. normative ethics. For example, ethics involves agreement and disagreement. What is meant by these terms? Stevenson distinguishes between agreement in belief and agreement in attitude, and insists that the distinction holds even when the beliefs are about attitudes. It is also important to distinguish between disagreement in belief about attitudes and disagreement in attitudes. Obviously these different kinds of agreement and disagreement are all involved in ethical situations, but in different ways. The type of tentative conclusion which the author's cautious method permits is illustrated by his discussion of the exceedingly important question of the validity of ethical judgments. The validity of ethical judgments may not be parallel to the validity of judgments in inductive and deductive logic because attitudes are involved in the former case. Nevertheless there is a sense, Stevenson says, "in which 'That is true' signifies agreement not in belief but in attitude. Although not found in science, this sense is useful in ethics. . . . It may accordingly seem feasible to recognize a corresponding sense of 'valid,' in which a reason, if true in the ordinary sense, may validly establish an ethical judgment as true in this special sense" (p. 173). The author's difficulty in giving a meaning to validity in ethics arises from the sharpness of the contrast he draws between verification procedures in science and ethics.

Present-day literature bears witness to the growing recognition of Marxian philosophy. Vernon Venable (*Human Nature: the Marxian View*) has attempted a systematic exposition of the Marxian theory of human nature from scattered and partly untranslated sources. The aim is faithful delineation, not special interpretation. In contrast to Venable, who makes no reference to critics or interpreters of Marx, Harry Slochower (*No Voice is Wholly Lost: Writers and Thinkers in War and Peace*) discusses a whole assemblage of modern writers, mostly literary men, and traces their waverings and insights, their approach to

Marxian conceptions or their retreat in some cases, to mystical absolutes. On the basis of early writings of Marx, the author maintains that, in the Marxian view, permanence is as important as change, and essential to it. Thus scientific laws may remain permanently valid and literature, permanently valuable, throughout the historical process.

In current contrast to the Marxian view of history is "psychodynamics," or explanation of history in terms of basic personality structure. Abram Kardiner (*The Psychological Frontiers of Society* p. 414) lists four disciplines which have contributed to the interpretation of historical data in the 20th century: the theory of evolution, the social theories of Marx, cultural anthropology and psychodynamics. Kardiner makes use of the last in a program of research and theoretical construction which is announced and exemplified in the above book. Jerome Frank (*Fate and Freedom*) employs the third method of interpretation, i. e. cultural anthropology. Opposing all supposed laws of history, particularly the Marxian, Frank insists that science gives no warrant for determinism, that men are free to make their own history, or as James said, to make their ideas true. In a final chapter, "Towards a New Synthesis," he urges religions to compound their differences in a common practical program, and he praises an inclination to pragmatism which he finds even within the Catholic Church. Erich Frank (*Philosophical Understanding and Religious Truth*) is mainly concerned with a vindication of religion. Its truth and relevance emerge, he says, whenever man is faced with "the inevitability of death, of suffering, of struggle, and of guilt." The task of the philosopher is to grasp the essence of religion, its eternal revelation, and to separate this from the historical accidents. The philosopher must recognize "his own philosophizing as a mere simile . . . a symbol, a cipher of the absolute." Then he will not be "tempted again to replace the concepts of religion by his own rational ideas" (p. 164) for he will realize that there is a higher truth which he can never attain. Freedom, like reason, is limited by necessity which is, ultimately, divine necessity. *The Authoritarian Attempt to Capture Education*, consisting of papers from the second conference on the Scientific Spirit and Democratic Faith, defines freedom as exemption from restrictions. John Dewey, Sidney Hook, Arthur E. Murphy and other contributors, in brief papers, discuss standards of freedom in politics, education, communications, etc.

In the field of logic an interesting development was the appearance of a series of articles (*Journal of Philosophy*, Jan. 4, Feb. 18, April 26) by John Dewey and Arthur F. Bentley. These authors make a vigorous attack on "a certain vagueness in logic," as exemplified in works of leading contemporary logicians. In "search for firm names" and a better "terminology for knowings and knows," they would jettison all metaphysics and adopt operational definitions.

One of the most significant events of the year was the appearance of "A Symposium on Probability, Part I" (*Philosophy and Phenomenological Research*, vol. 5, no. 4). The first article, "Derivation of Probabilities from Frequencies," by Donald Williams, is a forthright and vigorous attack on the so-called frequency theory of probability, which the other symposiasts stoutly defend. Williams argues that the classic Laplacean formula that the probability of an event is the ratio of the favorable cases to all the possible

cases, favorable and unfavorable, is still "the most general rule for the derivation of probabilities from frequencies." The frequency theory, however, and for very inadequate reasons, according to Williams, insists upon imposing restrictions on the general Laplacean formula. Probability can only be determined, it claims, by the limit of the ratio of favorable and possible cases in an infinite series of trials characterized by randomness or convergence (a "collective").

Although spokesmen for the frequency theory exult in their empiricism, they are soon forced to admit, says Williams, that "an infinite random sequence" is not an empirical fact but a Platonic idealization, that infinite collections hardly ever enter into a probability estimate, except to facilitate statistical calculations, and that "random" cannot even be defined. The bearing of frequency theory upon induction is especially unsatisfactory, since this theory precludes the attribution of a probability to any induction. The frequentists are in a hopeless situation: "Since . . . we cannot know a probability until we know a collective, but cannot know a collective except with probability, the theory debars us forever and *a priori* from knowing any probability whatever." Frequentists such as Venn, Mises, Reichenbach, Nagel and others, Williams shows, frankly admit the skeptical outcome of their theory, and offer no remedy except pragmatic conventions possessing only anthropological warrant. It is this Humean skepticism Williams wishes to avoid by disproving the frequentist's claim that "probabilities can be generated *only* by collectives."

Nagel in the next article of the symposium, "Probability and Non-demonstrative Inference," rejects Williams' criticisms of the frequency theory. If they were correct a great deal of well established physical theory would be invalidated. It is true, he admits, that if probability is defined as a limit, direct empirical confirmation apparently becomes impossible. But the same is true of important theories of natural science which are committed to the use of real numbers. Real numbers are also defined as the limits of infinite sequences. If the frequency theory is unempirical, as Williams claims, so also are those important parts of natural science which employ limits. The frequency theory does not consist of untestable statements, even though pragmatic rules, which the theory does not specify, must be used in applying it to specific cases. Once such pragmatic rules are decided upon, and any theory must employ them, frequency statements can be tested. On other matters Nagel meets Williams half way. He concedes that there is a non-frequency sense of probability, and that when a probability is assigned to a single event it is not always possible to interpret this probability in terms of relative frequency.

The Achilles' Heel of the Laplacean theory is the so-called principle of indifference, which states that when nothing is known concerning two alternatives, or the evidence for them is equal, they are equally probable. This leads to well known paradoxes. Williams does not attempt to defend the principle, but alleges that it is as essential to frequency theory as to his own Laplacean theory, a contention which is rejected by all the other symposiasts—Hans Reichenbach, Rudolf Carnap and Nagel. It will probably be conceded that Williams' defense of Laplace's theory was much less successful than his polemic against the frequency theory. This conclusion becomes even clearer in the second installment of the *Symposium*

which contains papers by Henry Margenau, Gustav Bergmann, R. V. Mises, Felix Kaufmann, and a reply by Williams.

C. W. Churchman in a series of articles on "Probability Theory" (*Philosophy of Science*, vol. 12, no. 3) presents six postulates for experimental method, the last of which is distinctive and interesting. The sixth postulate states: "It is necessary to set up a one-one correspondence between the theoretical elements of the formal theory and the observed points, so that the resulting 'image' of nature provides an adjustment of observations that have been made to any degree of precision." The image of nature is required by experimental method, but it is only permissible "if its principle of adjustment of observations leaves the adjusted observations in control."

Pursuing a similar topic, Carl G. Hempel and Paul Oppenheim ("A Definition of 'Degree of Confirmation,'" *Philosophy of Science*, vol. 12, no. 2) define "degree of confirmation" with the help of R. A. Fisher's principle of "maximum likelihood." The definition reads: $dc(H, E) = pr(H, E, \Delta_r)$, which means roughly that the degree of confirmation of the hypothesis H on the given evidence E is equal to the probability which can be assigned to H after inferring the frequency distribution Δ_r from E . One merit claimed for this definition is that the formal structure of the two sentences H and E is alone sufficient to determine $dc(H, E)$.

One of the above writers, Carl G. Hempel, has also worked out a definition of confirmation ("Studies in the Logic of Confirmation I and II," *Mind*, Vol. LIV, N. S., no. 213 and 214,) employing the notion of the "development" of a hypothesis. The development of the hypothesis that every object has property P or Q , for a finite class consisting (say) of a and b , is a has property P , or Q , and b has property P , or Q . The definition of "direct confirmation" is then: "An observation report B directly confirms a hypothesis H if B entails the development of H for the class of those objects which are mentioned in B ." Confirmation is then defined in terms of direct confirmation. The advantage of this and other definitions offered in these articles, is that they are formulated purely in logical terms, and that the meanings assigned approximate to those employed by science.

V. JERAULD MCGILL.

PHOTOGRAPHIC PROGRESS. The year of victory for the United Nations in the second World War can be divided into two periods. In the first part extending from January through August every effort was being made on the home and the fighting fronts to bring the war to an end. In this drive photography played an important part. During the remaining months comprising the second period, a great inventory and reconversion program was in progress, to catalog the happenings of the war and to supply needed materials for peacetime use.

Photography During the Closing Months of the War. It is difficult at this time to appraise accurately the full value of photography in the war. It was used in so many ways both old and new, and the quantity of equipment, chemicals, and film used so far exceeded normal consumption, that no true picture can be made until all facts are compiled. Probably the best estimate of its usefulness is given by General Marshall's biennial report which appeared in October. It pointed out that the major part of all intelligence data about the enemy was obtained from aerial reconnaissance

photographs. Millions of such photographs were required for each major operation. The plan by the Air Corps to knock out the German synthetic oil plants, aircraft factories, and other strategic points was guided and assessed by photography. The grand strategy of the American, British, and Russian armies, in the final drive to crush German resistance by dividing and isolating its armies, was recorded in detail by cameramen on the ground and from the air. The camera photographed the historic junction of the Russian and American armies near Torgau on the Elbe River on April 25. When the final surrender came in May the signing of the surrender papers was documented by photography; at Luneburg on May 4, at Reims on May 7, and in Berlin on May 8. Then followed the arrest of the leaders, and photographic evidence of their criminal brutality was obtained. Introduction of this evidence assisted in the conviction of many of these individuals during their trials in the fall. Captured German motion pictures were also expected to be introduced as prosecution evidence in some of these trials.

A much similar account was told about the war in the Pacific. Photographic reconnaissance guided the campaign for the release of the Philippines and the invasions of Iwo Jima and Okinawa. A photograph of the raising of the American flag on Mt. Suribachi, on Iwo Jima, taken by Rosenthal of the Associated Press was generally recognized as one of the outstanding pictures of the war. Some of the most amazing motion pictures of the war were made of "kamikaze" attacks on the fleet off Okinawa. Finally in August came the epochal atomic bombing of Hiroshima and Nagasaki. The photographs of these world-shaking events and of the test of the first bomb on July 16 in New Mexico provide valuable records for future study. For this important work 55 cameras were used (mostly motion

picture) with settings varying from $\frac{1}{11,500}$ second at f 32 with density 2 neutral filter, to 2 seconds at f 2, and located at distances from half a mile to 20 miles (*U.S. Camera* 8: 26, Nov., 1945). When the surrender documents were signed on the battleship Missouri on Sept. 2, all phases of this important event were photographed. Again the pattern was repeated as the cameramen recorded the arrest of military and civil leaders, and photographic evidence of treatment of prisoners came from confiscated Japanese films. Through the medium of the newsreel, much of the realism of these events was shared with the people at home.

As the war drew to its close and as a result of partial lifting of military security, information was released concerning such secret devices as radar and rockets (*Life* 18: 26, June 25, 1945; *ibid* 19: 96, August 20, 1945). Radar sends out powerful high-frequency waves and then receives and times the echo from any object in their path; the information usually being recorded as an image on the glowing screen of an oscilloscope much like the screen used in television. The radar "scope" can be photographed and the image then is available for future study. The June issue of the U. S. Army Air Forces magazine, *Impact*, contained the first radar scope photographs to be released publicly. They showed the coast of Normandy before and during the invasion of June 6, 1944, as it appeared on the radar screen in a plane flying above thick clouds. To make such pictures, automatic recording cameras as well as manually operated ones were used.

Much useful data on the flight characteristics of rockets was said to have been obtained from photographs of them taken with high speed cameras. One of these, the ribbon frame camera, was described by Reck (*Bell Laboratories Record* 23: 40 February 1945). The shutter mechanism consists of two concentric drums rotated at slightly different speeds in the same direction. The outer drum turns 24 times per second and has five transverse slots and the inner drum turns 30 times per second and has four slots. The film (a standard No. 122 size) moves continuously behind a slit, 0.15 inch wide, outside the two rotating drums. Exposure times are adjustable from 0.0001 to 0.0006 second, the pictures appearing as narrow "ribbons" across the width of the film, 200 pictures per roll of film.

The Air Technical Service Command in a paper read at the fall meeting of the Society of Motion Picture Engineers in New York supplied further data on high speed photography. Motion pictures of the take-off of a V-1 type rocket bomb, ignition of hydraulic fluids when a fuel line was hit by incendiary bullets, methods of decreasing wear on the tires of a B-29 plane by tire rotation before landing, and the cause of improper firing of machine guns, were some of the subjects discussed.

Propeller efficiency was investigated by photographing airplanes through a wire grid while they were moving on the runway. The pictures were made at a rate of four per second using the grid five feet in front of the camera. Graphs were drawn from the projected motion picture (*Aeronautical Eng.* 4: 159 May, 1945).

The effects of gunfire on armor plate was studied with an electronic sequence timer permitting six microflash lamps to be fired simultaneously or at intervals of 0.6 to 0.0003 second apart (*Phot. Trade News* 9: 39 May, 1945).

Additional fine examples of aerial photography at night were released by the AAF and the RAF for publication. It was also revealed that an Edgerton type gaseous discharge photoflash lamp had been used by the U. S. Army Air Forces for some of this work. Much of the daytime aerial photography was done at altitudes of 35,000 feet or more with automatic cameras fitted with long focus lenses of 24-inch, 40-inch or 60-inch focal length. Haze filters were used to reveal ground detail clearly. A lens of 48-inch focal length was announced by the Eastman Kodak Company in May for use on an aerial camera making 9 by 18-inch pictures. Distortion of the lens from shrinkage in the cold, rare air of the high altitudes was prevented by a thermostatically-controlled electrical heater (*New York Times* 94: 95, May 5, 1945). Some aerial photography was done from high speed planes at very low altitudes, for example over 200-miles per hour at 200 feet above the ground. Although most photographic planes were not equipped with armament protection, it was reported in August that a photo version of the B-29 Superfortress was used over Japan. It was called the F-13-A and was equipped with six cameras. It retained the firepower of the B-29 but carried a lighter bombload (*Skyways* 4: 10, August, 1945). The history of air camera design and the modern requirements of aerial cameras were discussed by Williamson (*Phot. J. (London)* 85B: 50 May-June, 1945).

Throughout the war microfilm was used for many purposes when a saving of space of records, blueprints, documents, and so on was necessary. The original material was copied on 16-mm. or 35-mm. film which could then be wound into a

compact roll and contained in a small box. An interesting example of this work was the method used to speed up the repair of damaged warships of the U. S. Navy. Before the ship started back to the United States, photographs of the damage would be flown to the navy-yard on the west coast. While the ship was en route, the complete set of blue prints would be copied on microfilm from the master set in Washington and the reels of microfilm would then be flown to the west coast navy-yard where the repair was to be made. Enlargements of the damaged sections were made from the films and the sections were then refabricated ready for installation when the ship reached port (*Business Week* 18: 38 June 2, 1945, also *Automotive and Aviation Industries* 91: 98 December 1, 1944).

The photographic work of the Federal Bureau of Investigation was described by Dunlop under the headings of investigation, examination of evidence, arrest, and photography of the suspect, and presentation of the evidence (*J. Phot. Soc. Amer.* 11: 285, September, 1945).

As the year drew to an end, many of the war projects were discontinued. One of these was V-mail, an adaption of the British Airgraph system by which letters were microcopied onto 16-mm. film, 1800 to a 100 foot roll, for transmission by air to their destination where they were enlarged about one-half original size before sending them on to the addressee. Between June, 1942 when V-mail was started in this country and Oct. 31, 1945 when it was stopped, more than 1,250,000,000 pieces were handled. The plan resulted in a space saving of about 98 percent in shipment.

Greatly enlarged pictures of the blood vessels of the eye were made with a new ophthalmic camera which was designed by Wing Commander Pierce, R.C.A.F. A high intensity discharge lamp was used for exposure with a lens operating at f/80 to f/100. The photographs in color were used to study the vitamin deficiency of flying personnel.

The Pacific war provided a great testing ground for checking the resistance of photographic materials, chemicals, and equipment to heat, humidity, insects, bacteria and fungus. Many new methods of tropic packaging were devised during the war and it was expected that some of these packings would be used for peacetime shipment to tropical regions of the world. The packagings included waterproof laminated bags, preservative dips, and rip-strip cans. Two special combat cameras of rugged construction, the Graphic 45 and the Simmon, were introduced during the year. Both models had certain features intended for protection under rigorous field conditions.

The motion picture studios in Hollywood did many things to aid the war effort. Some of this work has been described—such as the preparation of training films for the Army and Navy, the making of short pictures to aid the war bond drives, and the reduction printing of feature motion pictures onto 16-mm. film for entertainment of service men and women at bases throughout the world. Now it can be told that the famous "miniature" departments of the west coast studios were called on to reproduce large sections of the Japanese mainland on a scale of one foot to the mile. One of these "target" areas was 90 by 60 feet; when completed it was photographed with special equipment to simulate the view that would be seen on an actual bomb run. The prints of the picture were rushed to Saipan

to be shown over and over to the B-29 crews who were to bomb Japan (International Photographer 17: 5, November, 1945).

Inventory and Reconversion. During the final months of the war, military demands for photographic materials became so great that it was impossible to fill civilian needs and a recognized shortage of film and paper prevailed. Some idea of the military requirements can be obtained from figures released by one large manufacturer for the year 1944. The equivalent of 300,000,000 rolls (820-size) and sufficient paper to make 7,760,000,000 prints was delivered to the armed forces. Since dealer's stocks were very low at the war's end it was the job of the manufacturer to replenish these as quickly as possible. It was fortunate for both consumer and manufacturer of photographic products that the photographic industry had fewer reconversion problems than many other industries. It was generally expected that by the end of the year much of the amateur and professional stocks of film and paper would be well along toward full replenishment.

Back orders of service men and the needs of the armies of occupation were given preference in the matter of equipment, and it was predicted that domestic dealers would have to wait longer for such items as cameras, enlargers, projectors, etc., than for sensitized materials. One of the largest motion picture plants in Europe, located near Munich, Germany, was taken over in August by the Information Services Control Command of the U. S. Army Forces for the production of documentary and news films. It was understood these would be used for education of the Germans as an antidote for their long dosage of Nazi propaganda (N.Y. Times 94: 18, August 5, 1945).

Reflecting in some measure the tremendous growth in the use of 16-mm. motion picture films during the war, an expansion of the peacetime uses of such film was predicted. A new series of industrial films on "Problems in Supervision," was completed by the U. S. Office of Education (*Business Screen Mag.* 6: 16, no. 2, 1945). Traditionally motion pictures on film 35-mm. wide had been used almost exclusively before the war for entertainment showing in theaters throughout the world. During the war, thousands of prints of feature pictures, newsreels, and shorts were made on 16-mm. film and shown to members of the services. The quality of such prints was very good and it was not surprising, therefore, to learn that a number of firms were planning continued use of 16-mm. film. Loew's International Corporation announced a plan to distribute abroad for showing in rural districts reduction prints of feature pictures and shorts made by Metro-Goldwyn-Mayer (*Mot. Pict. Herald* 160: 29, Aug. 25, 1945).

For use in the rehabilitation of war veterans, a plan was announced for equipping hospital wards with small projectors capable of projecting micro-film images on the ceiling. This equipment was operated with very simple controls by the patient (*Amer. Library Asso. Bull.* 39: 23, January, 1945).

A portrait photographer named Karsh who lived in Ottawa probably made some of the finest character studies of British and American leaders in the war (*Life* 18: 73, Apr. 23, 1945; also *Popular Phot.* 16: 20, May, 1945).

One of the leading photographers of the world, Capt. Edward Steichen, U.S.N.R., was named to the position of Director of the newly created U.S. Navy Photographic Institute. Purposes of the

Institute were to promote and encourage photography of naval subjects, and to make awards for outstanding work by Navy and civilian photographers.

Color Photography. It was generally indicated through increased national advertising and customer's requests to dealers during the latter part of the year that public interest in color processes was growing. Demand for color films had been brisk in the face of a dwindling supply throughout the summer months but the prospect for more materials appeared somewhat brighter toward the end of the year. The great majority of transparencies and 8-mm. and 16-mm. motion pictures were still being made on Kodachrome film as had been true since the introduction of this product ten years previously. It was reported from Rochester in November that the Eastman Kodak Company was starting construction of a new plant to be devoted entirely to processing color film and prints, in anticipation of a need to increase greatly their annual production capacity.

Full details for processing of Ansco Color sheet film and Reversible Printon were published by Bates (*Ansonian* 9: 4, March-April, 1945). Wobbe published a comprehensive article on Gasparcolor Opaque, a multi-layer printing material for making color prints by contact or enlargement from color transparencies. During the processing of this film the dye in all three color layers is bleached out where any silver image exists, and after the silver image is bleached a positive color image is left (*The Camera*, Baltimore, 67: 21, August, 1945).

The first public demonstration of the Kodak Dye Transfer Color Process occurred Sept. 24-25 at the Wisconsin State Photographer's Convention. This is a method of making imbibition prints from sets of dyed matrices prepared from separation negatives. A special apron was used for quick and accurate transfer of the final color images. The method is an improvement over the older Wash-Off Relief process. With the process color prints could be made easily and quite rapidly from 35-mm. or sheet color transparencies.

The Ansco Colorpak Process for professional motion pictures was demonstrated at the Society of Motion Picture Engineers' meeting in New York in October. It is a reversal monopack process of the same type as that used with Ansco Color. A motion picture made by the negative-positive color motion picture process developed by Agfa in Germany during the war was shown in New York in the fall.

A color photograph of the "Big Three" at the Potsdam conference was transmitted by radio by the U.S. Army Signal Corps technicians and Wash-Off Relief prints from the transmitted separations were released for publication. A one-shot camera was used to make the original separation negatives (*The Camera*, Baltimore 67: 75, October 1945).

Time-lapse color motion pictures of whole sky were shown by Condit at the March meeting of the Photographic Society of America in Rochester. To make these unusual pictures he used a Ciné Kodak Special fitted with a motor drive having a set of gears which allowed several different speeds, varying from one to twenty pictures per minute. The camera was focussed on a plane mirror located 30 inches above a convex mirror 12 inches in diameter which reflected the entire sky hemisphere. When the film was projected at normal rate of sixteen pictures per second, cloud movements for an entire day could be seen

in a minute or so. The motion pictures were expected to be of value in connection with weather studies.

A paper on color photography applied to war surgery was published by Hennell who made several thousand sets of separation negatives in British hospitals and in Italy during the war. For this work he preferred a National Photo Color camera and open flash technique, using four flash bulbs with the lens diaphragm set at $f/16$. Prints were made by three color carbonyl (Phot. J. 85A: 144, June, 1945). The choice of suitable colored backgrounds when photographing pathological specimens was shown to have an important effect on the interpretation of the photograph (*Radiography and Clinical Phot.* 20: 34, 1944).

In medical work where accurate reproduction of color is often necessary for diagnosis, Offenhauser pointed out that some of the very common biological stains are not reproduced accurately by 16-mm monopack color films. He presented previously unpublished data on films and filters which had been helpful in solving some of the problems of color duplicating in commercial laboratory work (*J. Soc. Mot. Pict.* 45: 113, August, 1945).

Forest discussed the design and use of an automatic processing machine for Ansco Color 16-mm. motion picture film (*J. Soc. Mot. Pict. Eng.* 45: 313, November, 1945). Practical utilization of a monopack 35-mm. color film was discussed by Clarke who photographed every scene of the full length feature production *Thunderhead—Son of Flicka* for Twentieth Century Fox Films. His paper described the problems encountered, the techniques used and benefits derived (*J. Soc. Mot. Pict. Eng.* 45: 327 November, 1945).

The use of tone correction masks when making separation negatives from Kodachrome transparencies for color reproduction was recommended by Speck (*J. Phot. Soc. Amer.* 11: 461, November, 1945). It was claimed by Yule that it was advantageous to make masks of this type slightly unsharp. (*Phot. J.* 84:321 November, 1944).

The history, chemistry, and characteristics of color coupler development were discussed in a comprehensive article by Tull which included an extensive bibliography (*Phot. J.* 85B: 13, January-February 1945).

Physical Measurement and Standardization. A number of expeditions went to Montana and central Canada to observe and photograph from the ground and from the air the total eclipse of the sun on July 9. Both ordinary and color pictures were taken of the corona. Probably the best results were those obtained by the Royal Canadian Air Force who made direct views of the corona on panchromatic and infrared film at 17,000 feet and photographed the flash spectrum at 26,000 and 33,000 feet. This is believed to be the first time that the flash spectrum has been photographed from an airplane.

A photographic recorder, designated an 'interferograph', was designed by Saunders for the photography of interference phenomena. A strip of 35-mm film is used on which 200 easily readable fringes may be recorded on one meter of film. (*J. of Research*, National Bur. of Standards 35: 157, September, 1945).

Jones and Higgins made an investigation of the relationship between the granularity and graininess of developed photographic materials. They concluded that, "Inasmuch as the ratio of graininess to granularity is not the same function of density for different materials, graininess in general cannot be computed as the product of granularity and

a function of density which is independent of the material." (*J. Opt. Soc. Amer.* 35: 435, July, 1945).

A modified densitometer for reading the integrated densities of processed monopack color films was described by Sweet (*J. Soc. Mot. Pict. Eng.* 44: 419 June, 1945).

A progress report of the work of the American Standards Association War Committee on Photography and Cinematography-Z52 was published by McNair indicating that 25 American War Standards had been approved by October, 1944 and about 40 additional ones were expected to be adopted by April, 1945. (*J. Soc. Mot. Pict. Eng.* 44: 386, May, 1945). Farnham reported that photographic flash lamps were evaluated on the basis of their picture taking ability and a standard method of packaging to withstand transit and other useful details were described in specification Z52.43-1944. New sound quality test standards for 16-mm motion picture prints were published (*Photo Trade News* 9: 29, March, 1945; *ibid* 9: 20, April, 1945).

Laboratory and trade tests of intermittent sprockets on 35-mm motion picture projectors were stated by Talbot to have shown that the adoption of a slightly larger diameter sprocket (0.943 in. as compared with 0.935 in.) will give from 2 to 3 times increase in "wear life" of projected film (*J. Soc. Mot. Pict. Eng.* 45: 78, August, 1945). This change was endorsed by the Subcommittee on Projector Sprocket Design (*ibid* 45: 73, August 1945).

Photographic Apparatus. Manufacturers of equipment began in September to get under way their long deferred plans to resume peacetime building of photographic apparatus. Production was being resumed as rapidly as possible with the available supplies of raw materials and using chiefly tools and designs that had been stored during the war. It was predicted that dealers would have limited stocks for some months to come because backorders of service men and the military requirements of the armies of occupation would get preference.

There was much speculation relative to the type of design that would be chosen for new amateur cameras, articles in some photo dealer publications seemed to favor small twin-lens reflex type cameras. Another suggested type would use 70-mm film. Several firms announced shutters with built-in flash synchronization. Improved lenses were expected as the American optical industry was known to be capable of producing lenses second to none anywhere in the world. The war acted as a great stimulant to an expansion of the optical industry in Australia, according to reports by the U. S. Department of Commerce. Five plants produced 14 types of camera lenses, including one of 36-inch focal length. (*Foreign Commerce Weekly* 19: 23, May 19, 1945).

For color photography on daylight type color film, new blue flash bulbs were announced with which it was claimed improved color pictures could be obtained.

A portable printing and developing machine was described which prints either roll stock or sheets from tracings at a speed up to 6 feet per minute. Illumination is provided by a 2,000-watt mercury vapor lamp. (*Aeronautical Engineering Rev.* 4: 155, May 1945). A new film developing machine featuring special methods of turbulence to insure better uniformity of development was described by Leshing and Ingman (*J. Soc. Mot. Pict. Eng.* 44: 97, February, 1945).

A film strip projector using 16-mm film instead of the conventional 35-mm film was described. With this apparatus, 1,000 slides could be included

on 25-feet of film. An automatic timer restricted the time that each picture was held in the gate to not more than 2 seconds; if it was necessary to retain it longer on the screen, the picture was repeated (*Film World* 1: 15, February, 1945).

A polarized, plastic motion picture screen was devised by Bodde which was claimed to give very uniform illumination over its entire surface. It was claimed to be useful for rear projection work for special process motion picture photography, for television and outdoor advertising (*Plastics* 3: 36, August, 1945).

Brief details were published concerning a camera used during the war for undersea photography at various depths to 225 feet. A domeshaped aluminum pressure case was said to protect the automatic film transport system, wide-angle lens, and synchronized shutter (*Business Week* September 29, 1945, p. 74). Another underwater camera used a transparent Lucite housing which permitted a clear view of all dials by the user (*Film World* 1: 133, May, 1945).

The Photographic Process. Amateur and professional alike were being encouraged to purchase package chemicals which were made available in sizes to make up different volumes of solution from a few ounces to as much as a hundred gallons. The convenience, accuracy, and simplicity of chemicals in this form seemed to appeal to the user. Some of the newer developers had very descriptive names such as Dektol, Microdol, Selectol, and so on. When preparing developers with hard water, calcium salts occasionally are precipitated. Henn and Crabtree studied this problem and recommended the addition of sodium tetraphosphate to a developer for the prevention of calcium sludge formation (*J. Soc. Mot. Pict. Eng.* 43: 426 December, 1944). Photoengravers use developers containing formaldehyde and hydroquinone for halftone images of very high contrast. The properties of such developers was investigated by Yule (*J. Franklin Institute* 239: 221, March, 1945). The catalytic mechanism of development, filament growth during development, and the Gurney-Mott hypothesis of latent image formation were discussed in an elementary account published by James (*J. Phot. Soc. Amer.* 11: 73, February, 1945).

Various ways of using urea in photographic developers were discussed by Dersch as a means of obtaining increased developing speed, for reviving partially exhausted developers, and for developing at temperatures as low as 40° F. (*J. Phot. Soc. Amer.* 11: 467, November, 1945).

The use of a polarograph in the analysis of photographic baths for aluminum alum, chrome alum, and sulfite was described by Shaner and Sparks (*J. Soc. Mot. Pict. Eng.* 45: 20, July, 1945). An improved type intensifier containing quinone, thiosulfuric acid compounds, a strong acid, and an oxidizing agent was worked out by Muehler and Crabtree for use with underexposed or excessively thin negatives. (*J. Phot. Soc. Amer.* 11: 81, February, 1945 et seq.).

Bibliography. Two new photographic publications appeared: *Film World*, a non-theatrical film magazine devoted to uses of 16-mm. film and published by Ver Halen Publications, Hollywood, California; and *Film News* which covers world wide news of documentary and educational motion pictures. It is published by the American Film Center, New York.

Noteworthy books published during the year are as follows:

1. *History of Photography*. J. M. Eder, Colum-

bia University Press, New York. This is a translation by E. Epstein of Dr. Eder's important work, *Geschichte der Photographie* (4th ed. 1932).

2. *Photography*. 2 vols. U. S. Navy, Superintendent of Documents, Government Printing Office, Washington, D. C.

3. *Practical and Theoretical Photography*. J. M. Blair, I. Pitman, New York, 2nd ed.

4. *British Photographers*. C. Beaton, W. Collins, Glasgow.

5. *Nature and Camera*. O. G. Pike, Focal Press, London.

6. *Practical Optics*. B. K. Johnson, Hatton Press, London.

7. *Photography as a Career*. A. Krasznak-Krausz, Focal Press, London.

8. *Encyclopedia of Sound Motion Pictures*. J. R. Cameron, Cameron Publishing Company, Woodmont, Conn. 5th ed.

9. *Photographing in Engineering*. C. H. S. Tupholme, Faber and Faber Ltd. and the Hyperion Press, Ltd., London.

10. *The Art of Photographing Children*. Frank and Molly Partington, Fountain Press, London.

11. *The Use of Photographs in Layout*. H. F. Kraus, MSR Publishers, New York.

12. *Photography and Platemaking for Lithography*. I. H. Sayre, Lithographic Textbook Publishing Co., Chicago, 2d ed.

13. *La Technique Photographique*. L. P. Clue, P. Montel, Paris, 3d ed.

14. *Sensitometrie des films Sonores*, A. Lovichi, A. Lahure, Paris.

15. *Physik und Technik des Tonfilms*, H. Lichte and A. Narath, S. Hirzel, Leipzig, 2d ed. Lith. and printed by Edwards Brothers, Ann Arbor, Mich.

GLENN E. MATTHEWS.

PHYSICS. Atomic Energy. The atomic bomb development and the practical release of atomic energy which culminated in 1945 was the most extensive and expensive scientific research project in the world's history. Begun on a large scale in 1940 it was a war secret undertaking until the first bomb was dropped upon Japan on Aug. 6, 1945. Its cost was \$2,000,000,000.

Historic dates in science's achievement of atomic power have been added to human chronology: Dec. 2, 1942, when the first self-maintaining nuclear chain reaction was initiated in an uranium-graphite pile at Stagg Field Stadium, Chicago; July 16, 1945, 5:30 A.M. when the first atomic explosion created by man blasted the New Mexico desert; Aug. 6, 1945, when the first atomic bomb used in warfare was dropped on Hiroshima, Japan.

The immediate start of the researches which resulted so spectacularly was in January, 1939, when two Germans, Otto Hahn (awarded the 1944 Chemistry Nobel prize in 1945) and F. Strassmann proved that an isotope of barium was produced by neutron bombardment of uranium, the neutron being a fundamental particle of matter without electrical charge and with a mass about equal to that of the proton or nucleus of the hydrogen atom. Two refugees from Germany, O. R. Frisch and Lise Meitner, suggested that the absorption of a neutron by a uranium nucleus sometimes caused that nucleus to split into approximately equal parts with the conversion of some of the mass, by Einstein's 1905 formulation, into enormous quantities of energy, a process called fission. These reports were discussed on Jan. 26, 1939, at a conference on theoretical physics at Washington, D.C., jointly sponsored by the George Washington University and the Carnegie Institution of Wash-

ington, with Niels Bohr of Denmark, Enrico Fermi and others discussing the problem. Experimental confirmation of uranium fission in several laboratories followed, and the suggested likelihood of emission of neutrons in the process was demonstrated. This indicated the possibility of a chain reaction releasing energy explosively, the neutrons produced splitting asunder other uranium atoms and producing more neutrons as well as energy.

By June, 1940, just after the fall of France, when scientists voluntarily restricted publication of papers on the subject of uranium fission in scientific journals, it was known that slow neutrons caused fission in one isotope, uranium 235, but not in the other, uranium 238. It was known that the average number of neutrons emitted per fission was between one and three. A chain reaction had not been achieved but its possibility was clear.

What happened after the curtain of war secrecy was lowered was not revealed until Aug. 10, 1945, when the War Department released as a part of its atomic bomb explanation the now famous Smyth report, a semi-technical report on the processes by which the use of atomic energy for military purposes had been achieved. It was written by Dr. H. D. Smyth of Princeton at the request of Maj. Gen. L. R. Groves, U.S. Army, who headed the "Manhattan Project" as the Army called the atomic bomb project during the war. It is available as a government document from the Superintendent of Documents, Washington, D.C. at 35 cents. Practically all the technical and scientific data about the atomic bomb that can be published without violation of security regulations are contained in this report.

Research on U-235 fission, using heavy water (D_2O) as the moderator, slowing down the neutrons, was under way in both England and Germany in 1939. American scientists substituted specially purified graphite for heavy water.

In order to make the fission reaction in U-235 self-sustaining, it was found necessary to separate U-235 (less than $\frac{1}{2}\%$ in any uranium sample) from the more abundant isotope U-238 (more than 99%). The more common kind prevents the chain reaction, by absorbing neutrons.

An enormous isotope separation plant, using gaseous diffusion methods, was erected at Oak Ridge, Tenn. Much of the experimental work for the whole project was done there.

Two new elements, heavier than uranium 92, both of which were made to order and neither of which were known to exist in nature, played an important part in the atomic bomb researches and manufacture. These were elements 93 and 94.

Formation of element 94 from uranium 238 by neutron capture was effected in the Radiation Laboratory of the University of California in 1941. The new element was found to undergo slow neutron fission like uranium 235. It was named plutonium (Pu).

Plutonium, radio-active but approximately as stable as radium, was obtained from uranium 238, element 92, by way of the intermediate shortlived element 93, named Neptunium (Np) discovered in 1940. Known isotopes of the new elements announced are: 93 Np 237, 93 Np 238, 93 Np 239, 94 Pu 238, 94 Pu 239. Uranium 238 changes to neptunium and neptunium to plutonium by beta-ray transformation. Plutonium emits an alpha ray and slowly changes back into U-235.

Manufacture of plutonium from U-238 allowed utilization of the inert uranium isotope for atomic power purposes. It allowed the advantage of sharp chemical separation of different elements instead

of the tedious diffusion methods of isotope separation.

In the course of the researches it was also possible to make for the first time two heavier trans-uranium elements, numbers 95 and 96, by bombardment with high-energy helium nuclei or alpha particles.

Production of materials for atomic bombs was at first planned to be located at the Clinton Engineer Works at Oak Ridge in the Tennessee Valley. Later the plant for full scale manufacture of plutonium was built at Hanford, Wash., and the bomb laboratory was located at Los Alamos, N.M.

The organization of the atomic bomb project was at first under the Office of Scientific Research and Development. During 1942 and the spring of 1943, control was gradually shifted to the Army, and in May, 1943, the Army Engineer Corps took over.

At the peak of the atomic bomb project construction 125,000 were employed and at the end of the war, 65,000. Among them were several thousand scientists and engineers, including the leading atomic scientists of this country and Allied nations.

Peacetime utilization of atomic energy is considered practical if safeguards are developed and further developments are made. The nuclear reactions producing energy can be produced at a slow, non-explosive rate and, at the cost of uranium in comparison with coal and oil, should eventually be economical for power use, especially in locations that do not have supplies of fuel or hydroelectric power.

There are, however, two major difficulties: The nuclear reaction gives off large quantities of powerful radiation that are extremely poisonous or damaging to human life. This means that a uranium power plant needs to be surrounded by great masses of concrete and metal to confine these radiations. The power-production entails the production of material that can be used in the making of atomic bombs for war and thus every peaceful atomic power plant is an atomic bomb factory if this material is used that way. For that reason international control of the atomic bomb may make necessary the foregoing of the use of atomic power.

Due to the shielding of the atomic power plants and their great weight, it is doubtful if they can be used to propel automobiles or airplanes, or for relatively small power plants. They may be adapted to use in large ships, however.

American industry and science can begin reaping the benefits of large-scale atom-splitting, without having to wait for the development of atomic power. These benefits will flow from the new engineering principles, new equipment and new methods which had to be used under the forced draft of war to produce the atomic bomb in time for use as a weapon.

In addition to hastening the unconditional surrender of the Japanese, the atomic bomb has presented the world with its largest problem in international relations. Due to its destructiveness and small size, the atomic bomb carried to its destination by jet or rocket planes is a weapon of attack for which no adequate counter measure is apparent. World cooperation seems to be the only effective defense against the atomic bomb.

Nobel Prize. Prof. Wolfgang Pauli, now visiting professor at the Institute of Advanced Studies at Princeton, N. J., was awarded the 1945 physics Nobel prize. He was born in Vienna, studied at Munich and until 1940 was at the Technical College in Zurich, Switzerland. His theoretical studies on atomic structure have contributed to advances

in physics, among them the release of atomic energy. He is best known for the exclusion principle that bears his name.

Radar. Although the development and use of radar had been revealed during the war, it was not until after the end of the war that many details were made known.

The small tube used in radar may develop as much as hundreds of thousands of watts. The power must be applied in a burst for only a millionth of a second and then turned off completely to wait in repose for the echo to come back. Development of this oscillator tube was a major achievement.

The receiver, sensitive enough to pick up the tiny echo bounced off a distant ship or plane, must be protected against the terrific power burst of the transmitter, which would paralyze it or burn it out completely.

Transmitter and receiver are built in one box and operate on one antenna. This is really necessary because the directional antenna acts as a "searchlight" sending the signal out and as a "telescope" in picking up the echo. Naturally, both searchlight and telescope must be aimed in the same direction. This is sure when one antenna is used for both purposes.

But use of one antenna requires that the receiver be disconnected when the antenna is sending out the burst of power. The means for doing this was a particularly difficult piece of development, details of which are still not revealed.

Not only is it necessary to disconnect the receiver while the transmitter is working, but within a millionth of a second the receiver must be open to receive the faint echo and the transmitter must be closed off so that it will not absorb any of the weak incoming energy.

To carry the energy from the radar transmitter to the antenna, ordinary wire and coaxial cables are unsatisfactory. For the microwaves used in radar, it is more efficient to use wave guides, which are really carefully proportioned hollow pipes known to radar men as "plumbing." For certain of the equipment these wave guides may look like rectangular rainpouts. The high frequency currents from the transmitter are converted into electromagnetic radiation at the end of the pipe and guided through the pipe by successive reflections from the inside surface.

The antenna design had to be highly directional. This can be done either by building it up of an array of small antennas, or by using the searchlight principle of spraying the energy into a large parabolic mirror which focusses the energy into a beam. In either case, the larger the antenna, the sharper the beam, but it could be made small enough to go on an airplane.

To use the radar to search the whole expanse of sea and sky, the antenna is turned—swung around or up and down to direct the beam in the various directions.

What the radar picks up is shown to the operator on a television-type screen. In the simplest type, an electrical mechanism causes a spot of light to trace a line across the screen at a uniform speed. The spot starts at one side at the instant the transmitter goes off. Whenever an echo comes in, the spot gives an upward bounce or "pip." The distance of this pip from the starting point gives the time required for the echo to return and therefore the distance of the ship or other target.

A target 1,000 yards from the radar will give a pip only six millionths of a second later than the transmitted pulse.

It is possible to set up the radar system to see in all directions on one screen, with any ships and the shoreline appearing as in a map, the radar operator and his ship in the center. This is done by rotating the whole antenna system from one to 20 times a minute, scanning the entire horizon.

In this case, the dot of light starts from the center and moves outward in a direction corresponding to the direction of the antenna. Each echo, instead of making a pip, makes a bright spot of light, indicating both the direction and the distance of the ship that reflected it. The screen thus is an accurate map showing the positions of all the surrounding ships. The radar operator can, in fact, watch the shells move across the screen toward the target pip, and can even see the splashes they make when they hit the water.

Anti-radar. When the Allied radar jamming system was first sprung on the Germans in 1943, it threw their defenses into utter confusion and decreased by 75% the effectiveness of their anti-aircraft guns. In the last days of the wars, both in Europe and the Pacific, the Allied anti-radar devices had made such a boomerang of German and Japanese radar that they often gave up using radar lest it betray them.

Anti-radar devices made public in 1945 were of two general types: aluminum foil called "window" or "shaff," and electronic detectors and jammers. The use of the foil became known to many during the war, but the extent of its use was revealed only afterwards. Approximately 20,000,000 pounds of aluminum foil was dropped in Europe alone. Cigarettes and candy bars in the United States were without aluminum wrappings because the entire production of foil was needed for window.

Aluminum foil is an excellent radio reflector and it returns a relatively strong radar echo in proportion to its size. What made it particularly valuable as window, however, was a discovery made by the scientists that its effectiveness is greatly increased when the strips were cut to one-half the radar's wavelength. These "tuned" strips send back a very strong echo.

The thin strips of aluminum used are only a tiny fraction of an inch wide and a few inches long. A bundle of 6,000 strips weighs six ounces. A single bundle dropped from a plane, scattering in the air, looks to a radar like three heavy bombers. In one test the scope of a radar was watched while this electronic "smoke screen," or window trail, was distributed by three planes. Following planes in the trail failed to record on the scope, even a half-hour later.

Electronic jammers operate on the simple principle of radio interference, similar to the interference with which most home radio users are familiar when they receive two broadcasts from two stations on the same wavelength. The jammers attacked enemy radar receivers with radio waves from planes modulated by random "noise," which drowned out any audible radio echoes from the radar's target and obliterated all signs of the target from the radar's screen, or scope.

A radar can be jammed only by waves of the same wavelength or frequency. A basic instrument in radar countermeasures is an electronic detector called the "search receiver" which can be tuned to intercept a radar signal and determine its frequency.

When equipped with directional antenna, this receiver can locate an enemy radar set. These direction-finding receivers have a much greater range than radar itself, and for this reason often

proved better than radar for locating the enemy. A radar-hunting operator could locate an enemy radar station long before the radar could locate him.

Proximity Fuze. The proximity fuze is a tiny radio set device in the nose of a projectile. Its use in antiaircraft fire directed at Jap suicide bombers, in artillery barrages in the famous Battle of the Bulge in France, and in neutralizing Nazi buzz bomb attacks on London, is credited as a major help in winning both the European and Pacific wars.

The VT, or variable time fuze, explodes a projectile as soon as it comes close enough to a target to inflict damage.

For two and a half years of war, projectiles and bombs fuzed with this proximity device inflicted terrific damage on the enemy. The only clue to its existence was what appeared to be unprecedented accuracy of gunfire; it caused devastating destruction in spite of slight unavoidable inaccuracies in aim.

The VT fuze is an extremely rugged five-tube radio sending and receiving station which fits into the nose of a projectile. The heart of this miniature radio station is a vacuum tube which sends out electro-magnetic waves or impulses. The impulses are reflected back to the tube by any target that gives a radio reflection, such as metal objects, water or earth.

Sono-Radio Buoys. Sono-radio buoys located Nazi submarines under the waters of the Atlantic and guided Allied destroyers to the spot for the kill.

Visual and radar sighting served well as long as the enemy U-boats stayed on the surface but were of no value when the subs remained under water. The sono-radio buoy gave the airplane ears to hear, locate, and to follow a submerged U-boat.

The warned airplane could itself attack or call destroyers to the spot.

By relaying subsurface noises to the plane, the sono-radio buoy also made it possible to know the outcome of the attack. Sometimes the propeller beat of the U-boat as it fled the scene could be heard. Sometimes ominous breakup noises followed by silence testified to the death of the sub.

There was developed a sono-radio buoy light enough to be carried in quantities by airplanes, cheap enough to be expendable, and rugged enough to withstand the shock of water entry. In addition it had battery-power sufficient for several hours' life, and adequate acoustic and radio range.

The floating sono-radio buoy picks up the sounds of a submerged U-boat by hydrophones which change the sound waves in the water into small electrical voltages that are amplified and converted into radio waves in the transmitter part of the buoy. Airplanes carried receivers tuned to the same frequency of the buoy transmitters.

Loran. Ships and planes plying the international air and sea lanes can locate their positions accurately to within a few thousand feet by means of the "loran" navigation system developed and constructed during the war.

Loran consists of a vast network of radio stations which in effect spread into space an electric stop watch accurate to a millionth of a second. By means of a little box, which aboard airplanes weighs only 35 pounds and should cost about \$500 in peacetime production, dancing green lines on a cathode ray tube read by the navigator allow him to place the location of his craft with as great accuracy as is provided by celestial navigation based on shooting the stars or the sun with a sextant.

First put into actual operation late in 1942, loran

was one of the secret weapons in fighting German submarines in the Atlantic. Later, as the war was carried to other parts of the globe, loran went to the fighting fronts in the air and on the sea with its radio impulses extending over enemy-held territory in order that bombers and ships alike might navigate safely. At the end of the war 70 loran stations sprayed their signals over three-tenths of the earth's surface. A total of 90,000 loran receiving boxes were ordered for war use on ships and aircraft.

Loran is not radar, but it does use radio. By comparing two radio signals from stations separated by about 400 miles, a navigator can locate exactly the position of the craft on the sea or in the air. Simple charts or tables are used.

The determination of position is based upon very accurate measurement of the difference in the time of arrival of signals from two radio stations operating on a frequency just above the broadcast band. The part of the radio spectrum used is that formerly used by amateurs. Signals of the two transmitting stations are precisely synchronized.

The loran receiver determines with great accuracy the difference in the time at which the two signals from the loran transmitting stations are received. Curves are printed on a navigation chart showing the loran lines of position for various time differences. These sweep around the transmitting station's location in the form of hyperbolas. Since the areas of frequent travel by ships and planes are blanketed by the loran signals from several transmitters, the navigator can determine three or four or more such lines of position. Where these lines cross gives the point known as a "fix," which represents on the navigating chart just where the craft is located.

Loran gets its name from the fact that it is a long range aid to navigation (*lo* from long, *r* from range, *a* from aid, and *n* from navigation).

In the daytime loran can be relied upon for 700 miles from the transmitting station, while at night, thanks to the reflection of the signals in the 160-meter band by the ionosphere, reliable determination of position can be made at twice the maximum daytime range of the transmitters.

Television. Extreme sensitivity is the striking feature of a new television "eye." This television camera tube is so sensitive that it can pick up scenes illuminated only by candle or match light, or scenes with invisible infrared rays in a blacked-out room. The Image Orthicon resembles a large tubular flashlight in size and shape. It is about 15 inches long, with a shank about two inches in diameter, and a head three inches in diameter and three inches long. It has three main parts: an electron image section, an improved Orthicon-type scanning section, and an electron multiplier section in which the relatively weak video signals are magnified before transmission.

The principle on which the tube is based is known as secondary electronic emission. This involves the use of electrons from a primary source as missiles to bombard a target, or a series of targets, from each of which two or more electrons are emitted for each electron striking it. The primary source in the tube is a photo-sensitive face on which the light from the scene being televised is focused by an optical lens system.

Bibliography. Among the new books on physics issued in 1945 were: P. Auger, *What are Cosmic Rays?* (Univ. of Chicago Press); *Radar: An Official History of the New Science With Technical Descriptions and Glossary of Radar Terms* (British

Information Services); R. H. Carleton, *Vitalized Physics in Graphiccolor* (College Entrance Bk. Co.); B. C. Dees, *Fundamentals of Physics and Their Applications in Modern Life* (Blakiston); D. Dietz, *Atomic Energy in the Coming Era* (Dodd); G. G. Hawley, *Atomic Energy in War and Peace* (Reinhold); C. Herzberg, *Infrared and Raman Spectra of Polyatomic Molecules* (Van Nostrand); R. G. Hudson, *An Introduction to Electronics* (Macmillan); W. C. Johnston, *Mathematical and Physical Principles of Engineering Analysis* (McGraw); J. H. Keenan and J. Kaye, *Thermodynamic Properties of Air Including Polytropic Functions* (Wiley); W. P. King, *Fundamentals of Electromagnetic Engineering* (McGraw); J. J. O'Neill, *Almighty Atom: The Real Story of Atomic Energy* (Washburn); G. E. Pendray, *The Coming Age of Rocket Power* (Harper); *The Atomic Age Opens* (Pocket Books); S. Ramo, *Introduction to Microwaves* (McGraw); H. Semat, *Fundamentals of Physics* (Farrar); H. D. Smyth, *Atomic Energy for Military Purposes* (Princeton Univ. Press); W. F. C. Swann, *The Nature of Cosmic Rays* (Sky Publ. Corp.); *Radar: A Report on Science at War* (Supt. of Doc.); H. L. Williams, *The Fundamentals of Electronics and Their Applications in Modern Life* (Blakiston); R. R. Wright, *Electronics Laboratory Manual* (McGraw).

WATSON DAVIS.

PITCAIRN ISLAND. An island in the South Pacific, approximately midway between South America and Australia. Area: 2 square miles. Population (June 30, 1943): 177. The island was originally settled in 1790 by mutineers from H.M.S. *Bounty* and native men and women from Tahiti. In 1902 the islands of Ducie, Henderson, and Oeno were annexed by Great Britain and are now included in the district of Pitcairn. The agricultural products are yams, taro, maize, sweet potatoes, bananas, pumpkins, oranges, melons, pineapples, arrowroot, sugar, and coffee. The Government is administered by an annually elected council of 5 members headed by a Chief Magistrate subject to the control of the British High Commissioner for the Western Pacific. Chief Magistrate: F. M. Christian.

PLANT INDUSTRY, SOILS, AND AGRICULTURAL ENGINEERING, Bureau of. A Bureau of the U.S. Department of Agriculture, created as the Bureau of Plant Industry in 1902. Activities include investigations of plant production and improvements of soils in which they are grown and the engineering problems concerned with farming. During 1945 most of the Bureau's activities were focused on experimental work in Central and South America to establish commercial rubber production in the Western Hemisphere. Headquarters: Plant Industry Station, Beltsville, Md. Chief: Robert M. Salter.

PLASTICS. During 1945 the plastics industry, still emerging from its pioneering stages, realized many of its potentialities.

Because of war needs, experimentation and development of new plastics were forsaken in favor of undivided production of military materials. Late in the year, however, cellulose propionate, which seriously competes with other cellulosic plastics used for molded products, sheets, and films, was produced on a commercial scale. According to Dr. Gordon M. Kline in the January, 1946, issue of *Modern Plastics*, this material achieves better dimensional stability than cellulose acetate plastic by virtue of greater inherent plasticity and lower moisture sensitivity.

The end of the war made available the details of important industrial developments in German plastics during the war years. One report from an Allied technical team in Germany revealed plastics not manufactured in the United States and another report disclosed new manufacturing processes.

Among its secret war duties plastics were used in the artillery proximity fuse, rockets, M-47 incendiary bombs, armor for vests, and curtains to provide protection against flak, the T-44 frangible bullet, and the No. 77 grenade. Plastics were further used in radomes for radar, insulation on radio equipment, ogives for navy projectiles, impregnation of map paper to produce high-wet strength paper, machete sheaths, desalter bags and melamine trays and tableware.

The versatility of plastics was aptly displayed in the aircraft industry. In addition to their use in the development of materials for structural purposes, plastics achieved increasing utility in gliders, helicopters, small airplanes, air ducts, interior decoration, hydraulic systems, propeller equipment and forming dies.

Mr. W. I. Beach received the John Wesley Hyatt Award for 1944 for his work on the postforming of laminates which provided critically needed parts for the aircraft industry with savings in man-hours, weight, and costs.

Dr. Kline pointed out a trend to resin-bonded plywood in small boat construction and the use of large quantities of this material to alleviate housing shortages.

Plastics continued to fortify its position in numerous industries and professions. In the textile industries, many processes were being modified because of the use of plastics for synthetic fibers, impregnation and surface treatment of fibers and film coatings on fabrics. The shoe industry absorbed millions of pairs of plastic soles. The packaging industry investigated the war-developed plastic films for civilian uses. In the medical profession plastics grew more important in instruments, prostheses, and gauzes.

Ion-exchange resins were used more extensively in the purification of food, recovery of metals, and manufacture of drugs. Outstanding use of plastics was made in resin-bonded magnets, tank linings, compasses, brake linings, signs, luminescent fixtures and dials, irrigation piping, bottles, battery separators and resin-bonded sand cores for foundry use.

Increasing consumer demands stressed the important functions of resin in providing an efficient means for attaching wood, metals, plastic, glass and other materials into composite structures.

In the field of molding and fabricating of plastics, strides were made in the technique of low-pressure molding, in the process of electronic heating as an adjunct to compression molding, in the attaching of laminates together without marring the surfaces and in a simplified method for applying calibration scales and dial faces to precision instruments.

The once-secret manufacture of lenses, containing polystyrene and cyclohexyl methacrylate, for military cameras and sighting instruments was viewed as a significant advance in the development of improved transparent plastics for optical uses.

In his article in *Modern Plastics*, Dr. Kline mentions the varied uses of silicone polymers and its derivatives in the rubber gaskets on searchlights; in the turbo-superchargers on B-29 bombers; in the enamels for baked coatings on heating units; and in the water repellent treatment of textiles, mirrors, windshields, and wallpaper.

POLAND. A central European republic, established Nov. 9, 1918. It was invaded by Germany Sept. 1, 1939, partitioned between Germany and the U.S.S.R. by the treaty of Sept. 28, 1939, and completely occupied by German forces after the outbreak of the Russo-German war on June 22, 1941. The liberation of Poland, begun early in 1944, was completed in the spring of 1945 (see **EVENTS**, below). For details of the partition, German rule in Poland, and the Polish Government-in-exile, see **YEAR BOOK** for 1944, p. 480.

Area and Population. The territorial limits of the new Poland have not yet been finally drawn and no precise figures are available on its area and population. A blueprint of Poland's future boundaries was provided by the decisions of the Potsdam (Berlin) Conference of July 17-Aug. 2, 1945, which placed under Polish administration all German territories east of the Oder and (Western) Neisse rivers, with the exception of a portion of East Prussia. Previously, it had been agreed at the Crimea (Yalta) Conference that Poland's eastern boundary should run along the Curzon Line. The area of Poland within these provisional new boundaries is estimated at 120,782 square miles, with a population of between 23 and 24 millions. For details, see **EVENTS**, below.

Government. Political and social conditions in Poland are in flux. A new Constitution has not yet been drawn up. By and large, however, the original Constitution of the Polish Republic of 1921 has been revived and the semi-dictatorial Constitution, introduced by Pilsudski in 1935, has been discarded by the Polish Provisional Government of National Unity set up on June 28, 1945. Pending the general election which this government is pledged to hold at the earliest possible moment, the Home National Council serves as interim parliament. The Council's 7-man presidency, headed by Boleslaw Berut, exercises the prerogatives of the President of the republic, whose position is vacant. Premier, Edward Osobka-Morawski.

Production. The first statistical data released by the Provisional Government give an incomplete but nevertheless interesting picture of Poland's economic recovery. The coal output rose steadily in 1945, from 1,355,621 tons in May to 3,114,297 tons in November. In the textile industry, the production of wool and cotton fabrics increased from 2,658,663 meters in March to 10,427,663 meters in October. In September, 1,580 tons of cellulose and 8,732 tons of paper were produced, as compared with 195 and 212 tons, respectively, in April. Crops were harvested from 5,948,567 hectares. The production of sugar beets in 1945 was estimated at 500,000 tons. Poland's prewar livestock was drastically reduced under the German occupation, with only 25 percent of the cattle and 35 percent of the horses left.

Education. A school reform introduced by the Provisional Government provides for free, compulsory education for 12 years, including university courses. Poland in 1945 had 29,886 schools. Universities have been re-opened at Warsaw, Cracow, Lublin, Poznan, Lodz and Torun.

Events, 1945. Poland at last rejoined the comity of nations with a new government, a new set of frontiers, new policies, and a new constitution in the making. The conditions for this national revival were created, and its pace was set, by the mighty Soviet offensive on the Eastern Front which began on Jan. 12 and in a few weeks broke the back of German resistance. Poland's capital, Warsaw, was retaken on Jan. 17. By the end of March virtually all of prewar Poland had been liberated.

Toward Recognition. Immediately after the fall of Warsaw, the Polish Provisional Government of Lublin, then recognized only by the Soviet Union, moved into the devastated capital, thus gaining another point in its bid for universal acceptance. In London, the Government-in-exile continued to function with at least the tacit support of the United States and Great Britain. With every new mile of Polish territory liberated by the Russian and Polish armies, the problem of the two rival governments, one in Warsaw, the other in London, became more pressing and unavoidable.

The tangled Polish situation was one of the principal issues facing Roosevelt, Churchill, and Stalin at their Crimean Conference (Feb. 4-11). Although it was not completely unravelled at Yalta, the problem there was brought considerably nearer to an all-around satisfactory solution.

The Yalta Declaration, reaffirming the Big Three's desire "to see created a strong, free, independent and democratic Poland," stated: "The Provisional Government which is now functioning in Poland should therefore be reorganized on a broader democratic basis with the inclusion of democratic leaders from Poland itself and from Poles abroad. This new government should then be called the Polish Provisional Government of National Unity." To effect this change, the three heads of government set up a tripartite commission empowered to consult and negotiate with the various Polish factions.

On the equally controversial question of Poland's future boundaries the three statesmen agreed "that the eastern frontier of Poland should follow the Curzon Line, with digressions from it in some regions of five to eight kilometers in favor of Poland. They recognize that Poland must receive substantial accessions of territory in the north and west. They feel that the opinion of the new Polish Provisional Government of National Unity should be sought in due course on the extent of these accessions and that thereafter the final delimitation of the western frontier of Poland should be postponed until the peace conference."

This agreement doomed the intransigent Polish Government-in-exile, which had flatly rejected the revision of boundaries demanded by Russia and had shown little desire to come to terms with the de facto regime functioning in the homeland. Premier Tomasz Arciszewski of the London Polish Government promptly denounced the Crimean agreement, but his protests were ignored by all other parties concerned. By contrast, former Premier Stanislaw Mikolajczyk, most important of the "democratic leaders" among the Poles abroad who were to be consulted on a new government, on April 15 unequivocally adhered to the decisions of Yalta.

Despite this declaration, and the strenuous spade-work of the inter-Allied commission, the unity talks made only slow progress. At one time they were even threatened with a complete breakdown that might have had incalculable consequences. That crisis arose on May 3 when Soviet Foreign Commissar Molotov, during the San Francisco Conference, admitted that sixteen Polish underground leaders had been arrested by the Russians on charges of "diversionist activity" behind the Red Army lines. The disappearance of these Poles, some of whom had been considered for inclusion into the Government of National Unity, had previously been announced by the Arciszewski regime.

Another disturbing element was Russia's dissatisfaction at the refusal of the United States and Great Britain to invite the unrecognized Warsaw

Government to the San Francisco Conference. As in challenge to this attitude of its western allies, Moscow on April 21 concluded a treaty of friendship and mutual assistance with the Warsaw regime. The treaty was negotiated in Moscow by President Boleslaw Bierut and Premier Edward Osobka-Morawski of the Provisional Government.

Government of National Unity. All these differences notwithstanding, the talks aimed at the creation of a new Polish Government, in accordance with the Yalta formula, continued. A great stride forward was taken when President Truman in May sent Harry Hopkins to Moscow as his special emissary; Mr. Hopkins on June 8 concluded a thirteen-day conference on the Polish problem with Stalin and other Soviet officials.

As a direct result of Mr. Hopkins' patient efforts, the tripartite commission set up at Yalta on June 12 issued invitations to the leaders of the various Polish groups to come to Moscow for consultations on a new government. Scheduled to open on June 15, the conference was slightly delayed by the illness of Wincenty Witos, aged peasant leader, who figured prominently among the "democratic leaders from Poland," mentioned by the Yalta Declaration. A substitute eventually had to be chosen for Mr. Witos, who died a few months later. For the London Poles, Mr. Mikolajczyk attended, accompanied by the Socialist miners' leader, Jan Stanczyk.

The Moscow Conference of the Poles at long last produced the result all the world had been anxiously waiting for: the Polish Provisional Government of National Unity envisioned at Yalta became a reality. On June 23 it was officially announced that the conferees had reached a full understanding on the composition of the new government. A preliminary step was to enlarge the Presidium of the National Council of Poland (hitherto held by Bierut) by the inclusion of Mr. Witos and of Professor Stanislaw Grabski of the London Poles; in this body are vested most of the powers formerly exercised by the President of the Polish Republic.

In accordance with these decisions, the Warsaw Provisional Government resigned on June 28 and was replaced by the Government of National Unity. Osobka-Morawski continued as Premier. Mikolajczyk became one of two Vice Premiers (the other being Wladyslaw Gomolka of the Warsaw group) and also was appointed Minister of Agriculture. Stanczyk was named Minister of Labor. The leader of the Polish troops that had fought their way back into the homeland alongside the Red Army, Marshal Michal Rola-Zymierski, was appointed Minister of War. The Foreign Ministry went to Wincenty Rzymowski. While the balance of power in the new Cabinet unquestionably remained with the Soviet-sponsored Warsaw group,—only five out of 21 posts were reserved to London Poles or to their sympathizers within Poland—Allied diplomats felt that as much had been achieved as could reasonably be hoped for.

Trial in Moscow. The success of the Polish Conference in Moscow was the more remarkable as it coincided with the trial, in the same city, of the sixteen Polish underground leaders arrested by the Red Army (see above). Pessimists freely predicted that the Russians' refusal to release the Poles would cause a new deadlock in the unification talks. That these misgivings proved groundless may have been due, at least in part, to widely circulated reports—which in some measure were borne out by subsequent events—that Stalin had promised Hopkins a general amnesty would follow any conviction of the sixteen Polish leaders.

The trial, before the Military Collegium of the Supreme Court of the U.S.S.R., began on June 18. The principal defendants were Maj. Gen. Leopold Okulicki, commander of the Polish Home Army, and Jan Janowski, Deputy Premier of the Polish Government-in-exile. The charges against them and the other defendants were varied and serious, ranging from the clandestine use of wireless transmitters behind the Red Army lines to the alleged murder of 594 Soviet officers. Also included in the indictment was a charge that the defendants had plotted to bring about a future war in which Great Britain, Germany, and Poland would be aligned against the Soviet Union.

All but one of the defendants pleaded guilty to at least some of the charges brought against them. General Okulicki, in particular, frankly admitted his responsibility for espionage and sabotage acts committed by the forces under his command, but denied charges of terrorism. He and others displayed a certain pride in their actions which they considered patriotic. This attitude was also adopted by spokesmen of the Polish Government-in-exile in London who sought to justify the acts of the underground leaders, rather than deny them.

On June 21, twelve of the accused were found guilty and sentenced to prison terms ranging from ten years (for Okulicki) to four months. In view of the gravity of the charges, the comparative lenience of the sentences appeared motivated by political considerations. A number of the men sentenced to lesser prison terms were released in November, some of them long before the expiration of their terms.

Liquidation of the Government-in-exile. After the new Polish Government had pledged the holding of free elections at the earliest possible moment, in accordance with the Yalta Declaration, the United States and Great Britain extended their formal recognition on July 5. Most of the other United Nations followed suit, except France which had already recognized the new regime on June 29.

Thus the Polish Government-in-exile in London became to all practical purposes extinct, but the winding up of its affairs remained a long and arduous task. The greatest problem was presented by the Polish Army abroad, totalling about 200,000 men. With very few exceptions, the officers' corps of this army was opposed to the new Warsaw regime and attempts were made to influence the rank-and-file to the same attitude.

Immediately following the announcement that the Western Powers had recognized the Polish Government of National Unity, top commanders of the Polish forces in Britain and Italy challenged this decision and pledged continued allegiance to the Government-in-exile. Lt. Gen. Wladyslaw Anders, commander of the Polish Second Corps in Italy, ordered his troops to resist "enemy" efforts to persuade them to return to Poland; Maj. Gen. Klemens Rudnicki declared his men would return "only with arms in hand."

At the insistence of British authorities, polls were arranged for the Polish soldiers in various countries to decide how many wished to return under existing conditions. By mid-November, 23,000 out of 60,000 Polish service men in Britain had requested repatriation to the homeland, but only 15,000 out of 100,000 stationed in Italy had expressed the same wish.

The liquidation of the old government's bureaus and activities also presented many difficulties. The Warsaw Government first balked at a British demand for \$284,000,000 representing pay allowances, pensions, and civil expenses of the London

Poles, but eventually it agreed to pay this debt. Even after this arrangement had been made, publications of the Polish High Command abroad—now practically financed by Warsaw—continued to carry on a bitter propaganda against the Provisional Government. The Polish press protested against this paradoxical situation and also against alleged underground activities of the former Government-in-exile, and by the end of the year things had not yet been fully straightened out.

Poland and Potsdam. During the Potsdam or Berlin Conference of July 17-August 2, representatives of the Polish Provisional Government, including the President of the National Council Bierut, were received by the Big Three for consultation on Poland's territorial demands in the west and north. These turned out to be even greater than any previously put forth, but they were nonetheless met almost integrally, with Russia backing Poland to the hilt and the United States and Great Britain more or less reluctantly acceding.

As a result, Poland received all former German territories east of the Oder and Western Neisse Rivers, with the exception of Koenigsberg and an adjacent area given to Russia. Nominally these territories—East Prussia with Danzig, the eastern half of Pomerania, Upper and Lower Silesia, and a portion of Brandenburg Province—were only "placed under the administration of the Polish State," pending a final delimitation of boundaries at the peace settlement, but all signs pointed to a definitive annexation. Any remaining doubts in the matter were dispelled in the following months as the Polish authorities embarked on a policy of wholesale deportations of the millions of Germans still living in those areas, now marked for integral "polonization." This mass expulsion of an estimated 7,000,000 to 8,000,000 hardly corresponded to the spirit of the Potsdam Declaration which provided for the transfer of populations "in an orderly and humane manner." It was, in fact, begun even before the Big Three meeting at Potsdam opened. To fill the empty space left behind by the departing Germans, the Polish "Resettlement Bureau" appealed in particular to war veterans and to the youth to volunteer for resettlement in the west. Plans were made for the eventual transfer of 7,500,000 Poles into the formerly German provinces but up to the year's end only a fraction of this figure had actually been resettled.

With Poland's western frontier problem virtually settled at Potsdam to the satisfaction of even the extreme annexationists, the road was clear for a Polish-Soviet agreement on final delimitation of Poland's eastern boundary. A treaty to this effect was signed on Aug. 16 in Moscow. In accordance with the Yalta plan, it fixed the border between the two countries at the Curzon Line, with Russia conceding to Poland various strips of territory extending from three to eighteen miles east of the Curzon Line. The treaty defined the new frontier as follows:

From a point about two miles southwest of the source of the San River, thence northeast to the source of the San, then down downstream to a point south of Solina, then east of Przemyśl, west of Rawa Russka up to the Soloika River, thence along the Soloika and Zapadny Bug Rivers in the direction of Niermirow-Jalowska, leaving part of the Bjalowicz forest to Poland; thence to the meeting point of the Lithuania-Russia-Poland-East Prussia frontier, leaving Grodno to Poland. (New York Times, Aug. 17)

Under the same treaty, Russia agreed to turn over to Poland all claims of German property and

assets in Polish territory. In addition, Russia conceded to Poland (1) fifteen percent of all reparations deliveries from the Soviet zone of occupation in Germany; (2) fifteen percent of the industrial equipment due Russia from the western zones of occupation.

The New Poland. The Polish State that emerged from these arrangements is vastly different from the one Hitler conquered and wiped off the map. It has moved bodily westward for hundreds of miles. It has become ethnically more homogeneous and compact. It has been turned from a predominantly agricultural country into one in which industry and farming are extremely well balanced. It has acquired a wide coastline and several good ports on the Baltic Sea. It now has an almost completely round shape.

The Provisional Government, with great energy and considerable success, set about reorganizing the country's economic and social system. Fortunately, the rich industrial resources of Upper Silesia were found to be almost intact, owing to the Red Army's rapid advance in this area in the final phase of the war. Roads, utilities, communications also were in exceptionally good shape.

As a result, industrial recovery in the annexed western territories was far quicker and more complete than in the old Poland which the Germans had thoroughly plundered and devastated. By mid-November, the Silesian steel industry was producing at prewar level. Iron ore mining exceeded the prewar output, but could not fill the industry's full requirements. The deficit was made up through imports of iron ore from the USSR and Sweden. Coal production rose steadily.

The economic system evolved by the new Poland is a compromise between state control and private enterprise, with many activities still in a provisional phase. According to an article written in October by the noted economist Prof. Jaroslaw Orlowski, "government planning is to be found in banking, industry, and transport, and is also of considerable importance in trade. Private capital is prevalent in trade and handicraft, and is paramount in agriculture."

The great land reform initiated in September, 1944, was brought to a conclusion about a year later. During that time, some 10,625,000 acres of land seized from big estate owners in the territory between the Curzon Line and the Oder had been parcelled out to smallholders. There was no attempt at collectivization on the Soviet model, but all forests were nationalized. Key industries in the newly acquired western territories also were taken over by the State.

Political and social conditions were still very much in flux by the end of the year. Some foreign correspondents reported widespread terror and discontent with the new regime, allegations which the Polish press rejected as unfounded or exaggerated. As far as can be ascertained at this stage, Poland is on her way to becoming a semi-socialized democracy, although political freedom in the western sense is not yet fully assured.

JOACHIM JOESTEN.

POLO. Competition canceled through the war years in the United States was not revived last season although an American team led by the nine-goal Cecil Smith of Texas did take part in one tournament in Mexico City. After defeating Mexico's strong Herradura four, Smith's riders lost to the Military Selection team and Mexico City's Hawaiians.

THOMAS V. HANEY.

PONAPE. The main island (158° 10' E. and 6° 45' N.) in the eastern Carolines of the Japanese Pacific Islands. Total area, 145 square miles. Civil population (1938), about 11,468. There is a lagoon around the island formed by an outer reef. Jokai, a fortified islet, 876 feet high, in the lagoon provides the chief harbor landing. A naval establishment and large commercial docks were built by the Japanese. The chief exports are sugar, phosphates, bauxite, alcohol, copra, and dried fish. The island passed under the control of Allied armed forces as a result of the Japanese surrender in 1945.

PORTS AND HARBORS. A curious outcome of the war is that Bremerhaven, Germany, at the mouth of the Weser River and in the province of Bremen, is now an American port, serving that part of Germany occupied by the United States forces. In various ports of Europe these forces are conducting or supervising the clearing of wreckage and sunken ships from berths, docks, and channels, together with the salvaging of ships that can be floated; also the repair or reconstruction of such damaged works as docks, piers, locks, warehouses, freight sheds and cargo-handling machinery. A striking example is Cherbourg, France, which before the war was mainly a passenger port noted for its steamship lines and its elaborate marine and railroad terminal facilities. Besides clearing the works so thoroughly demolished by the Germans, the U.S. forces greatly increased the cargo capacity of the reconstructed port.

Since the Rivers and Harbors Bill of 1944 was defeated in December due to its inclusion of costly controversial projects, the bill passed in March, 1945, was the first since 1938. It included 292 projects, with a total cost estimate of \$382,000,000. The War Department, through the Corps of Engineers, U. S. Army, has jurisdiction over all navigable waters, and in the year ending with June 30, 1945, its civil work included the completion of 16 navigation projects, and the maintenance and improvement of 280 projects on the numerous streams and ports. Many of the larger projects continue from year to year and several, halted by war conditions, are now being resumed. Approved projects which can be put under construction in the fall of 1945 are estimated to cost \$67,000,000, while by the spring of 1946 additional works costing \$450,000,000 may be ready for contract. The Corps of Engineers, U. S. A., has completed port works at Arecibo, Puerto Rico, and is planning the repair and reconstruction of war-damaged ports in the Philippine Islands.

The U. S. Navy also has carried on much port work (emergency, temporary, or permanent), both at its home bases and in the South Pacific. These works are handled by the Construction Battalion (known as the "Seabees") and the Civil Engineering Corps. They include a breakwater at Apra, on Guam. Also piers and wharves for landing supplies at various places, using pontoons supported on 8-in. pipe piles and filled with coral and sand.

An outstanding accomplishment of the U. S. Navy was the design and construction of a large number of floating drydocks to accompany the fleets, so that battle damage could be repaired without sending or towing the ship to a distant port. They were of various sizes, the largest being capable of handling battleships, and built of steel, concrete, and wood. Parts of the sectional steel docks were built at inland plants, some as far inland as Pittsburgh. The docks or sections were towed to their destinations.

In Europe also, the U.S. Navy built landing

stages for supply ships and transports using groups of pontoons connected by Bailey demountable bridges. At Monrovia, in Liberia (west coast of Africa), an entirely new port was built, having facilities for large ships, and including a drydock, a quay wall 2,000 ft. long, and a rock breakwater.

Secret war ports established by both the United States and Great Britain were revealed in 1945. The former, in Excursion Inlet, Alaska, 950 miles north of Seattle, was put in service in 1942 but was abandoned and dismantled in 1945 as no longer needed. Two ports, with railway terminals and cargo-handling equipment, were established on the west coast of Scotland in 1940-42, when ports on Britain's east and south coasts were subject to submarine hazards. The Union of South Africa also established a secret port and naval base at Saldanha Bay, located on the west coast—100 miles from Cape Town.

Such commercial port facilities as marine and railway terminals, warehouses, transit sheds, docks, piers, shipyards, coal shipping plants, etc., are provided generally by private enterprise, more or less in cooperation with State and local authorities. A new Port Authority at Boston, Mass., is established under a State act which authorizes the sum of \$15,000,000 for modernizing the harbor, including railway terminals and freight facilities. Savannah, Georgia, plans port developments to cost \$5,000,000. At Houston, Texas, a bond issue of \$5,000,000 by the Houston Navigation District has been approved. Seattle has built a pier 1,020 ft. long and 400 ft. wide, with road and railway facilities and transit sheds. Cleveland, Ohio, has a new city department, the Office of Aviation and Port Development, in charge of port, railway and airport affairs. To protect the lake front at Cleveland from erosion, groins or jetties, composed of pre-cast concrete members, have been built. At Everett, Wash., extensive improvements are planned.

A coal and ore handling terminal in Maumee Bay, at Toledo, is a \$15,000,000 joint project of the Baltimore & Ohio and New York Central Railroads, which have had separate terminals 5 and 7 miles up the river, with access hampered by five drawbridges. On the other hand, two timber ore-shipping docks built for the U.S. Government at Escanaba, Mich., were abandoned and dismantled to provide timber urgently needed in war work. They were started in 1942 to provide for shipping ore from the Michigan mines in case of disablement of the canal at Sault Sainte Marie by enemy action or sabotage. There were to have been six of these docks.

The Mexican Government plans extensive improvements at Manzanillo, on the west coast. In Canada, shipment of iron ore from the new Steep Rock mine was begun from a concrete ore dock of the Canadian National Railways at Port Arthur, Ontario. The dock is 600 ft. long, with 50 pockets on each side, each pocket holding 300 tons. Four tracks are laid along the tops of the pockets, and ore is delivered by trains of 50-ton cars. A 276-ft. dry-dock of the cradle or marine-railway type, for vessels up to 2,500 tons, has been built at Victoria, B.C. At Sydney, New South Wales, the new concrete drydock for commercial and naval use was completed in 1945; it is 1,174 ft. long and 154 ft. wide, with 42 to 48 ft. of water on the sill. The Union of South Africa also completed its great drydock at Cape Town, 1,250 x 156 ft. with 48 ft. of water at high tide. Still another drydock, 750 ft. long and 110 ft. wide, is to be completed in 1946 at East London, South Africa. At Durban also,

there is a large new steel floating drydock, and extensive improvements are being made for liners, cargo vessels and warships, in expectation of post-war traffic. See **WATERWAYS**.

E. E. RUSSELL TRATMAN.

PORTUGAL. A republic of southwestern Europe. Capital, Lisbon.

Area and Population. Area, 35,490 square miles including the Azores and Madeira Islands. The population in 1940 was 7,722,152 including the Azores and Madeiras. Vital statistics (1943) births, 24.8 per 1,000; deaths, 15.3; infant mortality, 133 per 1,000 live births. Principal cities: Lisbon, about 800,000 inhabitants; Oporto, 262,309; Funchal, 48,493; Setubal, 35,071; Braza, 29,875; Evora, 21,851; Ponta Delgada, 21,071; Faro, 20,419; Coimbra, 20,216.

Defense. Military service is compulsory for men from 20 to 48 years of age, who serve for six years in the regular army. The total peacetime strength of the army is 3,200 officers and 27,000 enlisted men. There are also about 160,000 trained reserves. The navy consists of 7 sloops, 6 destroyers, 7 gunboats, 3 submarines and auxiliary vessels. Besides his army service, the Portuguese youth from 7 to 20 years gets military preparation in an organization named "Mocidade Portuguesa" modeled after the Fascist corps.

Education and Religion. According to the census of 1940, 67.8 percent of the nation was illiterate. Compulsory education has been in effect since 1911 and many measures have been introduced to decrease illiteracy. In 1939-40, the Government reported that more than half a million students received elementary instruction. There are 42 secondary schools and 4 universities. Freedom of worship exists, but the Roman Catholic faith prevails and plays an important role in the political, economic and social life of the nation (see below, **EVENTS**, 1945).

Economy and Finance. Agriculture is the leading occupation, followed in order of importance by fishing, mining and manufacturing. Estimated yields of the principal crops for 1945 do not differ from those of 1944 (see **YEAR BOOK** for 1944, p. 488) but the economy has suffered certain changes, according to the figures given by the National Statistical Institute.

The movement of trade for the year 1944 was as follows: imports, 3,836,000,000 escudos; exports, 3,095,000,000 escudos, showing an unfavorable balance of trade as compared with that of 1943.

Analysis of the trade movement by classes (in millions of escudos) is as follows: imports: livestock, 1.7; raw materials, 2,085.5; yarns, fabrics and accessories, 154.0; foodstuffs, 939.6; machines, apparatus, tools, etc., 258.0; various manufactures, 397.5. Exports: livestock, 16.9; raw materials, 805.9; yarns, fabrics and accessories, 432.4; foodstuffs, 1,371.2; machines, apparatus, tools, etc., 35.5; various manufactures, 432.8. Imports of wheat rose considerably because it was a bad year for agriculture. Exports decreased in value to the extent of 940 million escudos as compared with the previous year. Those products in which the decrease was most noticeable were resins, wolfram, tin, and tinned fish. Port wine, one of the principal exports, in 1944 reached the total of 180 million escudos, corresponding to 157,000 hectoliters, a figure far below the average (413,000 hectoliters) for the five years preceding the war (1934-38).

As a result of its strategic position and its neutrality, Portugal became one of Europe's most

important shipping centers. In 1944, she handled 485,000,000 escudos worth of merchandise in indirect transit, as compared with 322,000,000 in 1938. The amount of direct transit and trans-shipment merchandise amounted to 1,729,000,000 escudos in 1944 as compared with 92,000,000 in 1938. These transit figures are below the 1943 level, however, due to Portugal's loss of her trade with the Axis.

Transportation. There are 2,224 miles of railways. Highways and roads extend 15,357 miles. Eleven rivers are navigable. Portugal is one of Europe's most important shipping and air traffic centers. The merchant marine comprises about 800 ships.

Government. Portugal is governed as a Corporative State under the Constitution adopted on March 19, 1933. The organs of government are: a President or Chief of the State; a Premier or Chief of the Government, a Parliament composed of a Corporative Chamber and a National Assembly, a State Council, a Cabinet and the Judiciary.

The Chief of the State is elected every seven years. Voting is restricted to adult males who are able to read and write or who pay direct taxes to the State; to administrative corporations, and to adult females having a special secondary school or university diploma. The 99 members of the Corporative Chamber are appointed by local "autarchies" and administrative, moral, cultural, and economic institutions. The National Assembly of 90 members is elected for four years by the voters.

In the general elections of 1942, the only candidate in the running, General Antonio Oscar Frago de Carmona, who has held office since 1928, was reelected for another seven years, his term expiring on April 15, 1949.

The State Council is comprised of the President of the Republic (Chief of the State), the President of the Council of Ministers, the Vice-President of the National Assembly and Corporative Chamber, the President of the Supreme Court, the Attorney-General of the Republic and four other life members. The duties of this Council are to advise the President and to convoke or dissolve the National Assembly. The President appoints the Premier who, in turn, selects the Cabinet, but this body is not responsible to the President.

The only legal party is the União Nacional (Party of National Union) which supports the government. The opposition parties that tried to participate in the general elections of November, 1945, under the name of the United Democratic Movement, at the last moment instructed their members to abstain from voting (see below, **EVENTS**).

Events. The Portuguese Government became a dictatorship on May 28, 1926, after a military coup. Within a few days of their success, the leaders of the movement were disagreeing among themselves and as a solution to their problems, they selected General Frago de Carmona, who has the doubtful honor of being the Dean of European dictators, to head the new Government.

Soon afterwards, the Church succeeded in getting Antonio de Oliveira Salazar into the Government in the strategic post of Premier. In imitation of Mussolini's tactics, Salazar assumed control of the most important portfolios. He has always acted in accord with the Catholic Church and with his old schoolmate, Monsignor Cerejeira, who is one of Lisbon's most influential figures. To prevent any demonstration of opposition from the democratic parties, Oliveira Salazar resorted to the methods common among dictators: imprisonment and mass deportations to the Portuguese possessions in Africa and in the Pacific. All the liberally inclined mem-

bers of the army were discharged. During the first years of the dictatorship there were several revolts, but they were easily quelled. The last one occurred in August, 1936 when the crews of warships anchored in the Tagus River mutinied and tried to join the navy of Republican Spain.

Most of the liberal Portuguese are living in exile in Paris and London. For example, Jaime Cortesao, ex-director of the Lisbon National Library, and José Domingues dos Santos, who, in spite of his long absence, has a large following among his countrymen.

Portuguese labor has not let itself be assimilated by the dictatorship, which has made futile attempts to build up a corporative state based on vertical syndicates. On numerous occasions the workers, grouped in underground unions, have promoted strikes with political objectives, the most important one being the general strike of 1943 which for one week stopped all transportation in Lisbon and Oporto (see YEAR BOOK for 1944, p. 489).

1945 has been an uneasy year for Oliveira Salazar, as well as for his colleague Franco. Germany's defeat and the end of the Pacific war have made his regime increasingly less popular in other countries and in his own.

The dictator became seriously worried early in the year over unemployment and the poverty-stricken condition of the masses, which the Government attributed to the war. One paper, the official organ of the regime, stated in reference to this situation: "The problem of relief is an acute one with which all governments have to contend, here and everywhere. The sacrifices imposed by the war have lessened the economic resistance of many people." The "Winter Relief Fund" was organized and the government, strange to say, admitted that as wages were not adequate enough to permit the workers to contribute, they should work one extra hour daily and give the equivalent wage to the Fund.

In February, Portugal established diplomatic relations with the Provisional Government of France. Monsieur Jean du Sault was formally received in the Palace of Belém by President Carmona and Premier Salazar. De Gaulle's Government, forgetting Salazar's benevolent neutrality toward Germany at the beginning of the war, hastened to improve its relations with its neighbor, with whom it now shared the common goal of safeguarding a colonial empire. The new French Minister on every possible occasion recalled the "past" glories of Portugal, and the dictator felt pleased that he could officially place France next to his other great ally, the British Empire. Portugal and Great Britain have the oldest treaty of alliance in all Europe, dating back to 1373, by virtue of which (and when the war had taken a turn for the better) Salazar made important concessions to the cause of the United Nations (see YEAR BOOK for 1944, p. 489).

Toward the end of February, the "Diário da Manhã" published some interesting statements by President Carmona and Premier Salazar with reference to the country's international position. Both of them were anxious to explain to the United Nations the reasons for Portuguese neutrality. Carmona declared, "England has not asked us, in the name of our ancient alliance and friendship, to enter the conflict." But he was careful to add that, "Germany has informed us that she will respect Portugal's integrity and our overseas possessions if we remain neutral."

Conditions within Portugal remained during the first months of the year as they had during the final

months of the preceding one. In the capital and larger cities, the upper classes were enjoying the advantages of living in a neutral country whose economy was mobilized for war. The laboring classes and rural population, on the other hand, were feeling the pinch of inflation. The governing classes were interested in maintaining friendly relations with the Allies, especially with Great Britain, but their efforts in this direction did not prevent them from officially offering their condolences to the German Government on the occasion of Hitler's death. The British Ambassador in Lisbon, Sir Ronald Campbell, chose to ignore this fact and honored the Head of the State, General Carmona and the President of the Council, Dr. Oliveira Salazar with a banquet at which he expressed England's appreciation of Portuguese "neutrality." He spoke of the "glorious past and great future of the country, whose great qualities are personified in the Head of the State."

Domestic politics have been dominated by the government party, the União Nacional, which is the only legal party. The press remained in government hands, or was controlled by conservative concerns supporting the Government. The *Diário da Manhã* is Salazar's official paper. The *Diário da Lisboa*, *Diário de Notícias*, *Diário Popular* and the *Jornal de Comercio* are traditionally conservative. *Novidades* is the organ of the Catholic Church and *A Voz* expresses monarchist leanings. The only liberal newspaper is *A República* but its circulation declined under the pressure of strict government censorship.

Early in October, Portugal sustained a political shock. Salazar announced his intention of convoking the Parliament and holding elections by restricted suffrage. The importance of this announcement can not be overestimated, for the Portuguese people have been living for 20 years under a government in which they have had no voice whatsoever. The news brought about the reappearance of Republicanism. Two important liberal groups, "União Democrática" and "Esquerda Democrática," prepared themselves for the elections. *A República*, the liberal newspaper, increased its circulation from a mere 12,000 copies a day to 60,000. Even the Monarchists got ready for the great event and the *Diário Popular* actually defended the restoration, declaring itself in favor of the candidacy of Duarte Nuno de Braganza. The *Diário Popular* was suspended by the government.

The government was concerned over this demonstration of agitation which was stirring the country. The Minister of the Interior, Colonel Botelho Moniz, sent the police to "advise" the citizens to abstain from politics. The foreign correspondents noticed that censorship became more rigid.

The much-publicized elections offered by Salazar hardly provided representation of the people. The restricted suffrage proviso limited the number of voters to 943,000 and of these only 56 per cent went to the polls. The foreign correspondents declared that, "The election was signalized by the lack of incidents and apparently by the lack of interest. The opposition parties operating under the name of United Democratic Movement had no candidates and instructed their members to abstain from voting."

Salazar's regime is no more popular because of the elections. The democratic forces have declared that they will continue their passive resistance and that they "will not resort to force until all other means fail." The labor group states that it can call a general strike at any time, but so far nothing has been effected in this direction.

Portuguese Possessions. The Portuguese colonial empire in Africa, Asia and Oceania consists of:—

Colonies	Area Sq. Mi.	Population
<i>Possessions in Africa:</i>		
Cape Verde Islands (1940) ..	1,557	181,286
Guinea (1940) ..	13,944	351,089
Príncipe and S. Tomé Islands (1940) ..	384	60,490
Angola (1940) ..	481,226	3,738,010
Mozambique (1940) ..	297,654	5,081,266
<i>Possessions in Asia:</i>		
India (1936) ..	1,537	579,970
China: Macao, etc. (1940) ..	6	374,737
<i>Possessions in Oceania:</i>		
Timor (1940) ..	7,330	474,363
<i>Total</i> ..	803,638	10,830,844

According to the Colonial Act of 1930 which was included in the Constitution approved by plebiscite on March 19, 1933, the Portuguese colonies are under the control of the Metropolis. Each has a governor and enjoys financial and administrative autonomy. Their budgets must be approved by the Minister for the colonies and no colony is permitted to contract a public loan in a foreign country. The natives and the ownership of lands and cultivation are defended and protected by the State, which forbids the forced labor of natives except for public service, punishments or payment of taxes.

Portuguese India comprises Goa, Damán, and Diu. The capital is Panjim (Nova Goa). Chief products are: manganese (3,300 metric tons, 1940), coconuts, fish (fresh and salted), spices, cajunuts, salt and copra. In 1940 the imports by sea and land amounted to 104,933,000 escudos; the exports, to 19,646,000 escudos. There are some 51 miles of railways and 730 miles of roads. In 1938 there were 503 elementary schools, 12 secondary schools, a medical school and a teacher's training college. Public debt, January 1, 1943, 15,029,550 escudos. Governor General, Colonel José Ricardo Pereira Cabral.

Macao, in China, situated on an island of the same name at the mouth of the Canton River, forms, with the two small adjacent islands of Taipa and Colôane, a province. The city is divided into two wards, one inhabited by Chinese, and the other by non-Chinese, each having its own administrator. Of the total population in 1940, 8,989 were Portuguese. The trade of Macao, a free port, is mostly transit and is in the hands of the Chinese. Served principally by British, Japanese and Dutch steamship lines, 6,406 steamers of 3,111,571 gross tonnage, cleared the port in 1938. The budget in 1943: 41,275,760 escudos. The Governor, Commander Gabriel Mauricio Teixeira.

Portuguese Timor (occupied by the Japanese during February, 1942) consists of the eastern portion of the island of that name in the Malay Archipelago, with the territory of Ambeno and the neighboring islands of Pulo Cambing and Pulo Jako.

The capital Dili (Dilly or Dilli), with about 3,000 population, is the chief port. Principal exports are: coffee, sandal-wood, sandal-root, copra and wax. Imports (1940) were 3,880,000 escudos; exports, 4,154,000 escudos. Public revenue and expenditures were estimated for 1943 as balanced at 9,429,674 escudos (nominal value of the escudo was \$0.0412, Nov. 8, 1943). Public debt on Dec. 31, 1941, was 31,279,164 escudos. There is a good road system of 677 miles, telephone lines of 1,656 miles, and a wireless station at Dili. Governor: Captain Manuel de Abreu Ferreira de Carvalho.

For Portuguese possessions in Africa, see PORTUGUESE AFRICA.

MIGUEL JORRÍN.

PORTUGUESE AFRICA. This heading comprises five colonies along the west and southeast coasts of the continent. Not included are the Madeira Islands, which administratively are treated as an integral part of Portugal.

Cape Verde Islands. An archipelago of some fourteen islands lying off the coast of Senegal, with an area of 1,557 square miles and a population (1940) of 181,286 (the great majority of which are half-castes, with most of the remainder classified as Negroes). The colony is administered by a Governor, who resides at Praia. The islands' economy is rather primitive and figures very little in world trade. The principal products are sisal, castor oil, high-grade coffee, oranges, brandy, and hides. Porto Grande is an important fueling station for shipping on the routes from Europe to South America and Africa.

Portuguese Guinea. An enclave of territory bounded on all landward sides by French West Africa, with an area of 13,944 square miles and a population (1940) of 351,089 (of which over 98 percent are Negroes). The climate is quite unsuitable for white settlement. The colony produces some agricultural articles for export, such as palm oil and kernels, hides and peanuts, but its importance lies rather in its position near the bulge of Africa, where Pan American Airways found it convenient before the war to establish landing facilities on its transatlantic route. The seat of Government is at Bissau, which is also the colony's chief port: The former capital Bolama, is among the less important ports.

São Thomé and Príncipe. These two volcanic islands, lying in the Gulf of Guinea, are treated administratively as one unit, with a Governor residing in São Thomé. They have an area of 372 square miles and a population (1940) of 60,490 (of which 56,666 were Negroes). São Thomé is by far the larger and more important of the two, and also accounts for about nine-tenths of the total population. Its mountains rise to some 7,000 feet, the soil is fertile and there is abundant rainfall. Despite their small size the islands produce large amounts of cacao, as well as some coffee, copra, and palm oil. There is a considerable movement of seasonal labor back and forth between the islands and the near-by continent.

Angola (Portuguese West Africa). This important colony, largest in the Portuguese empire, has an area of 481,351 square miles and a population (1940) of 3,738,010, of which 44,083 were Europeans and 28,305 half-castes. The Negro population consists largely of Bantu stock still dwelling in a tribal state. The administration of the colony is headed by a Governor-General, assisted by an Advisory Council, the members of which are in part appointive and in part the elected representatives of certain economic organizations of the European inhabitants. Educational opportunities are restricted to less than 100 schools but are gradually improving.

Angola is generally regarded as one of the richer colonies in Africa—it was coveted by both the Nazi and Fascist regimes. Portugal has usually looked to Great Britain to help her defend the territorial integrity of her colonial empire. However, Angola's economic development is still only in the early stages. Among the principal exports are coffee, diamonds, sugar, and palm oil. On the interior plateau, which has a temperate climate, it

is hoped eventually to open up large areas to European settlers who will produce cotton, wheat, tobacco, and other exportable items. The principal railroad is the Benguela Railway, which runs from Lobito on the Atlantic Ocean through the Belgian Congo to Northern Rhodesia. The future capital, Nova Lisboa, is located along the plateau section of this railroad line. The present capital is the port city of São Paulo de Loanda, established in 1575.

Mozambique (Portuguese East Africa). Mozambique is the most populous of Portugal's possessions, with an area of 297,731 square miles and a population (1940) of 5,081,266—27,438 Europeans, 15,461 half-castes, 9,147 Indians, and 5,027,591 Negroes. The colony is administered by a Governor-General who is assisted by an Executive Council and by a Government Council comprising both officials and representatives elected by certain economic interests. Until 1942 the Companhia de Moçambique administered the territory of Manica and Sofala. Since then the state has been in direct control of the entire colony, which is divided into four provinces: Sul do Save, Manica and Sofala, Zambezia, and Niassa. The capital is at Lourenço Marques. Education is provided by some 700 primary schools, 48 professional schools and one high school.

Mozambique produces important quantities of sugar, corn, copra, sisal, cattle and other animals. A great deal of the foreign trade of the Transvaal and its rich Rand mining region passes through the port of Lourenço Marques over the Delagoa Bay Railway. In the same manner, the port of Beira is the outlet, over the Beira Railway, for a considerable part of the foreign trade of the Rhodesias. Beira is also connected by rail with the Nyasaland Protectorate. Along this latter route lies the lower Zambesi Bridge, 12,064 feet in length (said to be the longest bridge in the world). During 1942 over 1,400 ships entered the ports of Beira, Lourenço Marques, and Mozambique.

Events, 1945. In a decree dated April 21, 1945, the Portuguese Government provided for the reorganization of the health services in its colonies. The two primary objectives of this reorganization were to be: to protect, defend, and augment the native population wherever it may be, improving its sanitary conditions and its standard of living, to facilitate the adaptation of whites to tropical regions, whether by assisting individuals preventively or curatively, or by seeking to transform the environment. To attain these ends not only hospitals but numerous health centers and sanitary posts were to be established.

In June the Portuguese Minister of Colonies, Dr. Marcelo Caetano, witnessed the opening of a large and modernized new port at Loanda in Angola, which was said to be one of the best in Africa.

In Mozambique the Government introduced measures to increase the agricultural productivity and to promote the economic welfare of native farmers. At the same time the Government took steps to assist the process of industrialization, particularly the expansion of weaving mills. These were to be encouraged to supply the local market but not to interfere with the home industry of Portugal. In September a British concern, the Marconi Wireless Telegraph Company, revealed that it had contracted to install a complete system of radio communications in Mozambique. This scheme provided for the construction of twelve stations which when completed would give the colony "one of the most up-to-date and efficient radio telegraph and telephone systems in any colonial area."

The Portuguese Government announced in Au-

gust that troops which had been organized and trained in Mozambique were being sent to reoccupy the island of Timor which the Japanese had seized early in 1942.

Among the thirty-two new Cardinals announced by the Vatican on Dec. 23 was the Archbishop of Lourenço Marques, Teodosio Clemente de Gouveia, who upon being confirmed in his office would be the only member of the College of Cardinals from the whole continent of Africa.

ROBERT GALE WOOLBERT.

POSTAL RATES. Domestic mail, according to the *United States Official Postal Guide*, includes matter deposited in the mails for local delivery or for delivery from one place to another within the U.S., and is divided into four classes. First-class mail includes written matter, matter sealed against inspection, postal cards, and private mailing cards. Second-class includes newspapers and periodical publications. Third-class includes merchandise, printed matter, and other mailable matter not greater than 8 oz. in weight. Fourth-class (parcel post) includes merchandise, printed matter, and other mailable matter exceeding 8 oz. in weight.

Rates of Postage on First-Class Mail. Written and sealed matter in general is 3 cents for each ounce or for each fraction of an ounce. Postal cards are 1 cent each. Private mailing cards (post cards) which meet the requirements for such cards are 1 cent each. "Drop letters" and other first-class matter are 1 cent for each ounce or for each fraction of an ounce, provided that they are mailed at offices where letter-carrier service has not been established and that the addressees are not served by rural or star-route carriers. Letters, bills, statements, etc., prepared in the central office of a company rendering service in places other than its central location, are eligible for local delivery in such places provided that the postage on each piece of mail is prepaid at the local rate. Letters received under cover, with postage paid on the bulk package at the letter rate, are acceptable for local delivery only if each letter is prepaid at the first-class rate. The charge for business reply cards and for letters in business reply envelopes is the regular rate plus 1 cent. A letter returned to the sender must be mailed in a fresh envelope with the proper postage. The limit of weight for first-class mail is 70 lb.

Air Mail Rates. The domestic rates for air mail include all available transportation by air. A rate of 8 cents per ounce applies to deliveries from one post office to another on the mainland of the U.S., including Alaska, from one to another in the Hawaiian Islands, in Puerto Rico, in the Virgin Islands of the U.S., and between the Virgin Islands and Puerto Rico, but not between the mainland and any of these islands. A rate of 6 cents applies to mail to members of the armed forces outside the continental U.S., including civilian employees who receive mail through Army and Navy post offices overseas. Air mail which is to be sent through the domestic mails and across the Pacific Ocean by steamer should be endorsed "Via Air Mail except over the Pacific." Other rates, cents per half-ounce, are as follows:

Canal Zone	10	Philippine Islands.....	50
Canton Island	25	Puerto Rico.....	8
Guam	35	Virgin Islands of the	
Hawaii	15	U.S.	8

International Air Mail. The postage rates for air mail from the U.S. to various foreign countries are listed in the table on page 470.

master General July 1, succeeding Frank C. Walker of Pennsylvania.

The year saw an increase in the volume of mail from 34,500,000 pieces to 38,000,000,000. This mail was handled at a time when 56,000 experienced employees were serving in the armed forces. Revenues for the fiscal year which ended June 30, 1945, rose from \$1,112,000,000 to \$1,314,000,000. Accrued expenditures were approximately \$1,151,000,000. The year's surplus was \$162,642,089. Total financial transactions—including postal savings, war bond sales, revenues, expenditures, etc., increased from \$16,000,000,000 to \$17,000,000,000. There were in operation 41,395 post offices and 447,000 persons were employed, exclusive of contract workers.

Geared primarily to the needs of war during the first eight months of the year, the Postal Establishment sought to put back into force full peacetime service as rapidly as possible. The temporary rate of 8 cents an ounce on domestic air mail was scheduled to revert to 6 cents six months after the termination of hostilities, and studies of possibilities of more widespread use of air transportation for the mail were made.

ROBERT E. HANNEGAN.

POWER, Division of. A division of the U.S. Department of the Interior which coordinates the power phases of the various bureaus of the department. During the war most of its efforts were aimed at meeting the power requirements of the war program. Director: Arthur E. Goldschmidt.

PRESBYTERIANS. A religious connection adhering to a system of church government by presbyters or elders and having some 60,000,000 members throughout the world. In the United States there are ten Presbyterian bodies, the largest of which follow.

Presbyterian Church in the United States of America. The largest body of the Presbyterian communion, represented by churches in every State of the Union and having official mission stations in Alaska, Cuba, Puerto Rico, and 16 foreign lands. In 1945 its churches in the United States and abroad were organized into 40 synods and 268 presbyteries. Statistics for the year ended Mar. 31, 1945, showed a total communicant membership in full standing of 2,161,872, the largest number in the history of the Church. The known adherents number approximately 5,000,000. The Sunday school enrollment was 1,257,454. The number of churches was 8,604 and of ordained ministers 9,519. Contributions during the year amounted to \$59,669,015, of which \$49,020,112 was for current expenses and the remainder for benevolences. The Board of National Missions received \$2,995,079; the Board of Foreign Missions, \$2,815,951; the Board of Christian Education, \$907,639; and the Board of Pensions, \$202,332. The Church maintains 48 colleges and 10 theological seminaries. It published three national official periodicals, *Monday Morning, Everyone, and Women and Missions*.

The 157th annual General Assembly was held at Minneapolis, Minn., May 24-30, 1945. The Reverend William B. Lampe, D.D., LL.D., pastor of West Presbyterian Church, St. Louis, Mo., was elected Moderator. The Assembly authorized the raising within three years of a \$27,000,000 fund for postwar reconstruction and rehabilitation of the Church in the United States, in Europe, and in foreign missionary fields. It declared its support of full membership by the United States in the United Nations Organization, and urged the Unit-

POST OFFICE, U.S. As mail volumes rose to an unparalleled height, the Postal Service moved to re-establish its activities on a peacetime basis and to take advantage of improved transportation media.

Robert E. Hannegan of Missouri became Post-

ed States Government to promote, through that international organization, "equality of rights and opportunities among the member states," observance of "human rights and fundamental freedoms by all nations toward all peoples," reeducation of the German and Japanese people, and "reconciliation between victor and vanquished." Approval was given also to a report indicating continued progress toward organic union between the Presbyterian Church in the United States of America and the Presbyterian Church in the United States (Southern) and also the Protestant Episcopal Church. The Church has its headquarters in the Witherspoon Building, Philadelphia 7, Pa., in charge of the Rev. William Barrow Pugh, D.D., LL.D., Stated Clerk.

The Presbyterian Church in the United States (South). The division of the Presbyterian denomination which covers the territory commonly known as the Southern States. It was composed in 1945 of 17 synods (in most cases, corresponding to state lines) and 87 presbyteries, with 3,513 organized churches, 2,586 ministers and 580,369 members, exclusive of ministers. During the year 20,714 members were received on profession of faith, and 25,954 by certificate. There were 12,035 adult baptisms and 9,559 infant baptisms. The ruling elders numbered 18,659, and deacons 22,112. Contributions for current expenses during the year amounted to \$5,721,307, for pastors' salaries \$3,811,606, for building expenses \$3,443,950, and for benevolences \$5,656,925; a grand total of \$18,633,788, an increase over the preceding year of more than \$2,600,000. The total per capita gift was \$32.10, of which \$9.74 was for benevolences and \$22.36 for current expenses.

The 85th General Assembly of the Church convened in Montreat, N.C., 24 May, 1945, with 365 commissioners present. Rev. Thomas K. Young, D.D., pastor of the Idlewild Presbyterian Church, Memphis, Tenn., was elected moderator. Actions taken by the General Assembly of special interest are as follows: The Committee on Cooperation and Union was instructed to continue "to explore and search in suitable ways and means of bringing into one body all branches of our Presbyterian family"; specifically to "endeavor to perfect as soon as practicable the plan for reunion of the Presbyterian Church in the United States of America and the Presbyterian Church in the United States"—Overtures asking that the General Assembly withdraw from the Federal Council of Churches of Christ in America were answered in the negative. A goal of 50,000 won to Christ on profession of faith during the year was adopted enthusiastically. Much impetus was given to the work of the Committee on Radio by fixing a budget of \$30,000.00 and by the approval of efforts to extend the Presbyterian Hour over a live voice network which would cover the territory occupied by the Church.

This Church continues to go beyond its quota of Chaplains in the Armed Forces with 151 in the Army and 119 in the Navy. This total is more than 10% of all ministers in the Church and 13% of all in active service.

Plans are being made for the rehabilitation of the Foreign Mission work in the Orient. All of the fields of this Church were affected by the war because stations in Japan, Korea, and China were overrun by the Japanese.

Training of recruits for the Ministry and Lay service is conducted in the four Theological Seminaries and the Training School for Lay Workers. Thirteen colleges controlled by synods and two affiliated colleges provide a Christian education

for young men and women, who will be the future leaders of the Church. Seven Junior Colleges, eight secondary schools and three mission schools (one for Indians and two for Mexicans) continue to render splendid service. Sixteen Orphans' Homes and Schools take care of the bodily, mental and spiritual needs of more than 1,600 children.

The 1946 meeting of the General Assembly will convene in Montreat, N.C., on 23 May.

United Presbyterian Church of North America. A member of the family of Presbyterian Churches, of Secession and Covenanter origin, formed by the Union in Pittsburgh, Pa., May 26, 1858, of the Associate and Associate Reformed Churches. The General Assembly of the Church convened in Monmouth College, Monmouth, Ill., May 30, 1945. The membership of the church is 198,759 in America and 68,705 in Egypt and India. The contributions in America averaged \$31.35 per member for the year. The Moderator of the General Assembly is Rev. James M. Ferguson, D.D., Pittsburgh, Pa. The Clerk of the General Assembly is Rev. O. H. Milligan, D.D., LL.D., Pittsburgh, Pa.

Cumberland Presbyterian Church. One of the Presbyterian bodies whose chief strength is in the Southern States. It differs from most Presbyterian denominations on the theological doctrine of fatalism. The 1945 statistical report shows: 1,063 churches; 752 ministers; total membership of 70,567. There was a membership gain over last year of 6,350. A General Assembly which meets annually is the supreme judiciary, the 1945 meeting was held in Lewisburg, Tennessee, May 31–June 5, 1945. Rev. S. T. Byars of Rogersville, Alabama, was Moderator, and the Rev. Wayne Wiman of Nashville, Tennessee, was Stated Clerk, Treasurer, and General Secretary.

PRICE ADMINISTRATION, Office of (OPA). The purposes of the Office of Price Administration as enumerated in the Act which created it are: to stabilize prices and to prevent speculative, unwarranted, and abnormal increases in prices and rents; to eliminate and prevent profiteering, hoarding, manipulation, speculation, and other disruptive practices resulting from abnormal market conditions or scarcities caused by or contributing to the national emergency; to assure that defense appropriations are not dissipated by excessive prices; to protect persons with relatively fixed and limited incomes, consumers, wage earners, investors, and persons dependent on life insurance, annuities, and pensions from undue impairment of their standard of living; to prevent hardships to persons engaged in business, to schools, universities, and other institutions, and to the Federal, State, and local governments which would result from abnormal increases in prices; to assist in securing adequate production of commodities and facilities; to prevent a post-emergency collapse of values; to stabilize agricultural prices in the manner provided in section 3 of the Price Control Act; and to permit voluntary cooperation between the Government and producers, processors, and others to accomplish the aforesaid purposes.

In June 1945, a joint resolution of Congress extended the effective period of the Emergency Price Control and Stabilization Acts of 1942, as amended, until June 30, 1946, with only minor changes, principally concerning OPA regulations on meat pricing and distribution.

The agency programs for the control of prices and rents and the rationing of consumer goods were continued throughout 1945. Prior to V-J Day virtually the whole price structure was under con-

trol; the major exceptions were a few agricultural commodities, control over which is legally prohibited until prices reach certain levels, and combat equipment. Control was administered through the General Maximum Price Regulation and 574 individual price regulations (as of Dec. 31, 1945). After V-J Day, OPA was confronted not only with the task of continuing to hold prices steady but of seeing that price ceilings would not impede production of goods essential to a sound peacetime economy, and at the same time preparing for orderly relaxation of controls.

The success of OPA in preventing inflation through the war period may be measured by the fact that, despite difficulties encountered with some cost-of-living components such as clothing and housefurnishings, the Bureau of Labor Statistics' Consumers' Price Index (formerly known as the Cost-of-Living Index) moved up only 2.3 percent during the calendar year of 1945. From May 1943, when the rise in the cost of living was halted under President Roosevelt's hold-the-line order, through December 1945, OPA held the consumer price level to a mere 3.8 percent rise. The total rise in the consumers' price index from August 1939 through December 1945 was 31.7 percent, most of which occurred before May 1942, when OPA instituted price control at retail under the General Maximum Price Regulation. Another measure of the success of the price control program is to compare these figures with similar ones for World War I. Between July 1914 and November 1918, the cost of living rose 61.8 percent, and by July 1920 (the period corresponding to the duration of World War II), the cost of living had risen 107.5 percent above the July 1914 level. The peak increase of 108.4 percent had been reached in the previous month, and by July the devastating decline had already begun which was to carry us into one of our worst depressions.

Similar comparisons may be made with regard to the wholesale prices of industrial commodities (farm and food prices being excluded). Their total rise between August 1939 and November 1945 was 25.1 percent. Between May 1943 and November 1945, however, the rise was held to 3.6 percent. During the first 11 months of 1945, these prices rose 1.3 percent. By Armistice Day, 1918, industrial prices had risen 97.7 percent and by July 1920, they had reached 163.9 percent above pre-war levels.

OPA's contribution to price stabilization during 1945 was accomplished largely through vigorous enforcement of the regulations. The policy of simplifying the regulations, wherever possible, to facilitate compliance was continued during the year, as was the policy of decentralization with more and more authority being delegated to field offices to act on price and rationing matters within the broad policy limitations set down by the National Office. No little part in the task of stabilization was played by the representatives of various economic and industrial groups on the policy advisory committees set up by OPA.

A Consumer Advisory Committee in the national office provides a channel through which consumers can present their problems and can suggest methods of obtaining clearer understanding of regulations and better compliance. About 50 such committees were in existence in OPA district offices during 1945.

Agricultural advisory committees were established throughout the country in order to bring closer together the viewpoints of the office and 7 million farmers. There were 50 such committees.

The Labor Policy Committee in the national office is composed of representatives of the American Federation of Labor, the Congress of Industrial Organizations, and the railroad brotherhoods. In addition there is a regional labor advisory committee in Cleveland, Ohio, and 107 district committees are scattered throughout the country. Serving on these committees were almost 1,500 labor people.

The industry advisory committees, setting up of which are mandatory under the law, bring to OPA problems the knowledge and experience of business and industry. They advise on drafting, administering, and simplifying regulations. During 1945, 621 such committees were active, 122 of which were set up during the year. More than 7,500 representatives of industry served on these committees.

The establishment of national industry advisory committees for rent control was made mandatory by Congress in June 1945. Three such committees were set up before the end of the year, for hotels, housing, and motor courts. There were no local committees.

Post V-J Day Problems. OPA's plans for the immediate postwar period implemented the President's Executive Order 9599. This order charged the Price Administrator with taking all necessary steps to assure that the cost of living and the general level of prices would not rise, and with making such adjustments in existing price controls as were necessary to remove gross inequities or to correct maladjustments or inequities which would interfere with the effective transition to a peacetime economy. The Administrator was further directed "so far as is reasonable, practicable, and necessary for this purpose" to see that such price increases did not cause price increases at later levels of production or distribution, and, in those fields where price control had hitherto been insufficiently effective, to improve and tighten controls for those commodities which were important to production costs or to the cost of living. At the same time, the Administrator was directed to remove controls as rapidly as possible without endangering the stability of the economy.

The new pricing program covered both entire reconverting industries and individual manufacturers, as well as certain firms whose production had been greatly curtailed during 1944. Basic reconversion policy had the twin objectives of preventing inflation and at the same time encouraging maximum production and full employment. The general plan was to institute a broad-scale review of the prospective adequacy of existing ceilings in all important reconversion industries, to set up procedures for calculating individual adjustments under as simple a method as possible, to extend widely dollar-and-cent pricing with retail ceilings pre-ticketed at the manufacturing level, and, insofar as possible, keep consumer prices close to 1942 ceilings.

The special pricing formula for reconverting industries worked out in the spring of 1945 took into account the legal increases in the price of materials and in the basic wage rate schedules of factory employees occurring since 1941, when such items as automobiles, washing machines, vacuum cleaners, and other consumer durable goods were last on the market, and allowed for the same profit margins before taxes as during 1936-39, a "normal" peacetime period. This formula did not attempt to take into account all the factors which had affected production costs since 1941. It ignored some factors which temporarily increased costs, such as dislocation of supply, less efficient labor, payment of

overtime rates and shift differentials; but it similarly ignored factors which had decreased costs, such as the unprecedented ease of selling and the effect of technological progress achieved in many industries during the war period. To speed pricing under this formula, OPA issued industry-wide price increase factors which each manufacturer in the industry might use in calculating his own reconversion ceiling.

A companion program was designed to give reconverting firms individual price adjustments in situations where industry-wide adjustments were not suitable. To accelerate action, authority was delegated to OPA field offices to handle more than 90 percent of the applications of individual adjustments.

Another virtually automatic pricing method was provided for all reconverting firms expecting gross annual sales of less than \$200,000, with proposed ceilings becoming effective if not vetoed in 15 days. About two-thirds of all reconverting firms were thus provided for. These firms could add to their 1941 costs of a product, adjusted for legal increases in their own materials prices and straight-time wage rates, their own 1936-39 profit margin, or one-half the industry's margin. Where sales volume was under \$50,000 a year, the formula was still simpler, for the firm was allowed to estimate current costs of making the product and to add one-half the industry's profit margin, or its own margin for the first calendar year for which it had profit-and-loss information during 1939-41.

Price relief for larger reconverting firms was provided when they could show that their 1941 costs, adjusted for legally increased materials costs and basic wage rate schedules, were higher than current ceilings.

The OPA also undertook during this period to facilitate ceiling price adjustments for manufacturers who had maintained production of prewar goods throughout the war. Many of these manufacturers had not qualified for price increases under OPA war policies. Prior to V-J Day, industry-wide increases not required by law were granted to stimulate or maintain production of a particular commodity needed for the prosecution of the war or for civilian needs. Individual adjustments, permitted on the same basis, had been granted primarily to the out-of-line low-priced seller, in order to assure his production. No adjustments to relieve individual hardship in any and all cases were provided for, since such a practice might have led to diversion of short materials and manpower from essential wartime work. During the reconversion period, however, the problems of these non-reconverting manufacturers were provided for in a "general rescue" order which applied to companies that were losing money on over-all operations, and assured them all costs of production and distribution, though new prices might be higher than for the industry as a whole.

Another step to speed transition to a peacetime economy was to remove controls as fast as the situation warranted. A large number of items freed from control during the last months of the year were unimportant as living or business costs, or were already selling below ceiling prices. In general, the policy adopted was to drop price control over a particular commodity as soon as it appeared likely that balanced demand and supply would keep prices stable. For most commodities, the heavy inflationary pressures on prices made de-control impracticable during the year, even after V-J Day. The large accumulation of liquid savings, the abnormal volume of currency in circulation,

and the magnitude of government spending, along with the huge backlog of unsatisfied consumer demand made it too dangerous to the stabilization program safely to scrap controls, except for a minor number of commodities. The Price Administrator emphasized that if the national economy were to remain stabilized, rapid de-control was not possible, and that if the nation were to avoid the inflationary spiral and the consequent economic collapse that followed after World War I, the Office must continue to be vigilant in controlling prices, especially in fields like food, clothing, reconversion consumer goods, building materials, and residential rentals.

The close of the war brought no relaxation in controls over residential rents. OPA announced it would lift controls area by area as pressures against rent ceilings abated, but that continued vigilance was necessary to prevent inflationary rises in rentals in areas where pressures still existed. Under this selective policy, control was withdrawn from a number of areas or portions of areas where decline or ending of war activities, including the closing of camps, training schools, and air fields, had resulted in housing vacancies which removed pressures on rents. At the same time eviction rules were strengthened to protect tenants from being forced from their homes in crowded areas where there were few or no vacancies in the price range they could afford. From the consumer point of view, OPA's rent control program had been highly successful, for the Bureau of Labor Statistics' Consumers' Price Index showed that rents had remained at the same level throughout the 12 months of 1945, had declined 1½ percent since May, 1942, and had risen less than 4 percent since the beginning of the war in Europe.

In the field of rationing, reduced military demand, releasing large stores of supplies to the civilian population, made it possible for OPA to end its rationing programs for all but sugar and rubber tires before the close of November. Effective at midnight, December 31, tires were also released from rationing, leaving sugar as the sole commodity still subject to ration control. Rationing of processed foods, gasoline, fuel oil, and stoves was terminated immediately after the Japanese surrender, and rubber footwear, canned milk and cheese, automobiles, shoes, and meats, fats and oils in the following two months.

The end of most rationing and the lifting of some price controls enabled OPA to tighten its administrative organization. By the end of the year, the number of paid employees had been reduced to 37,729, compared with a peak of 63,428 in July, 1945; the number of district offices had been reduced to 64 from 93; and the number of local war price and rationing boards had been cut to about 1,900 from 5,600. The cut in local boards also freed a large number of citizens who had voluntarily contributed their time and effort throughout the war and whose outstanding work made possible OPA achievement.

Chester Bowles, who had been Price Administrator since November 1943, remained in that office throughout 1945.

History. The Office of Price Administration was created April 11, 1941, by Executive Order of the President, and was first known as the Office of Price Administration and Civilian Supply. It took over the price stabilization and consumer protection work started by the Advisory Commission to the Council of National Defense, the initial organization set up to direct the nation's armament program (see YEAR BOOKS for 1941, 1942, 1943,

and 1944). The Executive Order directed the price agency to take "all lawful steps necessary or appropriate in order to prevent price spiralling, rising costs of living, profiteering, and inflation resulting from market conditions caused by the diversion of large segments of the nation's resources to the defense program, by interruption to normal sources of supply, or by other influences growing out of the emergency."

The Price Stabilization Division of the National Defense Advisory Commission issued the first maximum price schedule, Feb. 17, 1941, covering second-hand machine tools, prices of which were threatening to skyrocket under war demand. Price schedules for aluminum scrap and secondary aluminum ingot, zinc scrap, and secondary zinc scrap, iron and steel scrap, and other important war materials followed. The creation of the Office of Price Administration and Civilian Supply (which became the Office of Price Administration in the Office for Emergency Management, August 1941) greatly strengthened the authority to issue and enforce maximum price schedules. The Office, by delegation of executive authority, possessed all the powers that had been available to the Price Fixing Committee of the War Industries Board in 1917-18. There was, however, one defect in the Office's power—there were no direct penalties for violations of price schedules. This was corrected on January 30, 1942, when the President signed the Emergency Price Control Act of 1942. The Act, for the first time, gave the Office of Price Administration statutory power, defining its duties to control prices and rents and providing it with specific means to punish violators. Leon Henderson, who had directed price control operations from the start, became the first OPA Administrator. Provided with statutory power and authority to enforce its orders, the Office reissued most of the existing "price schedules," of which there were close to 100, as "regulations" within the meaning of the Act.

On April 28, 1942, OPA issued its General Maximum Price Regulation, which set the highest prices charged in the month of March 1942 as the ceiling prices for virtually everything the American family wears or uses, and for around 60 percent of all foods. On May 11, 1942, the new ceilings became effective at the manufacturers' and wholesalers' levels, and one week later, on May 18, 1942, at the retail level, carrying price control into every store and shop throughout the nation. By the end of April 1942, 323 defense-rental areas had been designated in localities where inflationary rises were appearing. The general practice was to establish as a ceiling for an area the actual rent charged as of the date when the beginning of an inflationary advance was noted. In four-fifths of the areas designated by the end of April, rents were frozen as of March 1, 1942.

The basic weakness in price control after the General Maximum Price Regulation had gone into effect was that it provided ceilings for only 60 percent of foods, due to limitations of the Emergency Price Control Act of 1942. As a result, the cost of living continued to advance, due almost entirely to rises in the prices of uncontrolled foods. Between May and September 1942, foods controlled by GMPR advanced only three-tenths of one percent. In the same period uncontrolled foods advanced 10 percent, and the increase was translated into a 1.6 percent increase in the cost of living. To halt this uptrend, Congress passed the Stabilization Act of 1942, amending the earlier statute, which was approved by the President October 2, 1942. With

this new enabling legislation, price control was extended to provide retail ceilings for 90 percent of all foods. Toward the end of 1942, OPA issued an increasing number of dollar-and-cent maximum prices to replace the "freeze date" prices of the General Maximum Price Regulation or the "formula" maximums which had to be calculated by the seller on the basis of costs.

In the following years, the OPA continued its policy of transferring commodities from the General Maximum Price Regulation to specific regulations and of increasing use of dollar-and-cent prices, thus making the problem of enforcement less difficult. (For the different types of ceiling prices, see YEAR BOOK for 1943.) Compliance with these ceilings was made more effective through the Community Price Program, under which uniform retail prices for most standard groceries are published at regular intervals.

During 1944, controls were extended, particularly in the field of fresh fruits and vegetables, to distribution levels which were formerly uncontrolled. A nation-wide restaurant regulation became effective July 31, 1944. For more than a year previously restaurants had been controlled by regional orders, but the resulting lack of uniformity made compliance difficult. Institution of the national regulation was approved by representatives of the restaurant industry.

Adjustable pricing provisions were inserted in many regulations during 1944 and 1945. These permitted sellers to make sales and deliveries at current maximum prices subject to adjustment upward or downward in accordance with maximum prices subsequently established. This was done to facilitate distribution of commodities during periods when revised price ceilings were being discussed.

The delegation of authority to OPA to ration items made scarce by the war was first made experimentally on December 27, 1941, when hostilities in the Pacific choked off rubber imports from the Far East, and it became clear that automobile tires would have to be equitably distributed to essential users. This rationing authority was generalized and made permanent by Directive No. 1 of the War Production Board, issued January 27, 1942.

Under the general rationing arrangement, the War Production Board determined the quantity of scarce commodities available for civilian consumption except in the case of foods, where the determination was made by the War Food Administration, and in the case of petroleum, where the determination was made by the Petroleum Administration for War. Directives to ration foods were issued to OPA by the WFA, and by WPB as to other commodities. These directives were issued if the supply of a commodity available for civilian use was so limited that it could not be fairly distributed through the usual trade channels.

Tires, automobiles, and typewriters were among the first commodities upon which the impact of war was felt. They were rationed by certificate, as were bicycles. But by the end of 1942, the use of coupon books in rationing was well established. War Ration Book One, put in use in May, 1942, first provided coupons for sugar, then also for coffee. A separate coupon book was issued for gasoline, and coupon sheets were issued for fuel oil.

Point rationing was started early in 1943, with War Ration Book Two for meats and processed foods. War Ration Books Three and Four included point coupons for meats and other commodities. Book Three was distributed by mail June 15—

July 15, 1943, and Book Four through individual registration in October, 1943.

Dates upon which rationing of various products began were: 1942—new tires and tubes, January 5; recapped and recapping tires, February 19; new automobiles, March 2; typewriters, March 13; sugar, April 28; gasoline in 17 Eastern States, May 15; nation-wide mileage rationing, December 1, 1942; bicycles, July 9; rubber footwear, September 29; fuel oil, October 1; coffee, November 29 (released July 1, 1943); coal and oil heating stoves for private dwellings in 30 States, December 18 (nation-wide August 24, 1943). 1943—shoes, February 7; processed foods, March 1; meats, fish, fats, oils, cheese, March 29; canned milk and soft cheeses, June 30; solid fuels in Pacific Northwest, September 20; jellies and preserves, October 31.

OPA conducted a thorough campaign during 1944 and early 1945 to beat the gasoline black market. To reduce thefts from ration boards, central issuing points for coupon distribution were started in a number of cities, and security sites were established throughout the country. Under this procedure coupons were kept under regular banking conditions with necessary safety precautions. Local war price and rationing boards kept only a small store of coupons on hand for emergency purposes. Verification centers were also set up in each region to check ration coupons turned in, to test them for counterfeiting, and finally to see that they would be destroyed completely to prevent their getting into circulation again. In addition, regulations were tightened up to prevent legitimate coupons from reaching black market operators.

The mailing and verification centers were used also to handle other ration currency besides gasoline coupons.

The termination of the gasoline rationing program after V-J Day saw the sudden end of the traffic in illegal coupons and closed the problem of shutting off the flow of counterfeit and stolen gasoline ration coupons. A measure of the effectiveness of this work, as an important part of the well-rounded anti-gasoline black market program of the Office, is to be found in the figures disclosing the total nation-wide circulation of counterfeit gasoline coupons. In November and December of 1944, when the first complete figures became available, the circulation of counterfeits averaged 5,539,647 gallons per month. In July, 1945, the last month of complete figures, the circulation of counterfeits had dropped almost 94 percent to 362,118 gallons, culminating a steady decline in circulation from the end of 1944. The gasoline counterfeit problem had thus been virtually liquidated before the end of rationing.

The extreme shortage of meats during the early months of 1945 led to a meat black market of serious proportions, with counterfeit red stamps widespread. The currency verification centers were useful in attacking this problem also, and an intensive enforcement campaign was carried on which led to numerous arrests and criminal prosecutions both of traffickers in coupons and of business purchasers and users of illegal coupons. The Department of Justice promised immediate and vigorous prosecution of all black market cases, followed by substantial jail sentences.

Except for sugar, all OPA rationing operations ceased by the end of 1945. Removals from control after V-E Day were as follows: New and used 1942 automobiles (July); all stoves, gasoline and fuel oil, processed foods, farm implement and industrial tires (August); firewood and coal in Pacific

Northwest, rubber footwear, some cheeses (September); canned milk, all other cheeses, new automobiles, shoes (October); meats, fats, and oils (November); rubber tires (December 31).

Removed from rationing control during 1944 were: Canned grapefruit, soy beans, and mushrooms, and canned and bottled ready-to-serve soups (January); lard (later restored), dried fruits (March); typewriters, shortening and oils (later restored) (April); citrus juices and frozen foods (June); laundry stoves and ranges (August); bicycles, dried beans, jams and jellies (September); coal and wood stoves (October).

Leon Henderson, who had been OPA Administrator for nearly two years, resigned on January 26, 1943, and was succeeded by Prentiss Brown. On April 8 the President issued the "Hold-the-Line" order under which the four-point program of the Office was announced by the Administrator on April 30 and put into effect during the summer and fall of 1943. On November 8, Mr. Brown resigned and Chester Bowles, who had been General Manager since July, became the third OPA Administrator.

Organization. The OPA Administrator is appointed by the President by and with the advice and consent of the Senate. Assisting him is a Deputy Administrator in charge of operations, a Hearings Administrator, and several policy advisory committees, together with an advisory and operations staff, the latter headed by a deputy administrator for each department of operations. The Hearings Administrator is responsible to the Administrator on all matters relating to the hearing, determination, and review of administrative proceedings for the OPA.

The advisory staff consists of the General Counsel who also acts as a legal adviser to the Administrator; the Economic Advisor, who advises on the economic aspects of the Stabilization Program and the implementation of OPA policy; the Congressional Information Director, who provides continuing expeditious liaison between Congress and OPA; the Industry Advisory Committee Director, who is responsible for the execution and coordination of this program; the Labor Relations Adviser, who clears all issues of labor policy and whose office services the labor policy committees; the Agricultural Relations Adviser, who is concerned with OPA relations with farmers; the Consumer Relations Adviser, who clears consumer problems, the Credit Policy Adviser, who maintains liaison with the Board of Governors of the Federal Reserve System on matters of consumer credit control; and a Veterans' Relations Adviser to give aid on the problems of returning servicemen.

The operations staff consists of the Deputy Administrator in charge of operations, six deputy administrators, each of whom is in charge of a department, and the field offices. To the Deputy Administrator's staff are attached the office of budget and planning, the office of personnel, the office of board management, and the office of administrative services. In addition there are an executive assistant and a number of special assistants to the Administrator who aid in coordinating agency-wide management functions.

The Accounting Department supervises all accounting investigations. It is made up of four accounting divisions—field, industrial, consumer products, services and audits—and a financial reporting division.

The Price Department is responsible for establishing, by regulation or order, maximum price regulations to control commodity and service prices.

It consists of the Office of the Deputy Administrator for Price, composed of several special assistants to the Deputy, the Export-Import Office, a legal division, and seven operating divisions. Each division in turn is made up of smaller units called branches, headed by a price executive or chief. The branches handle administration of pricing for specific groups of kindred items. The price divisions and branches are as follows: Food Price Division (branches: Cereals, Feeds, and Agricultural Chemicals; Grocery Products; Meats, Fish, Fats, and Oils; Wholesale-Retail and Fruit and Vegetable; Poultry, Eggs, and Dairy Products; Miscellaneous Processed Foods; Restaurant Price); Consumer Goods Price Division (branches: Apparel; Appliance and Equipment; Home Furnishings; Housewares and Accessories; Distribution; Leather, Fur, and Fibers; Textiles); Fuel Price Division (branches: Petroleum; Solid Fuels); Industrial Materials Price Division (branches: Iron and Steel; Nonferrous Metals; Building Materials and Construction; Lumber; Metal Mining Analysis); Industrial Manufacturing Price Division (branches: Automotive; Rubber, Chemicals, and Drugs; Machinery; Paper and Paper Products); Transportation and Public Utilities Division (Branches: Transportation; Public Utilities; Service Trades). The branches in turn are divided into sections which handle homogeneous groups of items. Sometimes sections are still further subdivided into units.

The Rationing Department at the end of 1945 was made up of the Office of the Deputy Administrator, a Legal Division, Division of Ration Currency Control (branches: Ration Banking; Reports and Statistics; Inventory Control); and 2 commodity divisions—Tire Rationing and Food Rationing. Food Rationing consisted of 3 branches—Industrial Users; Institutional Users; and Sugar. Each division is headed by a director. Effective January 5, 1946, this department was disestablished, the remaining function of sugar rationing being transferred to a sugar rationing office established in the Price Department.

The Rent Department, headed by the Deputy Administrator for Rent, is organized into a Program Division, an Operations Division, and a Legal Division. Rent control is administered through an office in each of 483 Defense Rental Areas in the United States and Territories.

The Enforcement Department, headed by the Deputy Administrator for Enforcement, consists of the Office of the Chief Investigator, a Litigation Division, and the following enforcement divisions: Apparel and Industrial Materials; Food; Rent and Durable Goods.

The Information Department, which handles public information and education, is headed by the Deputy Administrator for Information. It has an Office of Program Planning and three divisions: Group and Educational Services, Editorial, and Field.

There are 9 regional offices as follows: Region I, Boston, Mass.; Region II, New York, New York; Region III, Cleveland, Ohio; Region IV, Atlanta, Ga.; Region V, Dallas, Texas; Region VI, Chicago, Ill.; Region VII, Denver, Colo.; Region VIII, San Francisco, Calif.; Region IX, Washington, D.C. (Territories and Possessions). In addition, OPA had, at the end of December, 64 district offices and 4 territorial offices which serve as primary points of supervision over the price control boards and the defense rental area offices. During 1945, 9 regional distribution and verification centers were operating for the control of ration currency.

The war price and rationing boards, known

after January 4, 1946, as price control boards, administered the rationing program at the consumer level and served as an ultimate point of contact between OPA and retailers on matters concerning price control. In January, 1945, there were 5,568 such boards, but by the end of the year the number had been cut to about 1,900.

Local boards operate through "panels" established to handle various operating phases of the price and rationing programs. The ration panels issued ration books and ration coupons and certificates direct to the public, determined what extra rations were needed for special cases designated in the regulations, and performed other rationing and administrative functions. The price panels have the important job of securing maximum compliance with price regulations at the retail levels. They help to distribute regulations and explanatory price control material to retailers, hold trade meetings, and perform other educational functions. They also undertake regular surveys of prices and investigate consumer reports of violation. The price panels' responsibility for retail compliance includes such major fields as restaurants, used passenger cars, services, etc. The most important continuing program of the price panel is the work done on retail food price control. Commodity panels, such as automotive panels, restaurant panels, etc. have been set up in metropolitan board areas, where the work-load is heaviest. Authority has also been delegated to the price panels to negotiate with retailers in matters of consumer overcharges and to make recommendations to the district director on settlement of cases of consumer overcharges in which the price administrator has a statutory right of action. On V-J Day 8,337 price panels, with about 75,000 members, were active. By the end of October the number of price panels had been reduced to 6,947. During the year these panels had made almost 4 million visits to retail stores for educational or checking purposes, and had disclosed over a million stores in violation.

Local board members serve without pay. They are selected by State or local defense councils and their names are recommended to the Office of Price Administration for approval.

CHESTER BOWLES.

PRISONS, PAROLE AND CRIME CONTROL. Reconversion.

The war years offered many powerful incentives to men and women in prisons all over the United States to do something tangible and constructive to help win the war. Production of prison industries, the purchase of war bonds, blood bank donations, and other drives gave these isolated persons an opportunity to identify themselves with the problems of a society to which they belonged and must return. The discovery of peacetime equivalents to these wartime incentives is one of the important reconversion problems facing prison administrators today.

Another is the spectre of a "crime wave" which may this time prove to be something more than a mirage created by a few sensational crimes and an hysterical press. All the elements that make for an increase in crime seem to be on the immediate horizon. Large numbers of returning soldiers rightfully proud of their own value but "trigger-happy" and bitter toward shirkers, war-profiteers, and "two-timers"; displaced war-workers, new standards of money values with their inevitable injustices and many other problems of reconversion seem already to be breaking into a storm of lawlessness that will bring serious problems to prison administrators, police and courts.

Prison Population. Up to now, however, these factors have not been translated into any appreciable increase in the prison population. According to Bureau of Census reports the total prison population at the end of 1940 approximated 180,000. In 1943, the prison population had decreased to a little over 131,000 at the end of that year. On Dec. 31, 1944, the prison population showed a further decrease to 127,000. This decrease in prison population during the war years is striking. Whether this tendency has continued during 1945 is unknown, since the prison population data is not available and no estimates have been made.

The probabilities are, however, that the low point has been reached and that the postwar era may witness an equally striking rise in prison population. There are disturbing evidences of those elements previously mentioned precipitating into a genuine crime-wave, particularly in the large metropolitan areas. In the space of 78 days in New York City alone, 69 murders were committed. The rise in juvenile delinquency and the number of youthful offenders has been given wide publicity.

Army and Navy Correctional Programs. Probably the most striking development in the correctional field during 1945 has been the rapid expansion of the correctional programs of both the Army and Navy. As of Nov. 1, 1945, the Army had a total of 34,766 prisoners and the Navy a total of 16,070 prisoners. Faced with inadequate facilities, inexperienced personnel, and an exceedingly rapid rate of commitment, the task of building an adequate program was overwhelming. Unhindered by many traditional restrictions and with the assistance of some of the most prominent leaders in the civil correctional field, the Army and Navy programs soon showed rapid progress. From December, 1942, through Nov. 1, 1945, a total of 16,915 Army general prisoners were honorably restored to military duty. In general, both Army and Navy Corrections Divisions followed the lead of the well established philosophy of individualized diagnosis and treatment, construction and administration of institutions.

After the cessation of hostilities in August, 1945, the War Department formulated a procedure which provided for the reexamination of the sentences of all general prisoners through the operation of special clemency boards. The chairman of the special board that determined its broad policies with respect to the proper sentences for Army cases was first the Hon. Sherman Minton, U. S. Circuit Judge and former Senator from Indiana, and later Mr. Justice Owen Roberts, recently retired from the Supreme Court of the United States. These gentlemen in consultation with high-ranking Army officers have reviewed typical cases of convicted soldiers and recommended to the Secretary of War such revisions in the more or less hastily-imposed sentences of Army Courts-Martial as seemed to them appropriate. These decisions when and as approved by the Secretary of War, establish the bench-marks which will be used by reviewing boards in determining the need for clemency in particular cases.

The Navy's correctional program has gone through a similar rapid growth. The number of general courts-martial prisoners had increased 8000 during the fiscal year to a total of 14,524 and by November 1, 1945 had leapt to 16,070. Paralleling the Army procedures, the Secretary of the Navy established the Naval Clemency and Prison Inspection Board headed by Vice Admiral J. K. Taussig. A review of all cases committed for purely military offenses is being made each six months.

Progress in States. In State prison systems, the year was filled with plans for post-war expansion and improvement in both institutional facilities and programs. A few states began actual operations under new and forward looking legislation.

New York led the States this year in new correctional legislation. Under the laws of 1945, there was enacted a comprehensive and progressive program for improvement in both the field of correctional administration and control of juvenile delinquency. One statute, known as the Youth Act, authorized the establishment of local youth Bureaus, recreation and education projects, and general guidance for the development, protection and security of children. The act also created a temporary State Commission to assist local agencies in preventing juvenile delinquency and to reimburse half the cost of any local community program which the Commission approves.

Another New York statute provides that no child subject to the laws of the Children's Courts may be detained or committed to any jail, penitentiary, or lock-up or in any place where he may come in contact with previous offenders. Recent legislation also provides for a Reception Center at the Elmira Reformatory where all male offenders between the ages of 16 and 21 will be committed by the Courts for diagnosis and designation to the proper institution.

A marked advance in parole was made by the passage of a law unifying the nine separate parole systems in the State under a State Board of Paroles within the Department of Corrections.

The Wisconsin legislature took active measure to improve the treatment of offenders in that state by authorizing a \$600,000 diagnostic center at Madison. The center when constructed will furnish complete information concerning offenders committed by the courts. The center is to be operated jointly by the State Department of Public Welfare and the Medical School of the University of Wisconsin.

The State of Maryland approved legislation to provide indeterminate sentences for offenders between the ages of 16 to 25 years. The Women's Prison and the State Penal Farm will be converted into Reformatories for the incarceration of these youthful offenders. A second law revised the Juvenile Court statute, setting up a probation system, abolishing the jurisdiction of the obsolete Magistrate's Court in juvenile cases, and vesting it in the circuit courts. The age limit of juveniles is raised to 18 years and jurisdiction extends to dependent, delinquent, neglected and feeble-minded children.

This by no means exhausts the list of states active in the improvement of their correctional programs. California, Virginia, Pennsylvania, and Georgia are instances of states which are now building on foundations of legislation laid previously.

Accent on Youth. In practically all plans, programs, and statutes relating to correctional work and in crime control, the most notable element has been the emphasis on the youth. Public pressure for the prevention of juvenile delinquency has made itself felt in concrete ways.

The whole youth problem is highlighted by statistics showing that the age of persons arrested and imprisoned decreased sharply in the past few years. Statistics published by the Federal Bureau of Investigation reveal that in the first six months of 1945, 21.4 percent of all persons arrested were under 21 years of age as compared to 19.2 percent in the first six months of the previous year. Arrests for juvenile girls for crimes against property in-

creased 9.2 percent and arrests for boys for crimes against persons increased 23.8 percent. In the federal prison system the percentage of commitments under 20 years of age rose from 8.5 percent in 1941 to 15.2 percent in 1945.

Selective Service Violators. The problem of the Selective Service Act violators in the Federal prisons became somewhat more acute with the end of the war. At the end of the fiscal year 1945, there were 4,703 such violators in prison, although the commitment rate declined by one-third. Some effort has been made by groups of conscientious objectors for the release of Selective Service violators or for a grant of general amnesty. This has apparently met with little public support.

For nearly four years the Attorney General has been empowered under the provisions of Executive Order 8641 to grant special paroles to Selective Service violators recommended by the Director of the Selective Service System. During the past year 712 such paroles were granted as compared to 847 during the previous three and a half years.

Probation and Parole. This year seems to have been an active year for consideration and passage of legislation in the correctional field. Although much of the legislation proposed dealt with the youthful offender, a good deal of it was devoted to probation and parole. While much of the proposed legislation failed to pass the respective state legislatures the nature of the proposals themselves is significant.

In Colorado, for example, bills were introduced to allow the judge to place persons on probation, without the concurrence of the prosecuting attorney, and to create a State probation and parole system. The National Probation Association prepared the draft of these bills on request of the State Bar Association, but they failed to pass. In Connecticut, bills to establish State-wide administration of adult probation and a youth correction authority were pending in the State legislature.

The Florida legislature failed to pass a bill establishing a juvenile court in each county not having a separate court, to have exclusive and original jurisdiction of dependent and delinquent children under seventeen. The bill also provided for the appointment of a State director of juvenile probation. In Michigan, a little progress was achieved when the prohibition against using probation for persons having been twice convicted of a felony was eliminated.

A bill to establish a State board of adult probation and parole and to authorize the use of probation, parole and suspended sentence was passed by the House in the Montana legislature but killed in the Senate. In Nevada, the powers and duties of the State Board of Pardon and Parole Commissioners were enlarged, giving them the power to employ one or more parole officers.

Among the legislation passed in New York one bill gave the State Board of Parole the power to issue a certificate of good conduct to any person previously convicted in that state of a crime, who thereafter conducts himself in a manner warranting such a grant, and if such conduct has continued for a period of no less than five consecutive years. Persons who hold such certificates or who have been pardoned may have business or professional licenses restored to them. These laws affect the right to receive an alcoholic beverage license, to practise medicine, to be licensed as a private detective, and the franchise to vote.

In Wisconsin, a bill eliminating the necessity for the approval of the Governor, with reference

to paroles granted by the Department of Public Welfare to inmates of the State Reformatory or the Industrial House for Women, became law.

JAMES V. BENNETT.

PROCUREMENT DIVISION. A Division of the U.S. Department of the Treasury which procures supplies and services for the Government and controls the disposition of government property, exclusive of realty. In addition to its usual peacetime activities, the Division now maintains and replenishes stocks of strategic and critical war materials, buys products for Lend-Lease and for relief distribution through the Red Cross. Federal Business Associations located in the larger centers of the United States function as agencies of the Procurement Division to promote cooperation among the local federal activities with the object of effecting economies and increasing efficiency in the transaction of routine business of the Government, as well as assisting in various projects of the Procurement Division as requested. A Price Adjustment Board renegotiated war contracts consummated by the Procurement Division. Director of Procurement: Clifton E. Mack.

PRODUCTION AND MARKETING ADMINISTRATION: An agency of the U.S. Department of Agriculture, created Aug. 18, 1945, which consolidated several existing agencies. It consists of 10 commodity branches, 8 functional branches, a Field Service branch, 4 staff offices, the Commodity Credit Corporation, and the Federal Crop Insurance Corporation. One commodity branch exists for each of the following: cotton, dairy products, fruits and vegetables, grain, livestock, poultry, special commodities, sugar, and tobacco. Each branch is responsible, with respect to the commodities over which it has jurisdiction, for production, adjustment, purchases, subsidies, loans, processing, price support, and distribution. It may establish programs to effect economies in processing and marketing of food. It may cooperate with industry and other agencies of the Department in developing new or substitute products. It supervises market news services and maintains standards by means of inspection and grading. Administrator: J. B. Hutson.

PROTECTION AND SALVAGE OF ARTISTIC AND HISTORIC MONUMENTS IN WAR AREAS, American Commission for. A Commission announced by the U.S. Secretary of State, Aug. 20, 1943, which functions in conjunction with the War Department, State Department, and other government agencies, as well as with various museums, universities, and scholars, for the conservation of works of art and monuments in war areas. It is also charged with the duty of urging the restitution of works of art and archives appropriated by the Axis powers or individuals acting under their authority or consent. The Commission cooperates with similar committees of other countries, or of the United Nations, in furtherance of those objectives. Chairman: Justice Owen J. Roberts.

PROTESTANT EPISCOPAL CHURCH. Many months before V-E or V-J Day the Church through its National Council laid careful plans for its postwar strategy, and on May 1 launched its Reconstruction and Advance Fund. This effort has a two-fold purpose: 1. The creation of appreciation for the missionary work of the Church throughout the world, and the relationship between that work—the establishment of a world-wide Christian fellowship—and a lasting peace. 2. The raising of a minimum

of five million dollars for reconstruction in areas overrun by the war—China, Japan, the Philippines—and for advance in war areas and other strategic centers—among Negroes in the United States, in Latin America, and Liberia, and in the Armed Forces.

The Reconstruction and Advance Fund, without precedent in the Episcopal Church, will reach its climax on February 3, 1946, when every parish in the United States will make an every-member canvass to secure money to carry out the program. By that time it is expected Church people will be better informed about the Church's mission than ever before, as a result of the intensive educational program inaugurated in May, which is a primary purpose of the campaign.

During the closing months of the war, chaplains of the Church served with the Armed Forces, sharing with their men all the hardships and perils of modern war, as is evidenced by these official statistics:

	Army	Navy
Killed in action	6	2
Died from other causes	3	
Decorated for valor	56	9

The chaplains' ministry does not end with the cessation of fighting but continues throughout the days of occupation and peace; often a more difficult task than during actual combat. Nor does the ministry stop with meeting the fighting man's immediate need or problem. In cooperation with the Church at home, chaplains have presented to their men the Church, either in its ordained ministry or its world-wide mission, as a vocation. Many men have already indicated their purpose to make this their life work.

During 1945 changes in the House of Bishops were especially numerous. Twelve new bishops were consecrated, including three Missionary Bishops: R. H. Gooden (Panama Canal Zone), Bravid W. Harris (Liberia), and Arthur B. Kinsolving II (Arizona). The other new bishops with the exception of Thomas H. Wright (East Carolina), William R. Moody (Lexington), Henry I. Louttit (Suffragan, South Florida), and Alfred L. Banyard (Suffragan, New Jersey) were all Coadjutor Bishops: Donald B. Aldrich (Michigan), Conrad H. Gesner (South Dakota), Frederick L. Barry (Albany), C. Avery Mason (Dallas), and John E. Hines (Texas).

Three bishops died during the year: the Rt. Rev. H. P. Almon Abbott (Lexington), the Rt. Rev. Julius W. Atwood (retired, Arizona), and the Rt. Rev. Frank E. Touret (retired, Idaho).

The National Council's Department of Promotion continued to utilize radio and motion pictures as media for proclaiming the Church's message. Its second professional sound motion picture, *Thy Will Be Done*, was released in the autumn and met with instant success. The Religious Film Association accorded it its highest rating. The Department was also taking a leading part in the organization of a Protestant film association for the production of more and better motion pictures. In radio, the Church continued its participation in Columbia's Church of the Air, Mutual's Radio Chapel; stimulated use of local stations; and produced a second series of transcriptions for radio broadcast under the general title, *The Living People*. This series of nine transcriptions was directly related to the Church's annual Every Member Canvass and demonstrated the National Council's use of modern media.

The Church took a leading part in the National Clothing Drives and the Church Christmas Pack-

ages for distressed peoples in Europe and Asia. Through the Presiding Bishop's Fund for World Relief, Episcopalians gave in excess of \$50,000 for the succor of afflicted peoples, and were organizing to participate actively in the material aid programs of the World Council of Churches and the Church Committee for Relief in Asia.

During the year, Church people in the United States received new impressions and deeper understanding of the world-wide fellowship to which they belonged, through visits of distinguished churchmen from overseas. Chief among these were the Bishop of Melanesia, the Rt. Rev. Walter H. Baddeley; the Bishop of Tanganyika; the Rt. Rev. George A. Chambers, Bishop of Chichester; the Rt. Rev. G. K. A. Bell, who came to America for meetings of the Executive Committee of the World Council of Churches; and Dr. Francis C. M. Wei, president of Central China College, who came as the first visiting Henry R. Luce Professor of World Christianity of Union Theological Seminary, New York.

The General Convention, the central legislative body of the Church which meets triennially, will convene for its 55th session on September 10, 1946 in Philadelphia, instead of San Francisco as previously announced. Between sessions of the General Convention, the affairs of the Church are conducted by the National Council.

The headquarters of the National Council, which is the board of directors of the Domestic and Foreign Missionary Society, are in the Church Missions House, 281 Fourth Avenue, New York 10, N. Y. The official magazine is *Forth*, William E. Leidt, Editor. President of the National Council is the Rt. Rev. Henry St. George Tucker, formerly Bishop of Virginia.

The total number of communicants of the Episcopal Church in 7,818 parishes and missions was 1,568,152. Baptized persons numbered 2,269,962. Clergy numbered 6,449, and 209 priests were ordained during the year. In the Church (Sunday) Schools 394,456 pupils were enrolled. Baptisms during the year reached 86,410 and confirmations 68,868.

PSYCHIATRY. Now that the phase of war dominated by armed combat between the Allies and the Axis powers is at an end, the lessons of psychiatric experience may contribute their mite toward an understanding of the human mentality that makes wars possible.

The most humiliating realization of all is the fact that progress—if by progress is meant the attainment of a peaceful way of life devoted to the increase of knowledge and skills and the enhancement of cultural values—has not to date been demonstrated. The concept of progress must in the main be restricted to technological advances. Hitherto man has been more concerned with what he can do than with what he can be. Man's nature is reflected in his behavior, and war making reflects the nature and mentality of the makers of war. Their behavior represents for peace-loving peoples a primitive stage of social evolution.

World War II has not only discounted the idea of social progress on a world scale by exposing the bestial that may be in men, to outward seeming like other men, who come to occupy the seats of power; it has also revealed as never before the nature and quality of the existing human stock as a whole, both its admirable and its regrettable characteristics.

It has been a shock to the public to learn of the huge number of men rejected for military service

because of psychiatric findings; it has been further disturbing to know that even after such extensive exclusions the ratio of discharges from the service because of psychiatric disorders should be so high. Appel (*Amer. Journal of Psychiatry*, Jan. 1946) reports, from data compiled by Selective Service System, that during the period Jan. 1, 1942-June 30, 1945, nearly 1,750,000 men were rejected for service in the Army, Navy, Marine Corps, etc. because of neuropsychiatric disorders. This represented 12 percent of all men examined and 37 percent of those rejected for all causes.

The breakdown of these rejections showed three major groups: mental deficiency 33 percent, psychoneurosis 31 percent, psychopathic personality 21 percent. These figures are approximate.

Coming now to discharges during service we note that separations from the Army for psychiatric reasons fall into two categories: (a) Those granted medical discharge, (b) those classified as non-medical (psychopathic personality, mental deficiency and certain other conditions). During the 3½ year period ending June 30, 1945, there were 320,000 men given medical discharges from the Army because of neuropsychiatric disability (41 percent of all medical discharges). In addition 137,000 men were discharged for psychiatric reasons under a non-medical category, making a total of 457,000 men separated from the Army for neuropsychiatric disorders.

It is pointed out, however, that disability in the military sense is not the same as disability in civilian life, and that accordingly many of those considered unfit for military service were not disqualified for civilian occupations; likewise that of the men discharged for psychiatric reasons many would doubtless never have been recorded as casualties in civil life.

Critics of war psychiatry have not been lacking both without and within the medical profession and in and out of the Army. It has been urged that too many men were exempted from military service because of alleged psychological or personality difficulties, that the very emphasis on psychiatric screening tended to increase the material to be screened, and that too many neurotics and psychopaths were released from the Army instead of being disciplined into good soldiers. A comment on this latter point is the fact mentioned above that 30 percent of the men who failed to become or continue as good soldiers because of psychiatric conditions were discharged on administrative grounds and in a non-medical category.

It has been suggested, for example, that "There were no psychiatric casualties on Malta because there were no psychiatrists." Although there was no service psychiatrist on the island during the siege, Dr. Robin Lees, who was on Malta from February, 1942, to March, 1944, declares (*Lancet*, Jan. 13, 1945) that there were many psychiatric cases. Further, Brigadier Tunbridge reporting (*Lancet*, Nov. 10, 1945) "Psychiatric Experiences of a General Physician in Malta" from September, 1941, to June, 1943, on the basis of routine out-patient medical consultations, states that "approximately 50 percent of all out-patient cases showed evidences of a major psychiatric disorder either primary or secondary." The greater number of these were psychoneuroses which constituted "at least 30 percent of all medical out-patient consultations." These estimates are not very different from those from other theatres. In general the health and morale of the troops were good and their stamina and achievements under conditions of exceptional stress demonstrated uniquely the vital

importance of leadership. It was "He," Field-Marshal Viscount Gort, VC, Governor of Malta, to whom this credit was due.

The main psychiatric problem throughout the war and in every area was the condition called neurosis; its prevention and treatment was the major task of the army psychiatrist, a task shared substantially by every medical officer. In this war particular emphasis was laid upon preventive measures, from initial screening, through training and up to the moment of combat. In these latter stages not only medical officers but also commanding officers and N.C.Os. often played a significant part.

Treatment of war neurosis consisted essentially in some variety of psychotherapy. Two words frequently encountered in the literature are "narco-analysis" (British) and "narcosynthesis" (American). By definition these words should mean opposite processes, but in practice they amounted to the same thing. The method is a combination of the narcotizing effect of a barbiturate administered intravenously, and suggestion, the latter being the key-note of all psychotherapy by whatever name it may be called. When under partial narcosis the patients are encouraged to "abreact," i.e. to talk out their distressing battle experiences. While many patients have undoubtedly been helped by this procedure (Grinker and Spiegel: *War Neuroses*, Blakiston, 1945), it has the disadvantage of any method that tends to become standardized and to be applied indiscriminately to all cases. The prime requisite of psychotherapy is individualization. McNeel points out (*Am. J. Psychiat.*, Jan., 1946) that simpler forms of psychotherapy accomplish equally good results and he is inclined to doubt the general applicability of the abreaction technique. It is the experience of the ages that neurotic symptoms may be relieved by the greatest variety, even the most bizarre, of procedures. The essentials are the personality, authority and manner of the therapist and what may be called the curative atmosphere of the clinical setting in which the treatment is applied. One may peruse with profit Sir Arthur Hurst's letter to the *British Medical Journal* (Mar. 6, 1943) in which he comments upon certain current fantastic theories as to the basis of neurosis and procedures for its relief. "My experience in the war of 1914-18," writes Sir Arthur, "and especially at Seale Hayne Military Hospital for Functional Nervous Disorders with its 350 patients and 10 medical officers, was that the war neuroses responded very well to simple psychotherapy in the form of explanation, persuasion and re-education. . . . A much smaller experience in the present war has not led me to alter my opinion."

Group psychotherapy was rather extensively resorted to in the exigencies of war. This was not a new technique; it had been experimented with in various clinics for a number of years, on the theory that patients with common problems could profit by group discussion of these problems under the leadership of the physician. It was largely the goad of necessity, however, that prompted the use of this procedure among the troops where it served a useful purpose. What place it will take under peacetime conditions remains to be seen. It has aroused sufficient interest to lead to the organization of an American association for the study and promotion of group therapy. A symposium on various aspects of the subject appeared in the *American Journal of Orthopsychiatry* (Oct., 1944).

There has been unfortunately considerable alarmist publicity about the needs of returning

THE "BLACK WIDOW" (P-61) NIGHTFIGHTER IN FLIGHT

Special radar equipment enabled it to spot enemy planes in darkness, and to communicate with home base as well as fellow nightfighters.

A NEAR BY AAF BOMBER SUDDENLY APPEARS ON A PILOT'S SCOPE

By an extraordinary chance, this bomber, out in the blackness, came into the radar beam of a travelling plane—and announced itself. (Official U. S. AAF.)

THE FLYING RADAR SET

THE B-29 IS SOMETIMES REFERRED TO AS A FLYING RADAR SET. THE FUNCTIONS OF FIVE TYPES OF RADAR EQUIPMENT ARE SHOWN HERE

**THE DC-4, COMMERCIAL VERSION OF "SKYMASTER"
ARMY TRANSPORT** (Douglas)

THE B-26, USED IN LOW LEVEL PINPOINT BOMBING
(Glenn L. Martin)

THE B-32, ANOTHER VERSION OF THE SUPERFORTRESS
(Otto Menge—Con. Vultee)

**THE BEARCAT, IMPROVED FORM OF THE NAVY'S
FAMOUS HELLCAT** (Grumman)

**THE GIANT MARS CROSSING GOLDEN GATE BRIDGE
ON THE SAN FRANCISCO TO HONOLULU RUN**
(Glen L. Martin)

THE B-29 SUPERFORTRESS
Carries more faster, farther, higher
than any other plane. (Boeing)

U.S. PLANES AS THE WAR ENDED

THE PILOTLESS "GARGOYLE"

A robot dive-bomber that does 600 miles an hour. (Official U. S. Navy)

THE NAVY'S XFBB-1

A versatile single-engine fighter used as bomber, attack, torpedo, interceptor. (Boeing)

THE "CORSAIR," WITH 8 5-INCH ROCKETS

Also 6 .50 caliber machine guns, a 2,000 pound bomb load, and a speed of 450 miles (United)

THE VICIOUS-LOOKING "GORGON"

A Robot, carrying 1000 lbs. of explosives at 400 miles. Power plant is in ring (Official U. S. Navy)

THE "GLOMB" IS A GLIDER-BOMBER

Guided by television, dives at 300 per hour. (Official U. S. Navy)

RADAR GUIDES THE "BAT"

Navy Privateer patrols can tuck a Bat under each wing and launch outside enemy range.

service men from the standpoint of mental health. Notoriously great wars are followed by social unrest and dislocation in many directions, involving service men as well as others. The recent war is patently no exception. To meet the needs of men from the armed forces, mental hygiene clinics and counselling centers have been set up by the government and local agencies in all parts of the country. Rennie (*Am. J. Psychiat.* Jan., 1945) deals comprehensively with the subject of psychiatric rehabilitation therapy as developed at the New York Hospital. The May, 1945, issue of *Diseases of the Nervous System* is given over entirely to "A Symposium on the Problem of Rehabilitation of Neuropsychiatric War Casualties." That more psychiatrists are needed throughout the country has long been known. Perhaps a greater need is for closer attention on the part of medicine as a whole to the personality of patients and the psychological factors in, and reactions to, illness and disability.

Psychopathic reactions among populations in liberated countries are discussed by Meerloo of Holland (*Lancet*, Apr. 7, 1945). He speaks of the baneful consequences of the long-continued Nazi propaganda infection, plus the effects of fear, starvation and exhaustion. Characteristic and widespread symptoms were a restless apathy and loss of initiative, intense suspiciousness and anxiety, often with aggressiveness. For five years murder, treason, deceit, black markets, perverted bestiality have been part of the real world of childhood, whose demoralization will constitute a serious educational problem. Meerloo comments that as the recovery of social health will be slow, political stability will be delayed.

Nichols (*J. Ment. Sci.*, Oct., 1944) compared the reactions of native African troops with those of the so-called civilized races. When the chiefs were told to supply a certain number of men as soldiers, the men responded as a matter of course. There were no conscientious objectors. Communal consciousness and tribal spirit prevailed. Their behavior as soldiers presented a striking contrast to their previous care-free lethargic village life. When neuroses developed they showed characteristically dramatic sensory and motor symptoms of hysteria, most of which responded fairly promptly to treatment. No case of true anxiety was observed in this primitive race. This was accounted for by their simple, direct and objective mental habits.

Intimately related to the problems of rehabilitation are those of mental hygiene in industry which has been receiving much attention during the past year. A series of articles in *Mental Hygiene* (Jan. and July, 1945) deals with various phases of the subject. All emphasize the importance of consideration for the worker's point of view, of avoiding paternalism on the part of management, of promoting by all and every means the spirit of teamwork and a quality of morale comparable to that of the best led combatant units overseas. The worker should find satisfaction in his work and take pride in his accomplishment over and above its monetary rewards. This involves job analysis.

The incorporation of psychiatry into the medical services of industrial plants is a favorable development. It is not a new phenomenon but has only recently received wider and more serious appreciation. The initial effort to introduce psychiatry into industry on a large scale was made by Anderson for R. H. Macy and Co. in New York City some 20 years ago. This work was continued for several years and was reviewed and discussed by Anderson in the Centennial issue of the *American Journal of Psychiatry* (1944).

Himmler and Eadie have set up mental hygiene programs in two of the General Motors Corporation plants that offer considerable promise. In such a program Himmler (*Ment. Hyg.* Jan., 1945) lays stress upon suitable foreman-worker contacts, to promote which foremen should receive instruction "presented in every-day language, given from a practical, common-sense point of view, tied in with their current problems." The great issue in mental hygiene in industry is the integration of the individual in the social group to which he belongs—the industrial group—with all that the term 'integration' implies. The indications are clear enough but the difficulties are great; for one thing is the fact, as Markuson points out (*Ment. Hyg.*, Jan., 1945), that over 60 percent of the nation's workers are employed in plants with a population of less than 500, in which adequate medical services are lacking.

In entering the industrial field, psychiatry and mental hygiene have to walk warily; they encounter in many quarters the same prejudice and opposition as, principally initially, in the armed forces. It is recalled that Elton Mayo ("Human Factors in an Industrial Civilization") arbitrarily and somewhat self-contradictorily ruled out the need for psychiatrists in industry, insisting that human relations problems in the industrial group are not "mental disorders" and should be handled by foremen and personnel and employment interviewers. With such a statement one may agree in the main, but it is important that personnel workers should be imbued with the principles of interviewing and handling men that the psychiatrist has found to be not merely good but indispensable in his practice. At the same time he will agree with Solby (*Ment. Hyg.* July 1945) that one of the tasks is to differentiate between 'psychoneurosis' and more or less similar behavior patterns resulting from situational maladjustments which may be readily corrected.

It is noteworthy that Cronin, Solby and Wilder (*Public Health Reports*, Nov. 9, 1945) have reported "a mental hygiene program initiated in Government departments and agencies for Federal employees, . . . with basic suggestions for a psychiatric program in industry." The report stems from experience of the mental hygiene unit of the employees' health service, U. S. Public Health Service, in Washington, during its first year of operation (Dec. 1943–Dec. 1944).

The most important move toward resolving the psychiatric problems in industry has been initiated by the National Association of Manufacturers. Having in mind the interests of war veterans and war workers and their re-absorption into peacetime industry, a subcommittee (Chairman C. C. Burlingame) of the medical advisory committee of the NAM spent a year in intensive study in many industrial plants throughout the country. The report of this subcommittee, "Readjustment to Civilian Jobs" (1945) is a sound, comprehensive and conservative statement of the problem, and furnishes a program that bids fair to become standard procedure. A strong point in this report is the note of caution it sounds against exaggerating the problem, "seeing trouble where none exists." This is timely in view of the overplus of alarmist writings about the rehabilitation of war-wracked veterans. The report is one of psychiatry's best contributions to social welfare.

Mental hygiene is making strides in industry; but so long as strikes continue, it still has far to go.

In the clinical field the interrelations of somatic and psychologic factors and symptoms of illness

continue to be widely discussed. Halliday (*Psychosom. Med.*, May, 1945) surveys the incidence in Britain of "psychosomatic affections" during the present century up to the outbreak of war—peptic ulcer and gastritis, psychoneurosis, the hypertensive cardiovascular disorders, diabetes. He found that diseases in which the physical aspects of the environment were highly significant tended to decrease, whereas those in which the psychological features of the environment were of etiologic importance tended to increase. There was an upward trend in the psychosomatic affections during the period surveyed, most marked in the younger age groups. "In peptic ulcer and also perhaps in the hypertensive disorders the upward trend involved males only." Regarding changes in sex incidence Halliday observes: "The diseases which preponderated in females during the late 19th century (peptic ulcer, exophthalmic goitre—also perhaps hysteria and essential hypertension) became manifested increasingly during the 20th century in males, whereas the diseases which preponderated in males (diabetes, suicide) became manifested increasingly in females."

Psychosomatic problems in ophthalmology are the subject of a symposium (*J. Clin. Psychopathol.*, Jan.-Apr., 1945) with eight participants. Hartman insists that more time should be given to eye examinations in order to evaluate the personal side of the case. "Both the ophthalmologists and the patients who come to them with visual symptoms must understand that the eye is not isolated but part of the whole body and to some extent controlled by the psyche." Kronenberg deals with psychogenic factors in disturbances of vision and points to the necessity of close cooperation between ophthalmologist and psychiatrist in such cases. Psychosomatic factors in glaucoma, in disturbances of eye movements, in exophthalmos, in control of pupillary movements and in the function of the lachrymal glands are discussed by other participants.

Among the commoner symptoms for which patients seek medical help are weakness and fatigability, which may be of organic or non-organic origin or both. Allan (*Journal A.M.A.*, Apr. 14, 1945, and *New Eng. J. Med.* Sept. 21, 1944) found from examination of 300 patients with these complaints that 20 percent were attributable to physical causes and 80 percent to nervous conditions. Of the latter he felt that less than 1 of 5 was due to neurosis in the strict sense; a few patients showed simple mental depression; the majority he classified as "benign nervousness," due mainly to unusual stress from extrinsic factors. "The person with 'benign nervousness' feels pleased if told that the examination shows no physical disorder; the neurotic person is disappointed." While all these cases present problems that are psychiatric by definition, most benign nervous conditions should be treated, as the author convincingly points out, by the general physician. Indeed he argues that certain techniques of the specialists may be undesirable. "The fact that a patient has a nervous complaint does not justify intrusion into all the recesses of his private life. . . . Contrary to the idea, currently popular, that past emotional and psychologic trauma should be brought to light, it should be asserted that it is often better to avoid such remembrance." This view of an internist at least deserves consideration.

The subject of geriatrics, dealing with disabilities of the aging process in which mental conditions play so large a part, is gradually and belatedly receiving greater attention. An entire number of

Neurônio (São Paulo, Brazil, Apr., 1945) is devoted to a symposium on the subject consisting of 32 abstracts of articles ancient and modern from various countries prepared by Carvalho Ribas.

In recent years preoccupation with psychopathology and somatopsychic problems has meant comparative neglect of the field of neuropathology

STATE RECORDS IN EUGENIC STERILIZATION

which held out so much promise in the late 19th and early 20th centuries. The field has greatly expanded however and this basic study is as modern today as the shock therapies. No longer limited mainly to the gross and microscopic anatomy of dead tissues, the present status of neuropathology

as a composite discipline in which investigations in structural pathology, experimental pathology and experimental physiopathology of the nervous system all play their parts in elucidating psychiatric problems, is clearly set forth by Ferraro (*Psychiat. Quart.* Apr. 1945).

Finally a word about eugenic sterilization. This measure designed primarily for the limitation of mental defect is discussed by Gamble (*Am. J. Psychiat.* Nov. 1945) from the standpoint of the spread of state legislation. The oldest law that has remained in effect to date was passed in California in 1909, and that State has applied it in the greatest number of cases—16,332 to Jan. 1, 1944 (nearly 40 percent of the 41,928 reported for the United States).

Twenty-nine states now have sterilization laws. On the basis of the total number of cases per 100,000 population to Jan. 1, 1944, Delaware has been the most active state (238 sterilizations). Now follow California (221), Virginia (169), Kansas (158), Oregon (145), N. Dakota (112), S. Dakota (103), New Hampshire (98). The least active states were Georgia (9), Alabama (8), S. Carolina (4), Arizona (4), Idaho (3), W. Virginia (2).

CLARENCE B. FERRARO.

PSYCHOLOGY. The American Psychological Association, The American Association for Applied Psychology, and several other organizations of professional psychologists have consolidated to advance psychology as a science and a profession. Common business functions have been delegated to a central executive office, but the various interest groups retain autonomy in their separate divisions. The new organization bears the name of the American Psychological Association. Every region and every division has a representative in the governing council.

Among new books are: *Psychology for the Armed Services*, edited by E. G. Boring (Washington, D. C.: Infantry Journal); *Experimental Psychology: A Study in Method* by E. Greenwood (New York: King's Crown Press); *The Whole Man* by C. N. Bittle (Milwaukee: Bruce); *History of Psychology from the Standpoint of a Thomist* by R. E. Brennan (New York: Macmillan); *Psychology for Nurses* by B. V. Cunningham (New York: Appleton-Century); and *Psychology: Principles and Applications* by T. L. Engle (Yonkers, N. Y.: World Book), a text for secondary students. *Psychology of Invention in the Mathematical Field* by J. Hadamard (Princeton Univ. Press) analyses the creative thinking processes.

Physiological Psychology. M. B. Arnold finds evidence that there are "at least three different physiological states corresponding to three different emotions: fear, with predominantly sympathetic excitation; anger, with strong parasympathetic excitation; and excitement, with moderate parasympathetic," the latter being the most favorable condition for activity. Color difference thresholds over the entire spectral range can now be measured by a grating spectrometer. This method has demonstrated large individual differences in persons of "normal" color vision. G. A. Fry, P. Moon, and D. E. Spencer have proposed new theories of color vision. K. U. Smith reports recent clinical and surgical findings regarding contralateral hemispheric control of motor functions. Sectioning the corpus callosum and other commissural pathways of the forebrain resulted in only slight and insignificant changes in handedness, eyedness, etc. Speech appeared to be independent of the inter-cortical integrations in the patients operated.

T. C. Barnes and R. Beutner have produced artificial electrical brain waves by bringing acetylcholine into contact with brain extract.

Childhood and Parenthood. A. L. Baldwin, J. Kalhorn, and F. H. Breese report an objective study of parent behavior and its effects on child development. They point out that parent behavior depends both on the emotional attitude of the parent and on his philosophy of child care; parents of mediocre intelligence, limited education, and low social status are likely to be authoritarian. Children in acceptant-democratic homes show significant gains in I. Q. over a three-year period. The democratic home favors the development of originality, planfulness, patience, and curiosity. Actively repressed and rejected children develop a highly emotional nonconformist attitude. In many instances, parents' emotions run counter to their avowed philosophy. When child care has interrupted a prestige-bringing career, motherhood may be a frustrating experience and the child profoundly rejected. Satisfactory emotional relationships do not, however, guarantee adequate methods of handling children, especially in a culture where authoritarianism is traditional. Courses in child care in high schools might improve child care.

Among new books are: *Practices of Parents in Dealing with Preschool Children* by G. G. La Fore (Teachers College, Columbia); *Social Concepts and the Child Mind* by H. Ordan (New York: King's Crown); and *A Workbook in Child Development* by G. E. Schlessler (Philadelphia: Saunders) with a teachers' guide. *The Embryology of Behavior: the Beginnings of the Human Mind* by A. Gesell and C. S. Amatruda (Harper) extends the authors' normative picture of behavior backward into the prenatal period, as observed in prematurely born infants.

Personality and Character. O. H. Mowrer and A. D. Ullman propose a rational explanation of the puzzling fact that living organisms, including people, sometimes persist in behavior which is more punishing than rewarding. They find that the timing of consequences is often the deciding factor. If punishing effects are too long delayed, they are not effective in inhibiting the behavior.

In *The Cultural Background of Personality* (New York: Appleton-Century), R. Linton points out that the interaction of the individual with his society and culture is responsible for most of his behavior patterns, the favorable and unfavorable responses from others being the most frequent incentives. *The Unknown Murderer* by T. Reik, translated by K. Jones (New York: Prentice-Hall), is a psychoanalytic study of the judicial process and the factors which make for false convictions. *Cooperation in Crime Control*, edited by M. Bell, is the yearbook of the National Probation Association. S. J. Holmes points out that altruism is not derived from egoism but is as old as life itself. In social animals especially, altruism is a deep-seated trait and plays an important part in the struggle for life. G. A. Kimble has studied differences between Rorschach records obtained in the laboratory and those obtained from the same group of students in the social atmosphere of a cafeteria, where color responses increased. *Large Scale Rorschach Techniques* is a manual for the group Rorschach and multiple choice test by M. R. Harrower-Erickson and M. E. Steiner (Springfield, Ill.: C. C. Thomas). W. Goldfarb has devised an Animal Association Test as an aid in interpreting the symbolic significance of animal responses in the Rorschach. L. Wekstein offers new stimulus

pictures for fantasy projection tests. *Women and Men* by A. Scheinfeld (Harcourt, Brace) attempts a description of human sex differences, biological, social, and psychological. Among other new books are *Psychology of Sex Relations* by T. Reik (Farar & Rinehart) and *The Psychology of Women*, vol. 2 *Motherhood* by H. Deutsch (New York: Gruene & Stratton).

Clinical Psychology and Related Fields. Clinical psychologists are making increasing use of the client-centered, "nondirective therapy" first developed by C. R. Rogers. J. B. Dynes and F. J. Hamilton report successful group therapy of psychiatric war casualties. J. E. Finesinger and E. Lindemann point to the need for a "de-doctrination program" for discharged veterans. *Psychology for the Returning Serviceman*, edited by I. L. Child and M. Van de Water (Washington, D. C., New York: Infantry Journal, Penguin Books) deals with readjustment to civilian status. A. Schuetz points out that the homecomer who hopes to reestablish old intimate we-relationships is disappointed because both he and the welcomer have changed, and both have built up pseudo-types of each other. *Rehabilitation of the Disabled Serviceman* (Russell Sage Foundation) is a bibliography on services for handicapped veterans. G. Klopff has also prepared a bibliography on the adjustment of World War II veterans. J. B. Dynes contends that hospitals tend to hold convalescents too long, thereby inducing a dependency reaction. Aptitude training followed by a real job is the cure. Pioneer work in military hospitals has had good results, and they may become the proving ground for a broad rehabilitation program in civilian hospitals. Stanford University has undertaken research on the social rehabilitation of the physically handicapped. Though emphasis is on the war handicapped, civilians are included also. F. Heider and C. M. Heider report a study of the adjustment of the adult deaf. According to J. C. Howard, Jr., this World War will leave 250,000 servicemen with impaired hearing. Some cases involve only high-tone loss, others low-tone loss, others all frequencies. Threshold values at each frequency must be measured so that the amplifying system will compensate for all irregularities in each individual. L. V. Kingsley and R. M. Hyde have studied selectees rejected for failure to meet mental and literacy standards. They find alcoholism no more prevalent among defectives than among normals, and most defectives seemed to compare favorably with normals in their ability to support themselves. L. H. Snyder, M. D. Schonfeld, and E. M. Offerman find evidence that some isolated cases of feeble-mindedness in highly intelligent families may be due to the conception of Rh plus children by Rh negative mothers, resulting in prenatal injury caused by Rh immunization. Discussing the problems of senescence, G. Lawton points out the desirability of giving old people real jobs, real family relationships, and a real function in society. Lawton says, "Whenever knowledge of tactics, of various ways of doing things is important, then it is that the older person is valued. The older doctor or lawyer, the craftsman, the political leader, the artist in living—all these can more than hold their own in competition with young people."

The Psychology of Diet and Nutrition by L. S. Selling and M. A. S. Ferraro (New York: Norton) discusses child feeding problems, food faddists, dieting, and institutional and group feeding. P. T. Young and J. P. Chaplin, studying appetite in rats, find evidence that it is determined by or-

ganic needs. *Manual for the Study of Food Habits* is a Report of the Committee on Food Habits of the National Research Council, C. E. Guthe, Chairman. J. H. Masserman finds that "alcohol, in moderate doses, disorganizes complex, recently learned response patterns, whether normal or neurotic, and thereby releases earlier and more elemental forms of goal-directed behavior. These ameliorative effects of the drug are sometimes sought by animals that have experienced them." *Alcohol, Science, and Society* contains 29 lectures with discussions as given at the Yale Summer School of Alcohol Studies (New Haven: Quart. J. Stud. Alcohol).

Among new books are: *Mental Disorders in Later Life* by O. J. Kaplan (Stanford Univ. Press); *Techniques of Guidance, Tests, Records, and Counselling in a Guidance Program* by A. E. Traxler (Harper); and *Frontier Thinking in Guidance*, edited by J. R. Yale (Chicago: Science Research Associates). *Marriage and Family Counselling* by S. E. Goldstein (New York: McGraw-Hill) is a general manual for ministers, doctors, lawyers, teachers, social workers, and others. *Patients Have Families* by H. B. Richardson (New York: Commonwealth Fund) views the family as the unit of illness and of treatment. *The Journal of Clinical Psychology*, recently established, is edited by F. C. Thorne (Burlington, Vt.: Free Press).

Measurement and Evaluation. There is a growing tendency to replace the term "psychological measurement" with "evaluation." L. L. Thurstone contends that "the general use of a single index of intelligence such as the intelligence quotient should be discontinued." Instead, he suggests describing each individual in terms of a profile of abilities "that have been found experimentally to be truly fundamental and independent, including verbal comprehension (V), word fluency (W), number facility (N), memory (M), visualizing or space thinking (S), perceptual speed (P), induction (I), and speed of judgment (J)." J. C. Flanagan reports that in the AAF a battery of aptitude tests was found more useful than general intelligence level. Among new books are: *The Application of Measurement to Health and Physical Education* by H. H. Clarke (Prentice-Hall); *On Measurement of Motor Skills: An Approach through a Statistical Analysis of Archery Scores* by E. M. Schroeder (King's Crown Press), and *Intelligence and Its Deviations* by M. Sherman (Ronald).

Education. *Group Planning in Education* by P. J. Misner and others is the Year Book of the Department of Supervision and Curriculum Development of the National Education Association. The authors maintain that "As the child develops in the school's social groups he must experience ever-widening opportunities to be genuinely valuable to other people." "The awarding of prizes, distinctions, and honors works against . . . the development of characteristics essential to intelligent social action." According to N. Greener and L. Rath, the curriculum should be one in which the children are striving to solve problems and find reasons, and the teacher should be learning along with the children. W. A. Brownell points out the importance of teaching meanings in arithmetic from the beginning, because meaningful arithmetic is more easily learned, better retained, and more easily rehabilitated, and it is only meaningful arithmetic that can function in intelligent living. From a survey of the literature on reading, K. H. Burkart finds 214 abilities which various specialists have thought to be involved in the reading process. G. Hildreth finds evidence that mixed dominance is not a pre-

vailing factor in reading difficulties. *An Index to Professional Literature on Reading and Related Topics* by E. A. Betts and T. M. Betts (New York: American Book) includes 8,278 references. The authors emphasize first teaching rather than remedial reading but find that studies at secondary and college levels are also of growing importance. *Reading Difficulty and Personality Organization* is by E. Gann (King's Crown). G. Hildreth finds indirect experimental evidence that manuscript writing can become as rapid as cursive writing. H. A. Edgerton and S. H. Britt report that annual surveys are being made of the social, physical, and professional development of all entrants in the first and second Science Talent Searches. Various educators have noted desirable and undesirable features of army training methods. It seems possible for professional educators to learn something from both the good and the bad features of the army programs. On the desirable side, T. J. Abernathy finds the following factors: a precise statement of objectives, content of instruction limited to essentials for attaining these objectives, and emphasis on learning by doing. H. W. Bailey and K. M. Dallenbach report a study of selective procedures and educational achievement of ASTP trainees. They conclude that "it is easy to overestimate the amount of acceleration that is feasible even with superior students."

Industrial Psychology and Personnel Work. "If the factory can become a place where human beings live a social as well as an economic life," says W. B. D. Brown, "then the normal incentives which operate in the home, in the village, or in the club will begin to operate within the factory. If that time should come to pass, then work itself may some day become something that is looked forward to as an activity to be enjoyed." R. English has devised a self-analysis check list for office managers and supervisors with regard to their procedures in handling employees. According to L. E. Himler, the good foreman must be a psychotherapist, though an amateur. E. Freeman offers a program for the improvement of vision in industry, in which families of visual skills are to be correlated with job families. Among new books are *Vocational Interest Patterns* by I. Wightwick (Teachers College, Columbia); *Employment Tests in Business and Industry* by H. C. Benjamin (Princeton Univ., Industrial Relations Section), an annotated bibliography; *Personnel Work in Schools of Nursing* by F. O. Triggs (Saunders); *Personnel Relations: Their Application in a Democracy* by J. E. Walters (Ronald), and *Employee Counselling: A New Viewpoint in Industrial Psychology* by N. Canton (McGraw-Hill).

Social Psychology. *Human Nature and Enduring Peace* by G. Murphy and 58 other psychologists is the 3d Year Book of the Society for the Psychological Study of Social Issues. It views frustration as the cause of wars and offers a positive program, including "world-minded education." 2,038 psychologists signed "the psychologist's manifesto," a 10-point statement, which may be summarized as follows: 1. War can be avoided. No race, nation, or social group is inevitably warlike. The frustrations and conflicting interests which lie at the root of aggressive wars can be reduced and redirected by social engineering. 2. In planning for permanent peace, the coming generation should be the primary focus of attention. 3. Racial, national, and group hatreds can be controlled. "Prejudice is a matter of attitudes, and attitudes are to a considerable extent a matter of training and experience." 4. Condescension toward "inferior" groups

destroys our chance for a lasting peace. 5. Liberated and enemy peoples must participate in planning their own destiny. 6. The confusion of defeated people will call for clarity and consistency in the application of rewards and punishments. 7. If properly administered, relief and rehabilitation can lead to self-reliance and cooperation; if improperly, to resentment and hatred. 8. The root desires of the common people of all lands are the safest guide to framing a peace. 9. The trend of human relationships is toward ever wider units of collective security. 10. Commitments now may prevent postwar apathy and reaction.

Twenty-two social scientists representing diverse fields collaborated on *The Science of Man in the World Crisis* edited by R. Linton (Columbia Univ. Press). In *Conscience and Society: A Study of the Psychological Prerequisites of Law and Order* (New York: Emerson), R. West contends that understanding, not conscience, is at fault in producing wars and that international law is needed. R. Stagner advocates a reasonable rather than a vengeful peace, and points out that techniques of psychological warfare should not be allowed to foster attitudes which may later interfere with postwar organization. *Germany Between Two Wars* is a study of propaganda and war guilt by L. M. Fraser (Oxford Univ. Press). Among other new books are *The Psychological Frontiers of Society* by A. Kardiner, R. Linton, C. Du Bois, and J. West (Columbia Univ. Press); *The Governing of Men* by A. H. Leighton (Princeton Univ. Press); *Main Springs of Civilization* by E. Huntington (New York: Wiley); *The Use of Personal Documents in History, Anthropology, and Sociology* by L. Gottschalk, C. Kluckhohn, and R. Angell (Soc. Sci. Res. Coun. Bull., 1945, No. 53); *The Social Theory of James Mark Baldwin* by V. D. Sewny (King's Crown); and *The Sociology of the Family* by M. C. Elmer (Ginn). *The Neurologist's Point of View: Essays on Psychiatric and Other Subjects* by I. S. Wechsler (New York: Fischer) discusses many problems including racial psychology, anti-Semitism, colonization, and history of psychiatry. *Plainville, U. S. A.*, by J. West (pseud.) (Columbia Univ. Press) describes in non-technical language an anthropological study of a small contemporary American rural community. *The Journal of Social Issues*, started this year by the Society for the Psychological Study of Social Issues, devoted its first two issues to racial and religious prejudice in everyday living.

MABEL F. MARTIN.

PUBLIC BUILDINGS ADMINISTRATION (PBA). An agency of the U.S. Government under the jurisdiction of the Federal Works Agency. It is responsible for the administrative, technical, and clerical functions incident to the design, construction, maintenance, and repair of federal buildings. The Emergency Operations Unit builds federally constructed schools, hospitals, and health buildings under the War Public Works Program. The Administration is awaiting Congressional authorization of a large program of needed construction of post offices, court houses and other Federal buildings. Commissioner in 1945: W. E. Reynolds.

PUBLIC FINANCE. The end of World War II and the initial stages of the postwar transition were reflected in wide fluctuations in public finance. Federal expenditures reached an all-time peak in June, 1945, when they aggregated \$9,641,000,000 for one month. War expenditures reached their peak in March, and declined very rapidly begin-

ning with July. In the closing months of the year, federal outlays were less than half the June level.

While the precipitant contraction of expenditures during the second half of the year was the outstanding fiscal development of 1945, several other events occurred which are bound to influence federal financial policy for some time to come. The resignation of Henry Morgenthau, Jr. as Secretary of the Treasury and the appointment of Judge Fred M. Vinson to that post was widely interpreted as an indication that a more conservative fiscal policy would prevail for the future. With his long career in Congress, Judge Vinson was expected to reflect more closely the viewpoint of the legislative branch of the Government, and to be less interested in utilizing fiscal policy as a weapon for social reform. As regards the policy of low interest rates, however, Mr. Vinson soon made it clear that he saw eye to eye with his predecessor, and that he favored a low interest cost on the huge federal debt as a means of keeping down the total of peacetime government expenditures.

The Truman Administration appeared determined, furthermore, to limit American financial commitments abroad. The President halted Lend-Lease abruptly when Japan surrendered, and while a large dollar credit to Britain was negotiated in the closing weeks of the year, it was evident that the Government was not going to pour out funds indiscriminately, and without provision for repayment, for postwar reconstruction and development abroad.

Before the end of 1945, Secretary Vinson predicted that the budget would be balanced in the course of the fiscal year beginning July 1, 1946. To this end, he urged that Congress proceed cautiously in tax reductions, and that unnecessary Government expenditures be avoided.

Federal Expenditures. Total expenditures for the fiscal year ended June 30, 1945, were \$100,405,000,000, the highest ever recorded. Of this total, war activities alone accounted for \$90,029,000,000, and general expenses of Government \$8,730,000,000. Veterans' Administration and Social Security outlays absorbed \$1,646,000,000.

Outlays for the fiscal years 1944 and 1945, and estimates for the 1946 fiscal year, are shown in Table I.

TABLE I—EXPENDITURES FOR THE FISCAL YEARS 1944, 1945 AND 1946 (ESTIMATED)
(In millions of dollars)

	Actual 1944	Actual 1945	Estimated 1946
War Activities			
War Department	49,242	50,337	27,997
Navy Department	26,538	30,047	14,700
Miscellaneous war activities	11,259	9,645	6,103
Total war activities	87,039	90,029	48,800
Veterans' Administration	730	2,060	3,402
Public works	438	323	694
Aid to agriculture	909	782	640
Social Security program	803	815	931
Refunds of taxes	202	1,707	2,707
Other	958	1,092	5,470
Interest on the public debt	2,609	3,617	4,750
Total Expenditures	93,744	100,405	67,394

For the fiscal year 1945, the largest proportionate increase in war expenditures was by the Navy Department. Its outlays for the year were \$30,047,000,000, as compared with \$26,538,000,000 in the preceding fiscal year. War Department outlays aggregated \$50,337,000,000, as compared with \$49,242,000,000 in the 1944 fiscal year. The United States Maritime Commission's huge mer-

chant shipbuilding program passed its peak in 1944, expenditures through the Maritime Commission aggregating \$3,227,000,000 in the 1945 fiscal year, as compared with \$3,812,000,000 in 1944. War Department outlays declined from \$4,664,000,000 in June to \$2,476,000,000 in December. Navy Department expenditures fell from \$2,724,000,000 in May to \$990,000,000 in December. Maritime Commission spending fell from \$277,000,000 in June to \$44,000,000 in the final month of the year.

NET BUDGETARY EXPENDITURES AND DEFICIT, 1945

Line indicates 3-month moving average

While war spending declined very sharply beginning with the summer of 1945, general expenditures of the Government increased. General expenditures and transfers to trust funds for the fiscal year ended June 30, 1945, were \$10,376,000,000, as compared with \$6,705,000,000 the year before. The chief factor in the increase in general expenditures has been the rise in interest paid on the public debt, resulting from the very great increase in the size of the debt during the war. Interest on the public debt aggregated \$3,617,000,000 in the 1945 fiscal year, as compared with \$2,609,000,000 the year before. A special factor that stepped up general expenditures sharply in the 1945 fiscal year was the large item for "refunds of taxes" representing the excess profits tax refund bonds issued before the enactment of the Tax Adjustment Act of 1945. The Veterans' Administration spent \$2,060,000,000 in 1945, as compared with \$730,000,000 in 1944, and further increases in this item are inevitable. General expenditures and transfers to trust accounts other than those of the Veterans' Administration, interest on the public debt and tax refunds were \$2,992,000,000 in 1945, as compared with \$3,104,000,000 the year before.

With a high level of business activity widely anticipated, Congressional resistance to some types

of expenditure and a relatively more conservative Administration in office, the end of the post-war transition period may witness a level of federal expenditures substantially lower than had been expected by many. Even with interest on the public debt of about \$5,000,000,000 a year and heavier veterans' benefits, a reduction in federal outlays to less than \$25,000,000,000 a year may not be an unreasonable expectation. In the fiscal year ended June 30, 1941, federal expenditures were \$12,711,000,000. While interest, Veterans' Administration and defense expenditures are bound to remain substantially higher than the 1941 level, other types of outlays such as aid to agriculture, public works and relief could decline far below the 1941 level over the next few years.

Federal Revenues. The receipts of the Federal Government in the 1945 fiscal year rose to \$47,740,000,000, the largest ever recorded. These receipts compared with \$45,408,000,000 in the preceding fiscal year. As in 1944, receipts in 1945 were somewhat above 47 percent of total expenditures. The chief sources of the Treasury's receipts for the fiscal years 1944 and 1945, and an estimate for the fiscal year beginning July 1, 1945, are shown in Table II.

TABLE II—RECEIPTS FOR THE FISCAL YEARS 1944, 1945 AND 1946 (ESTIMATED)
(In millions of dollars)

	Actual	Actual	Estimated
Receipts			
Internal Revenue:			
Income and profits taxes	34,855	35,173	27,221
Employment taxes	1,739	1,780	1,569
Miscellaneous internal revenue	5,291	6,949	7,320
Customs	431	355	413
Other receipts	3,292	3,483	3,183
Total Receipts	45,408	47,740	39,707
Less:			
Amounts transferred to Federal Old-Age and Survivors Insurance Trust Fund	1,260	1,283	1,098
Net Receipts	44,149	46,457	38,609

The yields from major taxes in the 1944 and 1945 fiscal periods are shown in Table III.

TABLE III—FEDERAL TAX COLLECTIONS
(In thousands of dollars)

	1944	1945
Individual income	18,281,005	19,034,313
Corporation income	5,284,145	4,879,716
Excess profits	9,345,198	11,003,520
Miscellaneous profits	137,452	143,978
Capital stock	380,702	371,999
Estate	473,466	596,137
Gift	37,745	46,918
Alcoholic beverage	1,618,045	2,309,864
Tobacco	988,483	932,145
Stamp taxes	50,800	65,528
Manufacturers' and retailers' excises	728,694	1,208,616
Selective sales	1,075,401	1,430,428
Customs	431,000	365,000
Total taxes	39,412,136	43,176,162
Employment taxes	1,738,372	1,779,177
Total taxes and so-called employment taxes	41,350,508	44,955,339

With the decline in expenditures following the end of the war, pressure for lower taxes has become overwhelming. The Tax Adjustment Act of 1945 effected a reduction in receipts which was more nominal than real, since this law merely eliminated the 10 percent postwar refund feature of the excess profits tax and accelerated benefits to

corporations from the carryback of unused excess profits tax credits and operating deficits.

The Revenue Act of 1945 is scheduled to reduce receipts by \$5,930,000,000 for the calendar year 1946, but it did not affect Treasury revenues in 1945. The high wartime tax structure will probably be reduced gradually over a period of years, particularly if prosperous business conditions maintain yields at a high level, as occurred during the '20s.

Treasury Financing. The public debt of the United States increased by \$57,679,000,000 during the 1945 fiscal year. Since the Treasury's General Fund increased by \$4,529,000,000 during the fiscal year, not all of the money borrowed was spent during that period. On June 30, 1945, the national debt aggregated \$258,682,000,000. The several types of obligations outstanding, with comparable amounts for June 30, 1944, are shown in Table IV.

TABLE IV STATEMENT OF THE PUBLIC DEBT
(In millions of dollars)

	1944	1945
Public issues:		
Interest-bearing debt:		
Marketable issues:		
Treasury bills	14,734	17,041
Certificates of indebtedness	28,822	34,136
Treasury notes	17,405	23,497
Treasury bonds	79,244	106,448
Postal savings and other bonds	196	196
Total Marketable Issues	140,401	181,319
Nonmarketable issues:		
U S savings bonds	34,606	45,586
Treasury notes—tax and savings series	9,557	10,136
Adjusted service bonds	217	
Depository bonds	474	505
Total Nonmarketable Issues	44,855	56,226
Total interest-bearing public issues	185,256	237,545
Matured debt on which interest has ceased	201	269
Debt bearing no interest	1,259	2,057
Total public issues	186,716	239,871
Special issues	14,287	18,812
Total public debt outstanding	201,003	258,683

Although war expenditures declined sharply during the second half of 1945, the Treasury launched a final Victory Loan late in the year. The Seventh War Loan, the only other drive during the calendar year and the last for the war period, was conducted between May 14 and June 30. While its goal was only \$14,000,000,000, actual sales aggregated \$26,300,000,000. In this most successful of the war loan drives, sales of Series E savings bonds aggregated \$4,000,000,000, and all other obligations to individuals \$4,700,000,000. Sales to corporations and financial institutions aggregated \$17,600,000,000. The demand for long-term obligations was particularly heavy, because of premiums at which older long-term issues were quoted in the market and doubt that the future supply of such issues would be adequate to satisfy the demand.

The goal for the Victory Loan was set at \$11,000,000,000, with sales to individuals extending from October 29 through December 8, while sales to other investors were concentrated in the period December 3–8. Like the war loan drives, the Victory Loan was heavily oversubscribed, with the result that the Treasury cash balance was lifted well above \$25,000,000,000 by the close of the calendar year. Armed with this huge General Fund, the Treasury was in position to cover the

greatly reduced budget deficit and to redeem war savings bonds and other maturing obligations for some time without new financing. In fact, for the first time since 1931, the Treasury was in position to reduce the public debt in 1946 from the rec-

TABLE V—OWNERSHIP OF U. S. GOVERNMENT SECURITIES
JUNE 30, 1945
(In millions of dollars)

* Less than \$500,000.

ord total of \$278,115,000,000 at which the national debt stood on December 31, 1945.

The outstanding feature of the Treasury's public debt management policy during the year was the increasing emphasis placed on certificates of indebtedness as a financing medium. The volume of Treasury bills outstanding was stabilized a little above \$17,000,000,000, with weekly offerings of \$1,300,000,000 of 91-day notes. The Federal Reserve banks absorbed the larger part of the bills outstanding, using this means to maintain liquidity while expanding their holdings of Government obligations to provide added reserves to member banks. Certificates of indebtedness were issued in greatly increased amounts, not only as part of the war loan drives, but also in exchange

TREASURY WAR FINANCING
SOURCES OF FUNDS RAISED

WHERE THE WAR MONEY CAME FROM

for maturing certificates, notes and bonds. Through greater use of certificates of indebtedness bearing a 7/8 percent interest rate, the Treasury is in position to keep down the average rate of interest, despite large issues of longer-term, higher-coupon obligations. The computed annual rate of interest on the national debt, which reached a low point of 1.919 percent in December, 1944, increased during 1945, reaching 1.965 percent in December. This gradual rise in the average interest rate provided an added incentive to the Treasury for using short-term obligations to a greater extent.

Through huge purchases of certificates of indebtedness, and the acquisition of longer-term securities in the open market, commercial banks

again added heavily to their holdings of Government securities and thus facilitated Treasury financing. In the fiscal year ended June 30, Federal Reserve banks increased their holdings of Government obligations by \$6,893,000,000 and commercial banks by \$15,500,000,000. The Federal Reserve and commercial banks combined thus absorbed approximately 39 percent of the increase in the public debt during the fiscal year 1945.

Table V shows the ownership of various types of Government securities on June 30, 1945, as reported by the United States Treasury.

As the year came to an end, financial circles throughout the country were deeply concerned with the postwar financing policy of the Treasury.

While no further increase in the public debt was in prospect for the near-term future, huge obligations were scheduled to mature. Maturities in the calendar year 1946, as of the end of 1945, were \$73,183,000,000, and in 1947, \$7,057,000,000, through sales of lower coupon issues, the Treasury could reduce further the cost of carrying the public debt. By continuing to favor sales of certificates of indebtedness, the outstanding supply of longer-term issues could be reduced, thus raising their prices and permitting a reduction in coupon rates on such issues. Spokesmen for banks and insurance companies decried such a policy, on the ground that it would encourage banks to hold too large a part of the public debt and would artificially depress the whole structure of interest rates.

Government Corporations. While government-owned corporations have been obtaining their funds directly from the Treasury in recent years, instead of issuing obligations of their own as formerly was the case, the size and scope of their operations have expanded greatly during the war. Congress enacted late in 1945 the Government Corporation Control Act, with the unanimous approval of both Houses. This law provides for an annual audit of the books of government corporations by the General Accounting Office. Wholly-owned corporations of the Federal Government, excepting the Tennessee Valley Authority, will have to submit annual budgets to Congress for review, revision, and possible rejection.

Furthermore, this law calls for specific authorization by Congress before any new Federal corporation may be established, and additional capital can be advanced to an existing corporation only by appropriation.

Enactment of this law was attributable in considerable measure to testimony before a Congressional committee by Jesse H. Jones, former head of the Reconstruction Finance Corporation, that the RFC had authority to lend, "any amount, for any length of time, at any rate of interest, to anybody."

JULES I. BOGEN.

PUBLIC HEALTH SERVICE, U.S. The United States Public Health Service, a unit of the Federal Security Agency, is the principal Federal agency devoted to protection of the nation's health. Its functions are: to extend and improve State and local health services through leadership, technical assistance, and the administration of financial aid; to protect the nation from the introduction of dangerous communicable diseases from abroad; to prevent the spread of communicable diseases from State to State; to seek the cause, prevention and cure for the diseases of mankind; to control the manufacture and sale of biologicals; to operate marine hospitals, and to disseminate public health information.

First established as the Marine Hospital Service in 1798 for "relief of sick and disabled seamen," the Service today provides medical care to all United States Merchant Seamen, Coast Guard, Public Health Service Commissioned Corps, field personnel and their families, as well as certain beneficiaries in other government agencies. In July, 1944, an Act reorganized the Service and codified all the existing health legislation and titles of authority into one basic law.

Groups serving as advisory boards to the Public Health Service are the National Advisory Health Council and the National Advisory Cancer Council, specifically authorized by the public health law. These Councils consult with and make recom-

mendations to the Surgeon General in matters concerning grants-in-aid, grants for general research, health activities, and functions of the Service. Other advisory boards are the Sanitation Advisory Board, Advisory Committee to the Division of Nurse Education, Board for the Control of Biological Products, Advisory Council on Nervous and Mental Diseases, Mental Hospital Survey Committee, Committee of Consultants in Dermatology, Committee on Post-War Training of Public Health Personnel, and the United States Public Health Service Advisory Committee on Public Education for the Prevention of Venereal Disease.

Appropriations for the fiscal year ended June 30, 1945, totaled \$129,007,715. On June 30, 1945, there were 635 regular corps members, 2501 members of the reserve corps on active duty, and approximately 13,375 civil service employees.

The Service is administered through 4 bureaus: the Office of the Surgeon General, National Institute of Health, Bureau of Medical Services, and the Bureau of State Services. Eleven District Offices carry on the field activities under the direction of a commissioned medical officer. Eight of these Offices are in continental United States, one each in Alaska, Hawaii and Puerto Rico.

Office of the Surgeon General. The Surgeon General, Dr. Thomas Parran, maintains general supervision over all the operations of the Service. Five divisions operating within his Office are: Commissioned Officers, Dental, Sanitary Engineering, Nurse Education, and Public Health Methods.

The Division of Commissioned Officers is responsible for recruitment, appointment, promotion, transfer, training, retirement, and all related work concerning commissioned personnel and interns. On June 21, the President declared the commissioned corps of the Service a military service and a branch of the land and naval forces of the United States for the duration of the emergency.

The Dental Division has general professional supervision over all dental activities of the Public Health Service and over all dental officers assigned to duty with other governmental agencies.

Sanitary Engineering continued the enforcement of regulations providing for the safety of water, milk and food, and general sanitary facilities of common carriers engaged in interstate traffic. It has given special attention to the supervision of health and sanitation services in war and industrial areas, assigning professional and technical personnel to State health departments. All vessel sanitation activities are under the supervision of this Engineering Division. Comprehensive milk sanitation surveys were conducted in 42 communities in cooperation with State authorities.

Nurse Education achieved its wartime goal of assuring "a supply of nurses for the armed forces, governmental and civilian hospitals, health agencies, and war industries" through the United States Cadet Nurse Corps. On July 1 the Corps completed its second successful recruitment campaign for which the goal was 60,000 new student nurses. Actual enrollments totaled 61,471. From the inception of the Corps in July, 1943, to June, 1945, some 16,000 Corps members were graduated. The added strength of nursing personnel is revealed by a comparison of 1942 enrollments in schools of nursing, 91,457, with the 126,576 enrollment in 1945. In accordance with the recommendations of the President and Congress, October 15 was set as the final date for new admissions. Total Corps strength on that day was 117,000. Under Public Law 74, provisions were made that these Cadet Nurses would be carried through to graduation.

Public Health Methods evaluates national health problems, develops methods to meet them, and disseminates health information to professional groups and the public.

The Division compiles and analyzes data on the nature and amount of sickness and death, and on the facilities and professional personnel available to meet health needs. It conducts statistical studies in the field of health economics, including methods for training personnel. During the year many special studies and research projects were carried on. These included studies of hospital insurance plans, and a survey of medical facilities and services for children. The hospital insurance study appraised the advantages and limitations of many such plans in the United States and ascertained the role they may play in bringing adequate health service to the entire nation. In the survey of medical facilities and services for children, the Service and the Children's Bureau of the Department of Labor cooperated with the American Academy of Pediatrics in a nation-wide study to determine the public health and medical needs of children. In cooperation with the National Foundation for Infantile Paralysis, a study is being made to provide quantitative means for measuring muscle strength in order to evaluate various methods of therapy. The Division also cooperated with the War Service and Postwar Planning Committee of the American Dental Association in the analysis of a questionnaire directed to all dentists serving the armed forces in an attempt to determine the future plans of Army and Navy dental officers. Significant numbers expressed the intention of moving to States where the ratio of dentists to population is already favorable. A definite trend away from rural areas was revealed. The Division publishes *Public Health Reports*, a weekly journal of scientific research. This includes current statistics on the incidence and geographic distribution of disease in the United States and throughout the world. The Division carried on intensive programs in health education. Educators were trained and assistance of an educational nature was given to States that requested such help. Information on Negro health work was continued through lectures, sermons, motion pictures, exhibits, clinics, and other health demonstrations.

National Institute of Health. The National Institute of Health is the research bureau of the Service, operated through 8 units: the National Cancer Institute, the Division of Infectious Diseases, of Physiology, the Biologics Control, Chemistry, Industrial Hygiene, Pathology, and Zoology Laboratories.

The National Cancer Institute conducted clinical and laboratory investigations in cancer. Grants-in-aid totaling \$140,043.44 for 19 research projects were approved in 1945. Since 1938, cancer has ranked next to heart disease as the chief cause of death in the nation.

Among the outstanding contributions of the Division of Infectious Diseases was the development and production of a typhus vaccine so safe and effective that there were no deaths from epidemic typhus among U. S. military personnel despite exposure in North Africa, the Middle East and Italy. The Division also produced an improved, safe, yellow fever vaccine for the armed forces. The Rocky Mountain Laboratory at Hamilton, Montana, continued the preparation of these vaccines as well as that for Rocky Mountain Spotted Fever. The Division also conducted studies on tsutsugamushi disease (scrub typhus), mumps, tularemia, rheumatic fever, tuberculosis, diarrhea, dysentery, food poisoning, and malaria.

The Division of Physiology concentrated on: development and use of new drugs to combat fatigue, control of dental caries and related oral diseases, physiology of the aging process, and physiology and biochemistry of faulty or inadequate nutrition.

The Biologics Control Laboratory continued testing the sterility, toxicity and potency of biologics—a function delegated to the Service by acts of Congress. To insure the quality of products, 53 domestic and 3 foreign laboratories were inspected.

The Chemistry Laboratory studied the carbohydrates to determine their structure, synthesis, and physiological action. The laboratory also cooperated in studies of pharmaceuticals for the treatment of malaria, filariasis, schistosomiasis, and other tropical diseases, and investigated biologics for certification.

To safeguard workers, the Industrial Hygiene Laboratory carried out studies of the hazards of the chemical components and end products of industrial processes to determine the engineering and medical control procedures. As a result of DDT studies for toxicity and potential dangers to human beings and warm blooded animals, directives were defined for the protection of persons engaged in its manufacture as well as for its utiliziers. There were only 22 deaths during the entire war period among the thousands of workers handling TNT in ammunition plants. This record, a direct result of a comprehensive program, is in contrast to that of the first World War when TNT poisonings caused 475 deaths in a period of about 8 months. In aviation medicine, the protection of pilots who must maintain efficiency under varied and exacting flying conditions required research into clothing, safety devices, and breathing equipment.

The Pathology Laboratory conducts investigations in the various fields of clinical and laboratory pathology and also the greater part of the pathological examinations for other laboratories of the National Institute. The Laboratory concentrated its work in three major research areas: dietary deficiency and toxicology, pathology of infectious diseases, and improvement of laboratory techniques.

The Zoology Laboratory is concerned with diseases caused by protozoan and worm parasites. Studies included research on carriers of the parasites (insects, water, snails) and methods of controlling such carriers. Tests for speedy diagnosis of rare diseases are completed within 24 hours and results wired back to the source so that patients may be treated correctly and promptly, confusion with more common diseases avoided, and the spread of the disease prevented. Specimens come to the National Institute at Bethesda, Maryland, from all over the world, for tests which give early and accurate diagnosis. This National Institute of Health is the only laboratory in the world offering such complete testing service.

Bureau of Medical Services. The Bureau of Medical Services is responsible for: all foreign and insular quarantine activities; medical inspection of aliens; medical services rendered to beneficiaries of the Service; administrative supervision of officers assigned to certain governmental agencies and of medical care services conducted with other governmental agencies. These responsibilities are discharged by the Hospital, Mental Hygiene, and Foreign Quarantine Divisions, Office of Nursing, and Medical Care in Other Agencies.

The Hospital Division administers 26 Marine hospitals, the National Leprosarium, the Sheepshead Bay Hospital for trainees of the Maritime Service, health and medical activities for the Coast

Guard, and the supervision of Freedman's Hospital for Negroes in the District of Columbia. The largest volume of medical relief in its history was furnished during 1945, with a total number of inpatients of 98,300, 81 percent more than in 1939. Applying for treatment in the out-patient department were 329,000, 70 percent more than in 1939 and 22 percent more than in 1944.

The Mental Hygiene Division, in order to determine the mental health needs of the States, continued its work of surveying public mental health hospitals. Seventy-one institutions in 20 States were studied in 1945. The Hospital in Fort Worth, Texas, operated by the Mental Hygiene Division, established a notable record. In the treatment of 2,559 psychotic patients from the military forces, approximately 80 percent of the patients were released as cured in six months, although many of these were sent back to their home communities with the recommendation that psychiatric supervision and counsel be continued.

The Foreign Quarantine Division administers the quarantine laws of the United States to prevent the introduction of quarantinable diseases—anthrax, cholera, leprosy, plague, psittacosis, smallpox, typhus, yellow fever,—from foreign ports into the United States and its insular possessions. The Division also provides medical consultation to the immigration service at home and abroad. Quarantine activities of the past year show the following percentage increases over the previous year: inspection of planes arriving, 77 percent more; vessels inspected, 39 percent; vessels fumigated, 25 percent; examination of passengers from planes, 83 percent; vessels, 77 percent; and crews from vessels, 32 percent. Quarantine regulations were changed so that ships fulfilling all quarantine requirements of the Hawaiian Islands group or the Puerto Rican group are no longer required to stop for a second quarantine examination at a continental United States port.

Medical Care in Other Agencies broadened and accelerated its work through cooperation with other agencies, official and voluntary health groups, and social welfare agencies and educational organizations.

Bureau of State Services: This Bureau brings together in one organization all those programs administered by the Public Health Service with the State and Territorial Health Departments. It includes the States Relations Division, Office of Public Health Nursing, Venereal Disease, Industrial Hygiene and Tuberculosis Control Divisions.

The States Relations Division assists State and local health departments in such major areas as the prevention of the spread of communicable diseases, dental health, plague control, malaria control, and drainage. A major responsibility is the administration of grants-in-aid to States. Allotments and payments increased from \$8,000,000, first authorized in 1936, to \$21,765,800 in 1945. The latter sum was divided—\$10,913,490 for general health, \$9,482,196 for venereal disease control, and \$1,370,114 for tuberculosis control. A wartime activity which still continues is the Emergency Health and Sanitation program. \$37,039,062 was appropriated directly to the Public Health Service for the administration of interstate quarantine, prevention of epidemics, and industrial hygiene activities as well as the assignment each year of between 300 and 400 professional personnel to State health departments.

Plague control was administered by the Plague Suppressive Measures Unit of the Division. This unit assisted States and municipalities in planning

and carrying out programs for rodent control.

Malaria control was handled by the Office of Malaria Control in War Areas. Beginning in July, the activities of this Office were expanded to include typhus, dengue, and pest control. In 13 Southern States the Public Health Service supplied men and equipment for the spraying with DDT of 300,000 houses located in malarious areas. Another disease and pest control program of the Office was *Aedes aegypti* control, instituted as a precaution against the reestablishment of dengue or yellow fever in this country.

The Hospital Facilities Section assists and cooperates with States, territories, communities, public and private institutions, organizations and Federal agencies in the development of adequate and improved physicians' facilities, standards, programs and operational details of hospitals, health centers, clinics and related activities.

The Tuberculosis Control Division was established on July 1, 1944, to assist State Health Departments in improving tuberculosis control methods. Assistance is given by financial grants-in-aid, by loan of technical and professional personnel, and by demonstration of techniques and methods. Objectives are: (1) case-finding; (2) expansion of sanatorium facilities, hospitals and clinics; (3) vocational rehabilitation; (4) adequate financial assistance to dependents of the tuberculous breadwinner. State Health Departments received from the Division \$5,200,000 in federal funds for improved tuberculosis control; and the services of 67 medical officers, 27 public health nurses, 4 sanitarians, and 16 reporting methods analysts. In addition, consultants were available in the fields of social service, vocational rehabilitation, vital statistics, sanatorium planning, health education, X-ray techniques and special research. Twenty-one photofluorographic X-ray units, utilizing miniature roll film, traveled through 30 States, demonstrating and assisting in tuberculosis case-finding. Case-finding programs demonstrate that 11 persons in every 1,000 apparently healthy adults have X-ray evidence of reinfection tuberculosis. About one-fourth of those found infected required immediate medical supervision.

The Venereal Disease Division investigates the cause, treatment and prevention of such diseases so as to cooperate with State departments of health for prevention and control within the States; and to prevent the spread in interstate traffic. Four important developments were: recognition that intensive treatment should be made an integral part of the long range control program; methods whereby treatment of gonorrhea with penicillin combined with the use of other drugs can be completed in a few days, intensive community-wide programs of public education, mass diagnosis, and treatment conducted in three large cities; the consideration of local, national and international control by the National Conference on Postwar Venereal Disease Control. Admissions to 2,500 clinics treating venereal disease totaled 278,369 cases of syphilis, a decrease of 22 percent over 1944, and 200,176 cases of gonorrhea, a 36 per cent increase. Rapid treatment centers admitted 61,898 cases of syphilis and 67,326 cases of gonorrhea. Fifty-four of these centers were operated by the Public Health Service and State health departments for the intensive treatment of syphilis. Gradually the Rapid Treatment Centers are being taken over by the States and cities. They have reduced the average stay of patients from 24 days to about 11 for syphilis, and from 18 to 3 days for gonorrhea, and are now treating approximately 180,000 patients a year.

Public Health Nursing has general supervision over all nursing operations of the Bureau of State Services. The Chief of the Office acts as adviser to other Divisions and to district offices. On June 30, 478 nurses and nurses' assistants were employed by the Bureau Divisions, 7 in the central office and 471 in the field services.

Industrial Hygiene continued its program for the protection and improvement of the health of industrial workers. Between 400 and 500 million working days were lost as a result of all types of disability. Industrial health problems have increased in complexity because of the many changes in the labor force, in materials and methods of production, and in working, home, and community conditions. The Division provides consultative service to State and local industrial hygiene organizations. All industrial areas were visited and services were concentrated in highly industrialized States like New York, Massachusetts, Illinois, Michigan, and Ohio. By June there were 49 active official industrial hygiene units of State and local governments located in 39 States. Approximately 375 professional and clerical personnel were engaged in industrial hygiene work in these units. In addition, there were on loan to the States from the United States Public Health Service 57 physicians, engineers, chemists, and nurses.

THOMAS PARRAN.

PUBLIC ROADS ADMINISTRATION (PRA). An agency of the U.S. Government under the jurisdiction of the Federal Works Agency. It normally administers Federal-aid funds and emergency appropriations for road construction, cooperating with State highway departments. It cooperates with the Department of Agriculture on forest roads and supervises the construction of national park roads.

With the beginning of war, approval of new projects was limited to those of direct importance to the war effort. Available Federal-aid funds and \$150,000,000 authorized under the Defense Highway Act of 1941, supplemented on July 2, 1942, by \$110,000,000, and on Apr. 4, 1944, by an additional \$30,000,000 were used to build access roads to Army and Navy training and concentration areas, war industries, and sources of raw materials. The Federal-Aid Highway Act of December 20, 1944, authorized the use of \$500,000,000 for needed highway improvements and to provide employment during the first 3 postwar years. A National Interstate Highway System to connect metropolitan areas and industrial centers and to serve the national defense was designated. Other plans included the development of secondary road systems in the various states and the modernization of various sections of the Federal-Aid system.

The organization is cooperating with the countries of Central America in closing gaps in the Inter-American Highway between the southern border of Mexico and the Panama Canal.

Commissioner in 1945: Thomas H. MacDonald. See BRIDGES; ROADS.

PUBLIC WORKS ADMINISTRATION (PWA). A government agency under the jurisdiction of the Federal Works Agency, now liquidated. The last appropriation was made in 1938. (See YEAR BOOK for 1940.)

PUERTO RICO. A West Indian island, forming a Territory of the United States; acquired from Spain through the Treaty of Paris, 1898. The adjacent islands of Vieques, Mona, and Culebra are included in its jurisdiction. The area of Puerto Rico is approximately 3,435 square miles.

Government. Under the Organic Act that was passed by the U.S. Congress in 1917 and later amended, Puerto Rico has the status of an organized territory of the United States. Its citizens are U.S. citizens. The executive power of the Territorial Government is vested in a Governor (Rexford C. Tugwell) who is appointed for an indefinite term by the President of the United States, subject to confirmation by the U.S. Senate. The legislative power is vested in a Legislature of two houses which is elected by popular vote for a 4 year term. In addition, there is a Resident Commissioner (Jesus T. Pinero) to the United States who is elected by the popular vote for a four-year term.

Events, 1945. The future political status of Puerto Rico has been the subject of discussion throughout the year by the Puerto Rican Legislature, the U.S. Congress, and President Truman. Early in March a majority of the Puerto Rican Legislature cabled to Senator Tydings an endorsement of his bill for Puerto Rican independence. Senate Bill no. 1002 provides for a referendum being held on the island so that the populace will have an opportunity to express their choice on: (a) Independence with economic amendments as suggested by a Legislative Commission (b) Statehood and (c) Dominion Status. President Truman has also proposed "that an early opportunity be given to Puerto Ricans to reinforce their local government and to settle by free choice their future relationship with the United States."

During 1944 there were 719,759 registered voters in Puerto Rico and 591,978 votes cast. The Popular Democratic Party, which won 17 out of 19 seats in the Senate and 37 out of 39 seats in the House of Representatives, received 383,280 votes, while the Union Republican Party received 101,779 votes and only one seat in the Senate and House. The Socialist Party received 68,107 votes and one seat in the Senate and the Liberal Party received 38,630 votes and one seat in the House. As a prelude to independence, Dr. Rafael Soltero Peralta, Chairman of the Puerto Rico Pro-Independence Congress, asked for a seat for Puerto Rico at the United Nations Security Conference held in San Francisco.

The Puerto Rican Land Authority has been authorized by the Puerto Rican Legislature to purchase or take an option on the land holdings of any corporation owning more than 500 acres. A working fund of \$21,000,000 has been appropriated by the Legislature for this purpose. An option to purchase the land holdings of Russell and Company has been taken and the Legislature's application for an extension of its option on the lands of the Fajardo Sugar Company was approved by stockholders of the company. The legality of these land acquisitions and the 500-acre limitation on land holdings is still being contested by various corporations on the island.

Population. As of July 1, 1944, it was estimated at 2,037,255 as compared with 1,869,255 in 1940. During the 1940 census, dwellers in places of 2,500 or more numbered 566,357 and the rural population 1,302,898. The territory had 544.2 inhabitants to the square mile—an exceptional density for an area dependent mainly on agriculture. Chief cities: San Juan (capital) 169,247 inhabitants, Ponce 65,182, Mayaguez 50,376. Seventy-six percent of the people are native-born whites and the remaining 24 percent are for the most part Negroes and Mulattoes. During 1943 there were 77,304 births and 29,019 deaths.

Education. Out of more than 700,000 children of school age, only 302,806 were enrolled in the pub-

lic schools during the fiscal year 1943. Of the total enrollment, 155,899 were in rural zone schools and 146,907 in urban zone schools. There were 7,088 field personnel and teaching positions in the Puerto Rican School System. The University of Puerto Rico located at Rio Piedras, ten miles from San Juan, had 6,060 students in 1943-44.

The Economy. The island is predominantly agricultural, with about 825,000 acres under cultivation out of a total area of some 2,000,000 acres. The two leading export products are sugar and tobacco followed by fruits and coffee. Lack of shipping space has curtailed exports of fruits and coffee. Shipments of domestic and foreign merchandise from the United States to Puerto Rico in 1943 and 1944 amounted to approximately \$87,000,000 and \$119,000,000 while shipments from Puerto Rico to the United States amounted to \$99,000,000 and \$123,000,000, respectively.

Sugar shipments from Puerto Rico accounted for \$45,000,000 and \$53,000,000 while rum shipments accounted for \$24,000,000 in both years, and tobacco, \$12,000,000. In 1943-1944 there were 723,611 short tons of sugar produced, 15,000 short tons of tobacco and 11,000 short tons of coffee.

Needlework is the largest industry of the island not associated with agriculture and during 1943-44 exports totaled approximately \$14,500,000.

CHARLES F. REID.

PUERTO RICO RECONSTRUCTION ADMINISTRATION (PRRA). A division of the U.S. Department of the Interior, established in 1935. With funds aggregating approximately \$70,000,000 it has conducted a broad program of work relief projects to increase employment in Puerto Rico, with emphasis on rural rehabilitation of needy persons. No further appropriations were made by the Seventy-eighth Congress and during the fiscal year 1945 only limited projects were under way. Administrator: Benjamin W. Thoron.

PULITZER PRIZES. A series of annual awards established in 1915 by the will of Joseph Pulitzer, publisher of the New York World. On May 7, 1945, the following awards were made by the Trustees of Columbia University on the recommendation of the Advisory Board of the Graduate School of Journalism:

Prizes in Journalism: (1) For the most disinterested and meritorious public service rendered by an American newspaper, a gold medal costing \$500: *The Detroit Free Press* for its investigation of legislative graft and corruption at Lansing, Mich. (2) For distinguished correspondence, \$500: Harold V. Boyle of the Associated Press for his chronicling of the human side of the war. (3) For telegraph reporting on international affairs, \$500: Mark S. Watson of *The Baltimore Sun* for distinguished reporting in 1944 from Washington, London, and the European war fronts. (4) For telegraph reporting on national affairs, \$500: James B. Reston of *The New York Times* for his news dispatches and interpretative articles on the Dumbarton Oaks Security Conference. (5) For local reporting, \$500: Jack S. McDowell of the *San Francisco Call Bulletin* for his articles on blood donation. (6) For news photography, \$500: Joe Rosenthal of the Associated Press for his photograph of marines raising the United States flag on Mt. Suribachi, Iwo Jima. (7) For distinguished editorial writing, \$500: George W. Potter of *The Providence Journal-Bulletin* for various editorials, especially those on the freedom of the press. (8) For distinguished service as a cartoonist, \$500:

Sgt. Bill Mauldin of United Features Syndicate, Inc. for his bitter cartoon of an American soldier escorting German prisoners. (9) A special journalism citation commending the "cartographers of the American press, whose maps of the war fronts have helped notably to clarify and increase public information on the progress of armies and navies engaged."

Prizes in Letters: (1) For a distinguished novel published during the year by an American author, preferably dealing with American life, \$500: *A Bell for Adano* by John R. Hersey (Alfred A. Knopf, Inc.). (2) For an original American play, performed in New York, preferably dealing with American life, \$500: *Harvey* by Mary Chase, produced by Brock Pemberton. (3) For a distinguished book of the year upon the history of the United States, \$500: *Unfinished Business* by Stephen Bonsal (Doubleday, Doran & Co., Inc.). (4) For a distinguished American biography, \$500: *George Bancroft: Brahmin Rebel* by Russel Blaine Nye (Alfred A. Knopf, Inc.). (5) For a distinguished volume of verse, \$500: *V-Letter and Other Poems* by Karl Shapiro (Reynal and Hitchcock, Inc.).

Prize in Music: For distinguished musical composition, \$500: *Appalachian Spring* by Aaron Copland, a ballet written for and presented by Martha Graham and her company at the Library of Congress in Washington in October.

Annual Scholarship: To an art student in America certified by the National Academy of Design, \$1,500: Vincent de Gregorio, New York City.

RACING. The year 1945 started off in a complete blackout for racing. From Jan. 2 until May 12 every track in the country remained closed at the request of James F. Byrnes, then Director of War Mobilization and Reconversion. But as the year ran its course, the sport of kings rose from this Stygian darkness to the brightest heights in turf history. Although no Man O'Wars were uncovered to dazzle the imaginations of turf followers, attendance and betting figures soared to astronomical figures.

Money flew thick and fast as racing, greatest beneficiary of inflated earnings, mushroomed into America's most lucrative sport. The racers came out of hiding with V-E Day and tracks reopened in Illinois and Rhode Island on May 12. From then on, lost time was made up and midway through the summer it became apparent that racing was speeding to its most successful campaign.

On Memorial Day ten tracks played to 333,195 customers, who poured the staggering sum of \$13,476,021 into the mutuel machines. Million-dollar betting days once were only dreams, but in New York \$3,000,000 afternoons became almost routine and \$4,000,000 days were frequent. Then on Sept. 22, at Belmont Park, spectators bombarded the machines with a total of \$5,016,745, the highest in history.

Although the number of racing days was reduced 25 percent by the blackout early in the year, attendance neared 25,000,000 and wagering came close to a billion and one-half dollars as compared to 18,000,000 and \$1,126,308,645 in 1944. In New York alone, the total bet was \$450,663,190, with a return to the State treasury of \$30,333,299. These record figures were returned in spite of the fact that there were only 154 days of racing in the Empire State as compared to 189 the year before, when a total of \$410,230,402 was wagered.

Louis B. Mayer's Busher, a 3-year-old filly, was the horse of the year. The daughter of War Ad-

miral won 10 of 13 starts before being temporarily retired with an injury and she amassed \$273,735 in prizes, bringing her to seventh place among the all-time money winners with a grand total of \$334,035.

The Kentucky Derby, classic that survived the war years without interruption, proved a runaway for F. W. Hooper's Hoop Jr., who also finished second in the Preakness and won one-half of the rich Wood Memorial before an injury caused retirement. P. A. B. Widener's Polynesian annexed the Preakness and the Withers, but proved spotty thereafter. C. V. Whitney's Jeep was a victor with Hoop Jr. in the Wood, which was run in two sections.

Best 2-year-old filly was Beaugay, with Star Pilot the cream of the young colts. Fighting Step was a consistent winner among the 3-year-old colts and Styxie proved leader of the handicap horses.

The year saw a new stable gain prominence, the Main Chance Farm of Mrs. Elizabeth N. Graham of New York being the big winner. With the veteran Tom Smith as her trainer, Mrs. Graham invested \$299,700 in thoroughbred stock the previous year and the close of 1945 found her the leading money-winning owner with \$503,985, a sum that made Smith the top man among trainers. J. Dean Jessop, 19-year-old Utah youth, was the champion of jockeys, his total winning mounts nearing the coveted "300" mark as 1945 ended.

The usual number of doping cases were revealed, and turf fans were shocked late in the year when it was announced that the popular Tom Smith had been barred from racing for a year for an alleged stimulation of a horse named Magnific Duel. Smith denied all charges and filed an appeal, while his case became a cause célèbre to those who have followed his colorful career.

Racing took a decided step forward late in December when the Thoroughbred Racing Association announced the formation of a private protective agency. Spencer Drayton, fourteen years a member of the F.B.I., was named administrative organizer of the group, which is to have a free hand to deal with any practices that might prove harmful to the sport.

Harness-racing followed the pattern set by the turf and a record \$40,000,000 was wagered on the sulky drivers, \$28,000,000 being bet at the Roosevelt track in Westbury, L.I. The blue ribbon event of the harness world, the Hambletonian, returned to its original setting at Goshen, N.Y. Titan Hanover, 3-year-old bay trotting colt owned by E. Roland Harriman and Maj. Elbridge T. Gerry, who went on to become the trotter of the year, captured the Goshen classic in straight heats. In fact, Titan Hanover was such a standout that the public was not permitted to bet on him in the Hambletonian.

THOMAS V. HANEY.

RAILROAD RETIREMENT BOARD. An independent executive agency of the U.S. Government which administers a retirement system and an employment service system for railroad employees. For 1945 activities, see RAILWAYS. Chairman: Murray W. Latimer.

RAILWAYS. After the German surrender but before Japan had been beaten the New York Times said editorially:

"Passenger traffic this year is expected to reach the record total of approximately 105 billion passenger miles, five times the traffic of 1939 and two and a half more than the big year of 1918. This record is being made with 30 per cent less equipment than the railroads had in 1918

... Now, in spite of automobiles, trucks and airplanes, the railroads are hauling many more passengers with almost a third less equipment.

"The amount of freight is so stupendous that the average person cannot understand the railroading problems involved."

"In the face of man power shortage and shortage of equipment the railroads have done a prodigious job in the nation's greatest emergency."

While this was intended to sum up the entire war record of the railways it is an understatement of railway operation in 1945. By that year both the difficulties to be overcome and the work to be performed had accumulated in geometrical ratio. The mere number of persons employed and the number of units of equipment in service is not a full measure. Many of the persons were inexperienced and the equipment was in a condition that required more repairs than would have ordinarily been necessary.

Detailed figures are given below but general conditions are needed as a background.

Much of the financing of railways has been done when money cost from four to five per cent. During 1945 money cost about half that. Therefore much railway refinancing was done especially by companies having established earning power. What was done by the Chicago, Burlington & Quincy is the best example.

The Burlington received permission from the Interstate Commerce Commission to sell at 100 0399 an issue of \$65,000,000 first and refunding 3½% bonds due 1985. With the proceeds from this sale the Burlington paid off \$39,493,000 first and refunding 3½% bonds that would have become due in 1974 and also paid off a total of \$30,000,000 collateral trust bonds carrying 3½ per cent interest. The bonds were sold to a group of bankers headed by Morgan, Stanley & Co.

The saving in yearly interest was \$497,737.50. The premium received by the railway company was \$25,935. The bankers make their profit from the difference in price between what they paid, namely 100.0399, and the price they can get for a 3½ per cent railway bond.

This should be contrasted with Pennsylvania Railroad stock paying \$2.50 a share and selling on the New York Stock Exchange for \$45. Refinancing bonds with stock issues was quite out of the question for railways in 1945 although it was done to some extent by the Industrials.

Reorganizations. Nothing could have been more helpful than the low price of money in the reorganization of railways that were in, or on the verge of, bankruptcy. The Erie Railroad, which ever since Jay Gould's time has had a minus credit, on April 17, 1945, sold \$79,400,000 bonds with various due dates. The bonds carried a 3½% interest coupon. The cost of the money to the railway company varied according to due date from 3.15% to 2.09%. Proceeds received from the sale of the bonds are being used to redeem \$5,500,000 short term notes and the entire issue \$87,185,500 first consolidated 4% bonds due 1995 but callable at 105.

The Wabash Railroad, another railway with heretofore poor credit, sold in February \$47,000,000 first mortgage 3½% bonds due Feb. 1, 1971, at 98.38, a cost to the railway of 3.3436.

In the reorganization, total debt was cut down from \$152,658,769, the total in 1941, to a total of \$78,690 in 1945.

On February 19, 1945, the Pere Marquette Railway sold \$50,000,000 first mortgage 3½% bonds due 1980 at 99.71, a cost for money to the railway company of 3.383 per cent.

The Pere Marquette is the case of a railway subject to the minimum of competition from trucks and airplanes. It operates 1,949 miles, serving the state of Michigan, and connects Detroit with Chicago (in part over trackage rights) and Detroit with Buffalo (in considerable part over trackage rights). Thus its principal business is that of carrier for heavy industry. During the years 1942-44 there were 203 new industries established near the lines of the Pere Marquette.

Early in the year the Interstate Commerce Commission approved a reorganization plan for the Florida East Coast Railway. The total capitalization of the new company is to be \$41,166,000 of which only \$666,000 is to bear fixed interest charges and even this is equipment trust certificate debt.

While the financing done by the Virginian in April, 1945, was not a reorganization in the sense that it was revolutionary it was the culmination of an evolution that is significant as showing what was possible for a prosperous railway in that year. The railway company sold \$60,000,000 new first lien and refunding 3 percent bonds due in 1995 at 105.669. That was a cost of money to the railway of only 2.79 percent. It left the Virginian with a total funded debt of \$60,000,000 and \$27,955,000 cumulative 6 percent stock and \$31,271,500 common stock as capitalization for a company operating 657 miles of absolutely first class railway, of which 30 miles is double tracked; of the total operated, 138 miles is electrified. About 90% of the total freight carried is coal, something that neither truck nor airplane is likely to take away. That such a railway can get its money about as cheaply as one of the States could in 1945 is suggestive.

On March 1 the final decree in the reorganization of the Chicago & North Western Railway was signed. Ten years had been spent in putting through a satisfactory reorganization.

The Interstate Commerce Commission approved a second plan for the readjustment of the debt of the Baltimore & Ohio Railroad, the first plan approved by the I.C.C. having failed.

The fixed charges upon the termination of the new plan will be \$17,567,299 as compared with \$25,265,049 under the previous plan. The new plan has 20 years of "breathing spell" before the full fixed charges must be paid; the first plan had a maximum "breathing spell" of 8 years.

The developments of the year pretty well cleared up the most pressing financial problems of the major railways. The Seaboard Air Line was sold to a reorganization committee on May 31 and the Chicago, Milwaukee, St. Paul & Pacific was turned over to five trustees on Nov. 26.

So much stress has been laid on the financial condition of the railways because it is the judgment of railway officers that railways can hold their own against bus, truck and airplane competition if the only consideration be service rendered; but that the crucial questions are going to depend on the railways being able to get sufficient business of the kind they are especially fitted to handle to cover the cost of their necessarily heavy capital outlay.

The difference between future earning power of the Virginian, hauling three thousand-ton train loads of coal, and the earning power of the Seaboard Air Line, hauling perishable and commodity freight and doing a large, high class passenger business, was reflected in the railway financing of 1945.

Consolidations. It seemed almost as if the spot

light were thrown on the utter failure of all theoretical plans to consolidate railways when the Baltimore & Ohio announced late in May the withdrawal of claims against the Chicago & Alton. This permitted the consolidation of the C. & A. with the Gulf, Mobile & Ohio. The new railway system set up by this consolidation will give a 3,000 mile line connecting Chicago with the Gulf of Mexico and will bring competition into a territory heretofore served exclusively by the Illinois Central. The theoretical plans for consolidation were designed to promote cooperation. This actual consolidation creates cutthroat competition.

Details of Accomplishments. The ton mileage carried by the Class I railways of the United States in 1945 was 680,000,000,000. This is the equivalent of carrying 680 million tons from New York to Chicago. The passenger mileage was 91,000,000,000. This is the equivalent of carrying 91 million passengers from New York to Chicago.

This work was done despite a pernicious manpower shortage. On March 31 the United States Railroad Retirement Board said that it had unfilled orders for 94,738 railway employees which included 4,740 trainman, 156 enginemen and motormen, 1,379 firemen, 3,163 clerks, 8,011 freight and express handlers, 32,057 trackmen, 1,726 signal men, 482 linemen, 1,465 telegraphers, and 22 train dispatchers. It was estimated that on Feb. 15 out of a total of 1,400,000 employees there were 700,000 who had had no railway experience prior to Pearl Harbor.

The Railroad Retirement Board has done invaluable service in procuring and placing railway labor. For instance during the 11 months ended March 31 the Railroad Retirement Board procured and placed 27,482 veterans of World War II in railway service.

The manpower shortage becomes more impressive as its implications are studied. Perfectly maintained track is basic to safe railway operation. The shortage of 32,057 trackmen seems trivial, but, allowing 4 man to a mile for track maintenance, it follows that thirty-two thousand miles of railway would be unsafe but for extraordinary effort on the part of railway officers.

There are no complete figures for the shortage of railway mechanics but the inspection of even a few railway shops indicated the shortage was serious.

As early as January, 1944, over 30 percent of the freight cars in service in the United States had been built more than 25 years. The economical life of a freight car is less than ten years. The reasons for conditions in 1944 are to be found in the starving of the railways during the depression. By 1945 many cars and locomotives barely staggered through the day's work. Cars and locomotives in that condition came in for repair by inexperienced mechanics. It was under these conditions that railway operating officers showed at their best. The average mileage per car per day in 1945 was 52.3.

Earnings. Large revenue and heavy expenses resulted from the extraordinary movement of traffic, with a fairly large net for railway security holders and considerable over time wage payments to railway employees, but nothing except additional work and responsibility for railway officers.

Table I gives a combined income account for Class I railways of the United States (All those earning more than a million dollars a year.)

Table II gives the break-up of revenues and

TABLE I

	1944	1945
	(millions)	
Operating Revenues	\$9,437	\$9,146
Operating Expenses	6,282	6,620
Taxes	1,846	1,377
Net Railway op income	1,106	983
Fixed Charges	439	404
Net for Stock	667	579

* Includes bond interest and rentals.

TABLE II

	1944	1945
	(millions)	
Freight Revenue	\$6,999	\$6,809
Passenger Revenue	1,790	1,696
Mail Revenue	130	132
Express Revenue	144	149
All Other Revenue	374	378
Total	9,437	9,164

TABLE III

	1944	1945
	(millions)	
Maintenance of Way, etc.	\$1,263	\$1,327
Maintenance of Equipment .. .	1,587	1,602
Traffic	137	143
Transportation	2,974	3,020
General and Other.	321	328
Total	6,282	6,620

Table III gives the break-up of expenses.

In regard to the heavy expenses for maintenance of both equipment and way it is important to remember that these large dollar outlays do not represent equally large effective repairs. Unskilled workmen were paid skilled workmen's wages.

Motive Power. The three types of locomotives that were being tested in 1945 were (1) the Diesel-Electric, (2) Steam Turbine and (3) the Gas Turbine.

The Chicago & Alton put three 4,000 hp Diesel-Electrics in passenger service between Chicago and St. Louis. They are said to be giving very satisfactory service where smoothness of operation, speed and reliability are important factors in the keen competition for high-grade passenger business.

The Baltimore & Ohio put, on the Baltimore to Washington, D. C. run, a 2,000 hp Diesel-Electric. It was the first road-type, through service Diesel built by the Baldwin Locomotive Works in collaboration with the Westinghouse Electric & Manufacturing Co. The locomotive has two 1,000 hp eight-cylinder Diesel engines. The underframe, trusses, and sides of the locomotive are welded together to form the equivalent of a single piece of steel, giving greater resistance to impact and a minimum of vibration.

A direct-drive Steam-Turbine is now in service on the main line of the Pennsylvania Railroad. Its outstanding advantages are that it gives 20 per cent more power from a boiler than would a steam locomotive without the turbine. It is for use in both passenger and freight service. The total engine weighs 580,000 lbs. The forward tractive force is 70,500 lbs., the reverse 65,000 lbs. The most successful steam-turbine in use heretofore is that on the London, Midland & Scottish. It was placed in the London—Glasgow service in 1933.

The third type of motive power has been designed by the Allis-Chalmers Manufacturing Co. but is not in service as yet. It is a road locomotive of 4,800 hp. The over-all length is 90 ft. and the

weight is 450,000 lbs. The advantage claimed for this type of locomotive is that no water is required in its operation. The elimination of stops for water and the elimination of the costs of water facilities would of course be a major economy.

Orders for New Equipment. The needs for additional cars and locomotives is reflected only roughly in the orders placed in 1945, because the man who decides on the size and character of the order is not the man either using or repairing equipment. The most that the officer "at the front" can do is to make recommendations. How closely these will be followed depends on the price at the moment of various types, the price of money and so on.

The total number of locomotives ordered in 1945 was 856, of which 702 were Diesel-Electric. This compares with a total ordered in the previous year of 757. In 1944 the total was divided, steam 74 Diesel 680.

The number of freight cars ordered in 1945 was 39,039. Of this total 16,106 were box cars, 6,075 were gondola and 1,240 were flat cars. The total ordered in 1944 was 44,825 which included 23,860 box cars; 7,224 were gondola and 550 were flat cars.

The total number of passenger cars ordered in 1945 was 2,998 comparing with 715 ordered in 1944.

About the only significance of the figures for new mileage built is that they show that even under war conditions there were some needs for transportation great enough to require the use of man power and materials. The new mileage built in 1945 was 65 comparing with 121 miles built in the previous year. In both cases the mileage is that of first track. In 1887, the year the Interstate Commerce Commission was created, the new mileage of railway built was 13,081.

Less Than Car Load Freight. One of the weakest factors in American railway practice has been the handling of less than carload freight. That is easily explained. Loading coal into open top, 70-ton capacity cars and hauling it in 60-car trains to tidewater, where the car is picked up bodily and its contents dumped into the hold of a vessel, appeals to the American imagination. Stowing packages in a box car does not. However this "chicken feed" business is expensive and is of personal importance to thousands of the public, whereas the handling of coal is of remote interest to all but a few.

The Pennsylvania Railroad installed 25 Buda "Chore Boy" gasoline engine-powered platform trucks of 1,000 lbs. capacity at its 11th Street freight station at Pittsburgh in April, 1945. The investment was \$17,000 and the estimated yearly saving is \$27,000.

This is by no means the first experiment with power trucking, but it is the first *comprehensive* experiment on such a large scale. This station is the road's principal L.C.L. terminal in the Pittsburgh district. It is completely modern in its layout. L.C.L. freight from thirty miles around is assembled and sent out from here. The east side of the station is an inbound freight house, 80 ft. wide and 800 ft. long. The west side is 30 ft. wide and 800 ft. long. A total of 186 cars can be spotted on the eight tracks comprising the station layout. A round trip from the north to the south end of the station is nearly half a mile. The "Chore Boys" are operated by the truckers themselves, who ride with the load instead of walking and pulling the load. On an average run of light, bulky freight, a "Chore Boy" handles as much freight per trip as a hand

truck, at a much higher speed. Besides the increased speed there is the decreased strain on the trucker. At present there are an average of 65 women employed daily as truckers. For the future it is of importance that lightweight men or youths can be employed in this class of work.

It is as hard to convince railway executives of the importance of improvement in the "details" of L.C.L. handling as it is to overestimate its far reaching effect in a time of life and death competition with trucks and airplanes.

It has always been possible for railway employees to share in railway profits provided they can save enough to invest in railway stocks. However they have almost never done so. Now the Central Railroad of New Jersey has proposed a plan, which has been submitted to railway labor union leaders, for profit sharing without a deduction from wages. Details of the plan have not been made public but that such a plan is being seriously discussed is worthy of note.

Radio Telephone in Railway Operation. The Chicago, Rock Island & Pacific has undertaken the installation of radio-telephone train communication on the 160 miles of double track between Chicago and Rock Island. The railway is to use the ultra-high frequency waves (2,660 megacycles) with Klystron tubes. This opens up for possible railway use, a portion of the radio spectrum in which there are an enormous number of unused channels. The feature that is peculiar to railways is an assembly of platters or discs mounted on a short hollow tube only a few inches high, this being important where the clearance on cars and locomotives is limited.

For a considerable part of 1945 this type of equipment has been in regular service on one through-freight train operating daily between Rock Island and Kansas City. The advantages are that the ultra-high frequency is not subject to fade-out or "blind spots" under any adverse conditions such as tunnels, gorges or steel bridges.

British Railways. All during the "blitz," the flying bombs and rockets, the railways of Great Britain were kept open and, after a fashion, in operation by the exercise of remarkable ingenuity. The total number of bomb incidents to railway property was 13,891.

The standard procedure for bomb hits on track was to shovel by hand into the crater the material that had been blown out, and fill up with carloads of cinders brought from both sides of the break. Bulldozers could seldom be used because there was more often than not bomb damage somewhere between the crater being filled and the place where the bulldozer was. There was also an acute shortage of timber. A large amount of reinforced concrete was used either as a complete tie or as an isolated block under each rail.

German Railways. Col. John W. Wheeler, XVI Corps of Engineers, 9th U.S. Army, writing in the *Railway Age* about German Railways at the end of the War, says:

"The ability of the German Railways to continue to operate under terrific air attack prolonged the war for many months. . . .

"Over long periods of time the Allied air forces reported destroying great numbers of locomotives, cars, bridges, yards and terminals, but to our surprise the enemy kept on rolling . . . to the astonishment of all, when the Ruhr industrial district was captured there was found there and in Westphalia, just south of the Ruhr, hundreds of locomotives in good condition and thousands of cars—box cars, flats, gondolas, new refrigerators, coaches, and sleeping cars. True, the enemy had robbed the railroads of France, Belgium, and Holland. Even so, his losses were terrific over a period of months, and he still had motive power and cars aplenty when the end

came. The railways were finally put out of business by Allied air forces who cut rail in enough places [see British railways above] to prevent repair. Thereby they penned up the equipment until ground forces could overrun it. . . .

"In the final days of the struggle . . . the enemy destroyed very nearly all of his railway bridges, and on the Rhine he accomplished total destruction. All bridges such as the one at Dusseldorf were destroyed beyond repair.

"We merely repaired the lines we needed for our supply, but the railway people cooperated heartily and seemed anxious to get their lines back in operation."

Bridge Over the Rhine. A piece of railway construction that will probably stand for some time as a record was done at Wesel during the last of March, 1945. The work consists of a 1,752-ft. single track bridge over the Rhine, a 463-ft. bridge over a nearby canal, two miles of connecting track, and yards at Wesel and Buderich.

Construction began at 6 P.M. March 29, and was ready for traffic 10 days, 4 hours 45 minutes later. The work was done by U.S. Army Engineers and the Transportation Corps' Second Military Railway Service. The bridge is a 23-span, semi-permanent structure using meter-beams (rolled I-beams 39.37 inches in depth) developed by the Germans and rolled by them at a plant at Luxembourg. The weight of the bridge is 2,140 tons. A total of 780 Navy lighterage pontoons, each weighing 24 tons, were used during construction. In driving piling, five pile drivers were used continuously. All the equipment used in building the bridge originated in the United States. The materials were those nearest to hand. The officers and men of the 1056th Engineer Group were under the command of Col. James B. Cress, former regional director of the Railroad Retirement Board for the San Francisco Region.

Military Railway Service. In June this service consisted of 74 units and had a personnel of 1,147 officers, 45 warrant officers, and 25,490 enlisted men. Of the 74 units, there were 24 Railway Operating Battalions.

Brig. Gen. Carl R. Gray, Jr. in his official report says:

"When the Military Railway Service was organized and planned for, it was anticipated that each Railway Operating Battalion would operate up to a maximum of 150 miles and run a maximum of 24 trains in each direction. For the 24 operating battalions we have, this would amount to a total of 1,152 trains over a 150-mile stretch . . . this would produce 8,600 miles. . . . Instead of that, we operated over 25,120 miles . . . and instead of the estimated maximum of 1,152 trains, we actually operated on this particular day (June 7) 1,219 trains over 25,120 miles of track."

This was not a maximum day—the maximum day was June 25, when that division handled 1,958 loads and 653 empties, the net tons being 26,796.

France. The 723rd Railway Operating Battalion was about as much occupied in alleviating the condition of the liberated French people as they were in operating the railways of that devastated country. Originally they had but sixty miles of double track, but by March there were 120 miles of line and two major terminals. They did all the essential work of moving supplies and in addition established such things as soup kitchens proving "God-sends" to those who had been deprived of their sole means of support by the Germans.

Swedish Railway Electrification. This year was the 30th anniversary of the completion of the first electrified steam railway in Sweden.

The Swedish State Railways operates 6,990 miles of the country's total of 10,200 miles of railway lines. It is estimated that electrification has saved during the war 7,000,000 metric tons of coal. The cost of the coal would have been

\$137,500,000, whereas the cost of the electrical energy was about \$22,500,000. The electrified lines also permit the operation of faster and heavier trains. This is an indication of the saving by electrification where conditions for the generation of electricity are as favorable as they are in Sweden.

Rates. An American railway executive when in a pessimistic mood will tell you that his frontiers most needing defense are on the outskirts of Washington, D. C.

The Interstate Commerce Commission ordered, in 1945, a general increase of 10 percent in class rates applicable to Official territory and a general decrease of 10 percent in class rates applicable within and between Southern, Western Trunk-line, and Southwestern territories on one hand and Official territory on the other, subject to prescribed distance rates as minimum.

That readjustment of rates may be in accord with abstract justice, but it upsets railway earnings at a time when earnings are most uncertain, owing to the change over from war to peace conditions.

The U.S. Department of Justice has brought suit against the railway rate associations as being violators of the Sherman Anti-Trust law. The associations had for years been approved by the Interstate Commerce Commission as being reasonable devices for the stabilization of rail-freight rates. Stabilization is in the interest of shippers as well as railways.

WILLIAM E. HOOPER.

RAPID TRANSIT. Local urban and suburban transportation in the United States appears to be in a transitional stage, with many changes pending, but checked by problems of finance and management. Some improvement projects include municipal ownership, but there is no decided trend in that direction, largely because of the possibilities of political influence. Total local transportation traffic of 1945 in the United States was estimated at slightly under 23-billion riders, as compared with 23,017,000,000 in 1944. These figures cover electric street railways, elevated and subway lines, inter-urban electric railways, and motor bus and trolley bus lines; they do not include taxicabs or suburban services of railroads.

Further decline in total traffic is considered inevitable in the early stages of the postwar period, as restrictions on automobiles are relaxed. Reduced mileage of street railways is also anticipated; it has declined already from 25,470 miles in 1935 to 16,860 in 1945. Elevated and subway lines increased from 1,230 to 1,252 miles, and bus lines have increased enormously. Electric railways total 9,412 miles of line (or route), with 18,112 miles of track. Of these, 382 route miles (with 1,252 of track) are subway and elevated lines. Trolley bus lines total 1,164 route miles; motor bus lines have 87,700 miles of round-trip routes. Of the passengers, 12,137,000,000 were on electric lines (including 2,621,000,000 on subway and elevated lines); 1,234,000,000 on trolley busses and 9,646,000,000 on motor busses.

Employees number 242,000, with a pay-roll of \$599,000,000. Total revenue reached the all-time record of \$1,362,000,000, an increase of 5.28 per cent over 1943; but operating expenses increased 8.48 per cent and took 74.29 per cent of the revenue. Equipment included 37,285 electric cars (10,105 on subway and elevated lines), 3,555 trolley busses and 48,400 motor busses. This equipment is inadequate for the traffic, and much of it is old, but it will take some time to acquire the needed new cars and busses.

Traffic congestion in busy streets and the desire to expedite the movement of street cars are main reasons for the increase in subways and the plans for further increase (as at Cleveland, Detroit, Washington, New York, Montreal and Toronto). While subways would expedite the travel of street cars they would not greatly reduce traffic congestion, and might result in reduced volume of traffic on the cars, owing to the longer distances between stops and the inconvenience of stairways. On the other hand, removal of tracks from the streets, as at Seattle and other cities, may expedite all traffic by giving a clear roadway. Busses also have the advantage of taking up passengers and setting them down at the curbs. Traffic congestion may often be relieved by regulation of movements and more strict control of street parking. Marked improvements expected in new cars and busses include capacity, comfort, convenience, heating, lighting, air conditioning, ventilation, and smooth or noiseless riding.

At Boston there is a project for taking over all local transport services (surface, elevated and subway) and all railway suburban services within a radius of 12 miles, and operating the whole system as a unit. The plan is somewhat similar to that of the London Passenger Transport Board (England), which has been in operation for some years. In New York, the Bureau of Transportation has a 6-year improvement project, including a Second Ave. subway to the Bronx and a 72d St. crosstown subway with tunnel under the East River. The bus terminal proposed by the New York Port Authority, adjacent to the Lincoln Tunnel entrance is reported approved by some 30 bus lines coming in from the west. It would be 200 x 800 ft. (40-41st Sts. and 8th and 9th Aves.), with a flat roof for helicopter planes. A downtown subway for street cars is proposed in Los Angeles.

A municipal ownership project at Cleveland, Ohio, includes a 15-mile east-west line and a 2-mile downtown subway; all street cars to be replaced by busses, with express service on some bus routes. An important step in solving the complicated situation at Chicago was the passage, by the State legislature (April 12), of the Metropolitan Transit Act. Under this Act Chicago adopted an ordinance giving an exclusive franchise to the Chicago Transit Authority (April 23). The ordinance was approved by referendum vote (June 11). The Chicago Transit Board of 7 men (four named by the Governor and 3 by the mayor) was appointed June 28 and accepted the franchise on July 10. It adopted the city plan to purchase the Chicago Rapid Transit Co. (elevated lines) for \$75,000,000, and the Chicago Surface Lines for \$12,162,000. Both concerns are in bankruptcy and under the jurisdiction of the Federal court. The Authority also plans to purchase the Chicago Motor Coach Co. The validity of the State Act has been endorsed, but there are financial and other difficulties still to be faced. Work on the city's Dearborn St. subway (80 per cent completed) is to be resumed in 1946.

Many of the bombed cities in Europe kept street-car and subway lines in operation to some extent. Toronto plans a shallow subway for street cars, and also a bus terminal. Glasgow, Scotland, has plans for a subway. In Berlin, several of the subway lines and stations (used as shelters and as military repair shops) have been restored to service. A 6-mile subway system at Kiev, Russia, is reported under construction, to connect the center of the city with three suburban areas. A subway at Johannesburg, South Africa, serves the

new railway station, which has its tracks 20 ft. below the street level and a flat roof to carry the street-car tracks. At Rio de Janeiro, a 5-mile underground railway (main line and 2 branches) is proposed as an extension of the electric suburban line of the Central Railway of Brazil.

A traffic study by the General Electric Co. is based on the number of passengers rather than number of vehicles. Taking a 60-ft. street, with no parking, the results are: (A) with automobiles only, the maximum capacity in one direction is 2,115 cars per hour, or 3,700 passengers, all seated; (B) with automobiles and busses, 1,215 automobiles (2,130 passengers) and 180 busses (7,200 seated or 9,000 seated and standing) making a maximum total of 11,130; (C) with automobiles and street-cars, the automobiles still number 1,215 (2,130 passengers), but 150 street cars carry 9,000 seated or 13,500 with standees, thus giving a total of 15,630 passengers per hour. Automobiles in city traffic average 1.75 persons per car. Standing passengers in busses average 25 per cent of the number seated, while in street cars they average 50 per cent of the number of seated passengers. Thus maximum rush-hour capacity on this street would be 3,700 people with automobiles only, or 11,130 with automobiles and busses, or 15,630 with automobiles, busses and street cars. See MOTOR VEHICLES.

E. E. RUSSELL TRATMAN.

RECIPROCITY INFORMATION, Committee for. A committee created under the provisions of Section 4 of the Trade Agreements Act of June 12, 1934, which provides that before a trade agreement is concluded with any foreign government interested persons shall have an opportunity to present views to the President or to such an agency as the President may designate. The Committee was created as such an agency, and in 1936 its functions were extended to include receipt of statements with reference to any aspect of the trade agreements program. In 1939 it was placed under the jurisdiction of the Department of State. The agencies and departments represented in the membership have changed from time to time. Chairman: Lynn R. Edminster.

RECLAMATION, Bureau of. A bureau of the U.S. Department of the Interior, which conducts multipurpose irrigation projects in the West. Its 52 projects, 179 dams, and 30 power plants (with an installed capacity of 2,203,962 kw) have created homes for a million people on 4,000,000 acres of irrigable land. Power and municipal water operations serve an additional 4,000,000.

During the fiscal year 1944, plants on Bureau projects produced more than 9,500,000,000 kw-hr of electrical energy. Leading the plants supplying power for war industries are Boulder Dam with a rated capacity of 952,300 in May, 1944, and Grand Coulee Dam with 818,000 kw-capacity. The Bureau investigates water resources in the western United States and constructs and operates irrigation projects. The operating projects are important producers of war foods, forage, and fiber. Crops valued at approximately \$375,000,000 were produced in 1943 on projects watered by Reclamation systems and the 1944 record will exceed that amount. Construction work on new irrigation systems was practically all halted in October, 1942, by order of the War Production Board, but since that time restrictions have been lifted to permit construction on 25 projects under the War Food Program.

To exploit the limited resources of the West, 31 power plants have been built on 19 projects. By June, 1945, these plants had an installed capacity of 2,439,300 kilowatts. During the year power plants on reclamation projects produced 13½ billion kilowatt hours of electric energy.

The scope of the Bureau's work by the end of the 1945 fiscal year included the operation, construction, and authorization for 109 irrigation and multiple-purpose projects, in 17 Western States, including 29 initial projects in the Missouri River Basin, authorized by the Flood Control Act of 1944.

Commissioner in 1945: Harry W. Bashore.

RECONSTRUCTION FINANCE CORPORATION (RFC). The Reconstruction Finance Corporation was created by "An Act to provide emergency financing facilities for financial institutions, to aid in financing agriculture, commerce, and industry, and for other purposes," approved Jan. 22, 1932. These powers have been increased by subsequent legislation. The Corporation may perform all functions it is authorized to perform under law until the close of business Jan. 22, 1947, or such earlier date as the President may authorize.

The Corporation may make loans to public agencies, financial institutions, insurance companies, railroads, drainage, levee, irrigation and similar districts, mining and fishing industries, public school districts or other public school authorities; subscribe for and make loans upon non-assessable stock of banks, trust companies, insurance companies, mortgage loan companies, national mortgage associations, and purchase capital notes or debentures of such institutions; make loans for the carrying and orderly marketing of agricultural commodities and livestock; and exportation of agricultural or other products; and purchase securities from Public Works Administration (q.v.).

War Assets Corporation, a subsidiary of Reconstruction Finance Corporation, has been designated by the Surplus Property Administrator as the disposal agency for Government-owned surpluses of aircraft, industrial plants, capital and producer goods, and consumer goods, constituting nine-tenths of all war surpluses, based on original cost. Under Executive Order 9665, dated December 27, 1945, the lending and surplus property disposal activities of Smaller War Plants Corporation were transferred, effective January 28, 1946, to Reconstruction Finance Corporation and, on the same date, War Assets Corporation will assume responsibility for these activities and will also assume all duties of certifying war veterans as eligible for preference in the purchase of surplus property, a function heretofore served by Smaller War Plants Corporation.

The principal war functions of the Corporation, now being liquidated, included the acquisition of strategic and critical materials by Rubber Reserve Company, Metals Reserve Company, and Defense Supplies Corporation, and the financing of defense plants by Defense Plant Corporation. The above-mentioned national defense subsidiaries were dissolved, and their functions, duties and authorities transferred to the Reconstruction Finance Corporation by Public Law 109, 79th Congress, approved June 30, 1945. Other war functions of the Corporation included the making available, through War Damage Corporation, of reasonable protection against loss of or damage to property, real or personal, resulting from enemy attack; and the making of loans to business engaged in the production of war material.

RFC SUMMARY OF ACTIVITIES FEB. 2, 1932, THROUGH DEC. 31, 1945

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture.....	\$ 2,603,733,430.83	\$ 1,452,180,464.11	\$ 1,451,914,990.45
To open banks to meet demands of depositors.....	1,334,880,161.08	1,138,251,619.27	1,127,742,816.38
For distribution to depositors in closed banks.....	1,422,805,381.24	1,060,157,541.49	1,055,789,788.04
For bank capital (including Export-Import Bank's \$176,800,000 and Federal Home Loan Banks \$124,741,000).....	1,647,452,669.00	1,471,806,311.56	1,094,381,587.46
For self-liquidating projects (including PWA municipal securities).....	1,299,208,298.95	1,074,695,899.18	978,007,210.16
To business enterprises.....	1,063,091,382.87	485,504,511.69	308,370,399.84
For loans to National Defense.....	22,950,253,659.64	21,409,656,163.20	20,746,007,984.30*
For loan to Great Britain and Northern Ireland.....	425,000,000.00	390,000,000.00	138,786,814.17
For purchase of stock—National Defense.....	126,000,001.00	26,000,001.00	20,000,000.00
To drainage, levee and irrigation districts.....	149,434,448.64	101,071,502.18	70,129,522.21
To railroads (including PWA railroad securities).....	1,767,281,871.59	1,052,068,714.70	846,802,937.76
For loans to and capital of mortgage loan companies (including \$25,000,000 capital of The RFC Mortgage Company and \$11,000,000 capital Federal National Mortgage Association).....	912,342,930.95	781,809,214.28	710,209,281.85
For loans to and capital of insurance companies.....	151,589,750.19	137,843,209.81	106,079,865.03
To building and loan associations (including receivers).....	179,989,559.59	140,158,067.90	140,158,067.90
To public school authorities.....	25,689,050.00	23,257,175.00	23,257,175.00
For catastrophe rehabilitation loans.....	17,815,168.36	13,499,235.25	12,035,303.06
To state funds for insurance of deposit of public monies.....	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses.....	19,039,100.00	8,998,409.40	4,998,641.39
For loan to Export-Import Bank.....	25,000,000.00	25,000,000.00	25,000,000.00
For other purposes.....	669,057.07	614,813.85	614,813.85
Total—By Directors of the Corporation	\$36,134,363,636.68	\$30,805,628,485.05	\$28,872,551,830.03
Allocations and loans to other governmental agencies and for relief by direction of Congress.....	4,254,603,216.87	3,801,390,936.51	3,381,121,094.11*
Grand Total	\$40,388,966,853.55	\$34,607,019,421.56	\$32,253,672,924.14

* Includes \$7,650,698,299.91 representing credits arising from the merger of R F C war affiliates with R F C. under Public Law 109—79th Congress. As of December 31, 1945 the Corporation held \$8,866,774,700.49 in commodities, wartime capital facilities and other assets acquired under the merger.

* Includes \$2,785,258,704.21 of Corporation's notes canceled pursuant to Act of Congress approved Feb. 24, 1938.

A summary of activities is presented in the accompanying table. See CONTRACT SETTLEMENT.

CHARLES B. HENDERSON.

RED CROSS, American National. The ending of World War II found the Red Cross at the peak of its activities for the armed forces, and well started in its services to the veterans of World War II. During the war 80 percent of the employees of the American Red Cross were engaged in services to the armed forces. On July 1, 1945, there were 9,400 workers overseas and 9,300 in the United States. Three months later, 9,177 were overseas and 10,194 were on the home front meeting needs arising from demobilization. Of the 138 headquarters buildings constructed in the United States during the war, only 24 had been closed by the end of November. Red Cross services, which had reached into every part of the world where servicemen were on duty, were continued for the armies of occupation. On July 1, there were 820 clubs and rest homes and 500 clubmobiles and other mobile units overseas, and on November 1, 648 clubs and 223 mobile units. Of the 107 in the Pacific, 8 were in Japan. During the war Red Cross camp, hospital, and liaison workers aided 12,000,000 servicemen or their families, overseas and in the United States, and 8,223,000 were assisted by Red Cross Home Service workers; 6,298,000 communications were handled by Red Cross Home Service workers for servicemen, ex-servicemen, and civilians; communities sent 25,000,000 articles to Army and Navy installations through the Camp & Hospital Council, whose program now includes similar service in veterans' hospitals. During the war, the American Red Cross certified 104,400 nurses to the military.

The American Red Cross prepared 27,000,000 packages for prisoners of war and handled 110,000 communications for them. Aid to prisoners of war was made possible through the International Red Cross Committee in Geneva, acting under provisions established by the Geneva Convention of 1929.

Foreign war relief sent abroad from the beginning of the war to July 1, 1945, totalled more than \$148,000,000. The relief supplies were made up of Red Cross supplies and those bought with funds allocated by Congress and resources from other agencies and governments. Red Cross volunteer workers produced more than 31,000,000 garments for foreign war relief in the war period.

The Red Cross Blood Donor Service, inaugurated in February, 1941, at the request of the Army and Navy, completed its mission September, 1945, during which time it had procured 13,326,242 pints of blood from volunteer donors. In 1945, the American Red Cross extended its blood donor recruitment activities by authorizing its chapters to assist in civilian programs under certain conditions.

During the year ending June 30, 1945, Red Cross Claims Service workers assisted 400,000 discharges applying for government benefits. Home Service workers assisted 898,000 ex-servicemen and their families during the war. That 364,448 were aided in the last fiscal year indicates the probable increase in a service that has been continuous since 1917.

In the year ending June 30, 1945, 3,000,000 workers in the Volunteer Special Services gave 175,000,000 hours of work. Their record of work for the war period exceeded 429,000 years of 40-hour weeks, and involved training courses represented in certificates given by the Red Cross: Home Service Corps, 14,438; Nurse's Aides, 194,994; Motor Corps, 42,695; Hospital and Recreation Corps, 55,556; Canteen, 151,027; Dietitian's Aides (1943-45) 9,003; Staff Assistance, 89,672.

During the war the Red Cross gave a total of 1,421,163 certificates to trainees in Home Nursing; 693,557 in Nutrition Courses; First Aid, 7,507,958; Accident Prevention, 32,944; Water Safety, 1,227,293. In cooperation with military medical men, a convalescent swimming program, applicable to a wide range of physical and mental disability cases, was initiated.

In the year ending June 30, 1945, the Red Cross

gave relief in 260 disasters in the United States, giving assistance to 242,000 persons.

The Junior Red Cross, with a membership of 19,905,400 produced 35,000,000 comfort and recreational articles for the armed forces during the war; and for Foreign War Relief up to July 1, 1945, expended \$665,000 from its National Children's Fund, which was used mainly for medical and school supplies, and also sent over a million gift boxes to its contemporaries overseas.

The President of the United States is President of the American Red Cross. Basil O'Connor is Chairman of the Central Committee, composed of 18 members, 6 of whom are appointed by the President to represent the United States Government; 6 are elected by the Board of Incorporators; and 6 by the Delegates of Chapters. Basil O'Connor is Chairman of the Board of Governors of the League of Red Cross Societies, elected to that post for a four-year term at the League's first meeting since 1938, in Paris, Nov. 14-16, 1945.

REFRIGERATION AND AIR CONDITIONING. To the public the real news regarding refrigeration in 1945 was that by the end of the year domestic refrigerators began to appear on the market, although in small numbers. Several additional companies, including a tire manufacturer, announced their entrance into this field so that, when storage cabinets and freezers are included, the number of makers of this type of equipment is astonishingly large. The success of frozen foods, too, brought many new firms into this phase of refrigeration. In connection with frozen foods, headway was made during 1945 in the freezing of pre-cooked foods for the general market, originally begun in 1942. There are now 22 frozen-cooked-food packers now producing baked beans, chicken a la king, chile con carne, pumpkin pie mix, fruit pies, oyster stews and similar foods, all of which need only be warmed for serving, and several of which were first introduced late in 1945. This interest in frozen foods has taken in the refrigerated locker plants which are now adding departments for handling commercially frozen foods. Frozen food retail stores in increasing numbers opened in the larger cities.

The low temperature testing chambers for planes built during the war, called attention to the need for accurate data on the thermal conductivity of insulating materials at very low temperatures. Research at the University of Minnesota showed that the conductivity for all materials tested becomes lower as the temperature of the material falls.

Contamination of food by odors is a matter of concern to many industries, particularly apple storage firms. Studies at Cornell University showed that certain types of odorous volatiles, such as that from pine wood boxes, are related to temperature and humidity, and that activated carbon was effective in combating the odor in apple storage warehouses.

Remarkably, many of the developments of the year concern mobile equipment in one form or another. Georgia Power Co. purchased, for use in Atlanta, the first air conditioned trolley coach. Built by Pullman-Standard, the car will be operated experimentally. The air conditioning equipment, designed by Carrier, weighs 1,500 pounds, and handles 2,200 cu. ft. of air per minute. The first intracity bus, for San Antonio, was shipped in November by A.C.F.-Brill in Philadelphia. This bus, essentially the same as an inter-city recently completed, carries 36 passengers, has a 4-ton (ice-making capacity) conditioner with automatic controls, and is heavily insulated. The war had not yet

ended when the U. S. Maritime Commission had laid plans for the conversion of certain vessels. This included the air conditioning of various quarters on vessels intended for tropical routes.

According to information released in December giving details of the new 64-passenger transport plane *Constellation*, built by Lockheed, this ship and its prototypes will have complete air conditioning. Although it appears paradoxical that cooling should be necessary in the freezing air at high altitudes, the sum of various heat gain components totals to a significant figure. In such planes the pressurizing precludes bringing in too much outside cool air, the heat emitted by lights and passengers is fairly high. Added to these factors, the energy absorbed by the plane in moving through the air at high velocities is conducted in the form of heat into the plane. This heat is absorbed by an air-cycle refrigeration system far more compact than that on a railroad car.

Army engineers, studying Germany's refrigeration industry after that country's collapse, reported two significant accomplishments of the Nazis during the war years. The first was that, as a result of their early experiences in North Africa, a thorough study of tank air conditioning by the Germans finally resulted in their concluding that a hood over each occupant's head, through which a coolant is circulated to keep the veins in the temples cooled, is all that is necessary. Unfortunately for them, the Nazis did not fully develop this theory until Africa was lost. The second accomplishment was their adaptation of the heat pump principle (a refrigeration system arranged so that it can be used for cooling or heating) to thirty large submarines which could voyage from Germany to Japan and back without taking on fresh water. The compactness of the heat pump was a desirable feature of these vessels.

The first to be so treated, the U.S.S. *Brooklyn* has been laid up with her interior protected against corrosion by batteries of dehumidifiers which will automatically remove moisture from the air as fast as it leaks in. The same treatment is planned for literally hundreds of Navy ships and it is expected to be more practicable than the practice of covering machinery with grease. A study of the subject is still under way at the Pennsylvania State College. An additional advance in the art of air drying was the introduction of a dehumidifier employing triethylene glycol as the drying agent. Moisture is absorbed from air passing through a glycol spray, the glycol next being reactivated by heat, then re-sprayed. A small portion of the glycol is carried over into the air stream, but this is considered desirable in the light of the findings by Robertson and others at the University of Chicago on the ability of glycol to destroy air-borne bacteria, particularly those which attack the respiratory organs. Simultaneously, the same manufacturer announced a cooling tower employing no spray nozzles.

CLIFFORD STROCK.

REFUGEES. The year 1945 brought an end to the movement of refugees and displaced persons in Europe, dictated and directed by Germany to meet her desperate needs of manpower for defense. As the Allied and Soviet armies drew together to press home the attacks from the west and the east, the German populations in Poland and East Prussia and the minority Germans in the Balkan States were driven westward in desperate flight. They were to experience at the end of the war the privations and sufferings which had been the lot of the victims of Nazi oppression in the earlier years of

the war. Forced marches on foot in cold weather without food or shelter for days proved for the eastern Germans a prelude to the complete defeat and rout of the German armies. This westward movement extended as far as Denmark in the north, and Austria and Switzerland in the southwest.

Simultaneously those Germans who had fled from the bombed cities of Germany to western Europe during the war were evacuated to Germany in advance of the retreating German forces in the west. It was estimated that the displacement of Germans at the end of war in Germany and Austria exceeded 20,000,000 persons.

Moving in opposite directions out of Germany were the millions of United Nations slave laborers, prisoners of war, and inmates of Nazi concentration camps for whom liberation by the Allied armies provided an opportunity to trek homeward, exhausted, but deliriously happy upon their release. Many thousands found in the concentration camps were too ill to be moved. The ravages of malnutrition and overwork in the camps had taken their toll and for them liberation came too late.

As order was restored in Germany, the occupying military forces organized and assisted the homeward movement of United Nations nationals. Railroads and railroad equipment in Europe had generally been destroyed. Organized movement was by truck and by plane and many thousands proceeded by foot, lacking other means of transportation. By the end of September over 5,500,000 United Nations displaced persons had been repatriated to their home countries from western Germany to find their homes destroyed or farms ruined by the destruction of war.

Included in this total were approximately 2,000,000 Soviet nationals, comparable numbers of French, some 500,000 Belgians, a smaller number of Netherlands nationals and over 600,000 Italians. The repatriation of Poles was delayed by the reorganization of the Polish Government and by the mass movement of Soviet nationals eastward. Some 800,000 Polish nationals remained in Germany at the end of the year awaiting the opening of transportation in the spring.

Other groups remained in Germany at the year's end to bring the total of the non-repatriated to 1,250,000 in the British, French, and United States zones of occupation. These included Latvians, Estonians, and Lithuanians who resisted repatriation because of the political changes which had taken place in their countries, and Yugoslavs unwilling to return to Yugoslavia for the same reason. There were approximately 100,000 Jewish survivors of Nazi concentration camps, over half of Polish origin. German, Polish, and Hungarian Jews expressed preference for immigration to Palestine and indicated determination not to return to their home areas in which they had suffered so terribly at the hands of the Nazis. In December a new movement of Jews from Poland to Germany increased the numbers in this group.

President Harry S. Truman's appeal to the British Government in August 1945 for the admission of 100,000 Jews in Germany to Palestine led to the appointment in December of the Anglo-American Committee of Inquiry which was charged with the duty of making recommendations to the two governments on the possibilities of settlement for Jews in Palestine or in other countries outside Europe. The Committee planned to hold hearings in Washington, London, Germany, and Palestine.

During the course of the year the United Nations Relief and Rehabilitation Administration extended

its services for displaced persons by taking over from the military forces in Germany responsibility for the operation of centers for displaced persons. In 1944 UNRRA had assumed responsibility for displaced persons camps in the Middle East centered at Cairo. From these camps some 27,000 Yugoslavs were repatriated in the early part of the year, while other thousands remained awaiting available transportation. Greek refugees and former residents of the Dodecanese Islands were also repatriated from Cairo. Over 25,000 Polish refugees remained in camps in East Africa, India, Iran, and Mexico until shipping could be released for their return.

President Truman recommended that the 1,000 refugees brought to the United States from Italy in 1944, who were housed in a temporary camp at Oswego, New York, be admitted to the United States under the provisions of the immigration laws. Many thousands of military internees and war refugees in Sweden and Switzerland returned to their countries. However, some 30,000 refugees from the Baltic countries refused repatriation in Sweden, and approximately 15,000 Jewish refugees remained in Switzerland.

Pressures from Poland, Czechoslovakia, Hungary and Austria to evacuate minority Germans who had assisted the enemy during the war resulted in a substantial movement of Volksdeutsche into the reduced area of Germany during the fall of the year. The numbers involved were estimated to be between 6,000,000 and 8,000,000. Although it was not expected that the movement would be completed before the spring of 1946, serious conditions of overcrowding and lack of shelter in Germany were reported. The movement strained the available food stocks in Germany and posed extensive relief problems for the occupying military forces.

The Intergovernmental Committee on Refugees extended relief during the year to stateless refugees, chiefly German and Austrian victims of Nazi persecution in Spain, Portugal, France, Belgium, The Netherlands, and Switzerland, countries in which UNRRA did not administer relief. UNRRA's authority to assist displaced persons in Germany was limited at the Third Meeting of the Council of UNRRA in London in August to a period of six months. The Intergovernmental Committee was preparing at the end of the year to take over the long-term task of finding homes for displaced persons whose repatriation proved to be impossible. The problem of refugees was placed on the agenda of the Assembly of the United Nations which was to meet in January 1946 in London. There appeared little prospect, however, that the United Nations Organization would find it possible to assume such a heavy responsibility so early in its existence.

Announcement was made that the Paris Conference on Reparation had agreed in December that refugees from Nazi Germany and Austria and nationals of countries formerly occupied by Germany, who were victims of Nazi concentration camps, would benefit from a reparations fund of \$30,000,000 to be administered by the Governments of the United States of America, France, The United Kingdom, Czechoslovakia and Yugoslavia in consultation with the Intergovernmental Committee on Refugees. The fund was to be used not for the compensation of individual victims, but for their rehabilitation or resettlement.

The displacement of civilians in the Far East was not less than that in Europe. The estimate of those uprooted by the war in China was approximately 20,000,000. The movement was generally

westward from the coastal areas, although many displaced in the areas of military activity returned to their homes as soon as the military action had ceased. In December the China Overseas Commission, responsible for the return of Chinese to prewar domiciles in overseas countries, reported 184,000 Chinese registered for repatriation. 120,000 of these were located in the coastal region south of Shanghai. Some 31,000 Chinese had already returned to China from Japan.

In addition to the Japanese displaced within their country by the bombing of cities and the dispersal of industries during the war, many Japanese returning to Japan from Manchuria, China, Formosa and the Japanese Mandated Islands were homeless at the end of the war. The total of displaced persons of all nationalities in Japan at the

year's end was estimated to be 12,000,000. The largest group of non-Japanese consisted of 2,000,000 Korean laborers and their families. Their repatriation to Korea began immediately after the end of the war. Included also were unknown numbers of Chinese laborers and some 38,000 Formosan Chinese laborers.

The numbers of Japanese abroad in China, Manchuria, Korea, New Guinea and South East Asia were estimated to be in the neighborhood of 6,500,000. Approximately 2,000,000 were in China, 1,500,000 in Manchuria, 800,000 in Korea and 500,000 in South East Asia. The infiltration of Japanese into countries of the Far East had taken place gradually over a period of years before the war and was intensified during the war. Their repatriation to Japan after the war became a matter

U S RELIGIOUS BODIES HAVING 50,000 MEMBERS AND OVER

(Yearbook of American Churches)

of urgency because of the shortage of food stocks in the areas in which they were found. At the end of the year it was reported that approximately 300,000 Japanese civilians had been repatriated to Japan. The movement was delayed primarily by the lack of available shipping.

GEORGE L. WARREN.

RELIGIOUS ORGANIZATIONS. Church membership in the United States numbered 72,492,669 persons, the largest total in the nation's history, according to the 1945 *Yearbook of American Churches*, published under the auspices of the Federal Council of the Churches of Christ in America. This total comprises 52.5 percent of the July 1, 1944 population of 138,100,874 persons (Bureau of Census estimate). Of the total, 97.4 percent are reported in the 55 religious bodies having 50,000 or more members (see table), with the remaining 2.6 percent of the membership found in 201 other bodies.

The table shows that the majority of the total religious membership is absorbed by three religious groups: Protestant bodies over 50,000—41,943,104 members, Roman Catholic Church—23,419,701 members, and Jewish Congregations—4,641,184 members. (See table on page 503.)

Contributions in gifts and bequests to religion in 1942, the latest survey, reached \$720,800,000, as estimated by the Department of Commerce.

For further information on the larger denominations, see separate articles furnished by an official of each; FEDERAL COUNCIL OF THE CHURCHES OF CHRIST AND JEWISH WELFARE BOARD.

REPRESENTATIVES, U.S. The following list by States of the members of the House of Representatives, 79th Congress, convening in 1946, was taken from the official list compiled by South Trumble, Clerk of the House. The numbers preceding the names indicate Congressional districts, those appearing without numbers being Representatives at Large. Other facts indicated in the type are as follows:

Democrats in roman (242); Republicans in *italic* (190); Progressives in SMALL CAPS (1); American Labor in CAPITALS (1); vacancies (6), 5th Georgia; at large, New Mexico, 19th, New York; 10th, North Carolina; 33rd, Pennsylvania, 6th, Virginia; total 435. Those marked ° served in the Seventy-eighth Congress, those marked † served in a previous Congress, and those marked ‡ are Members elected from newly created or changed districts. In States which were redistricted those marked || were not candidates for renomination and are shown in the district in which they would have been renominated. Those marked § indicate that 2 districts were consolidated requiring 2 incumbent Members to be candidates for the same district in the primary or general election. Predecessors of incoming Members in brackets [].

^k Resigned from the 78th Cong., effective Dec. 7, 1944.

^l Resigned from the 78th Cong., effective Dec. 4, 1944.

^m Elected Mar. 6, 1945, to fill vacancy caused by the resignation of Dave E. Satterfield, Jr., Feb. 15, 1945.

ⁿ Vacancy caused by the resignation of Clifton A. Woodrum, Dec. 31, 1945.

^o No political affiliation, appointed Aug. 10, 1944, to succeed Joaquim M. Elizalde, who resigned Aug. 9, 1944, to serve indefinitely.

^p Popular Democrat, elected Nov. 7, 1944, for 4 years.

REUNION. A French colony, 420 miles east of Madagascar. Area, 970 square miles; population (1941), 220,955. Chief towns: St. Denis (capital), 32,637 inhabitants (1941); St. Paul, 23,055; St. Louis, 20,867; St. Pierre, 20,150. Pointe-des-Galets is the main port. Education (1941): 245 schools and 22,900 pupils. The chief products are sugar, rum, manioc, coffee, vanilla, and spices. Trade (1943): imports 181,674,000 francs; exports 18,923,000 francs (franc was worth about \$0.02 in 1943). Governor: Jean Capagorry.

REYNOLDS FOUNDATION, Inc. A foundation established in 1936 for charitable and civic purposes within the State of North Carolina by the brother and sisters of Zachary Smith Reynolds, deceased. The income from the beginning of the foundation has been used primarily for a campaign to control venereal disease in the State. Annual grants have been made to the North Carolina State Health Department for this purpose. The contribution for 1945, as in 1944, was \$200,000. The book value of the principal of the Trust, as of June 30, 1945, was \$10,023,937.54, which was a little less than its approximate market value. The Trustees are W. N. Reynolds, President, Richard J. Reynolds, Mary Reynolds Babcock, Nancy Reynolds Bagley, W. R. Hubner, Secretary, Stratton Coyner, Winston-Salem, N. C.

ROADS AND STREETS. Highways completed in the United States in the year ending with June, 1945,

totaled only 4,011 miles of all classes, as compared with 5,695 in 1944, 8,445 in 1943, 10,178 in 1942, and 12,936 in 1941. The total includes 3,302 miles of access roads to camps and war industries, 462 miles of the strategic net, and 247 for miscellaneous war purposes. Of road-rail grade crossings, 21 were eliminated and 54 protected by signals or other devices. The total cost of all this work was \$111,062,750, of which 80 per cent (\$89,423,842) was paid by the Federal government. Approval of new projects also fell to a new low level of 2,730 miles.

With war begun, the long-term plans of the Public Roads Administration were shelved, and new construction and normal replacement of worn surfaces were stopped. Increased road traffic for war purposes indicated the need for a postwar program which would meet traffic requirements and also provide employment and stimulate business activity. The Federal-Aid Act of December 20, 1944, authorized \$500,000,000 for each of the first three postwar years to aid the States in their highway work, each State to match the amount assigned to it. Of this sum, \$225 million was for the federal-aid system, \$150 million for secondary or feeder roads, and \$125 million for sections of the federal-aid roads within urban areas.

The above Act also required the designation of two national highway systems: (1) a coordinated system of interstate roads, not exceeding 40,000 miles, to be planned by the P.R.A. and State highway departments; (2) a system of secondary roads, planned by cooperation of the P.R.A., with State and county officials. In February, the P.R.A. requested the several State highway departments to recommend routes for the nation-wide interstate roads. These routes are now being studied in order to provide a system of modern roads connecting cities and industrial districts. They will pass through large cities by expressways, and will be supplemented by radial and belt roads round these cities.

Standards of construction have been adopted but the secondary roads will have different types of low-cost durable surfaces. Traffic on these secondary roads is classed as follows; (A) less than 100 vehicles per day, (B) 100 to 400, (C) 400 to 1,000 vehicles. Since volume of traffic is important in relation to routes and paving, traffic surveys have been made in urban areas of 30,000 to 2-million population. Traffic on rural roads has been studied by means of automatic recorders at 675 locations and by toll-bridge records. In view of controversies over permissible weights of trucks and trailers, California has introduced a scale or "loadometer" which is placed in the road and records the weight upon each wheel of a vehicle passing over it. A special problem is the admitted liability of the Federal government for the cost of repairing roads built for light traffic but badly damaged by heavy military traffic. Reconstruction of war-damaged roads in the Philippine Islands is another activity of the P.R.A.

Practically every State has plans for road construction and improvement, both to meet traffic requirements and to provide a reservoir of employment. Most of these plans include expressways for high-speed traffic between cities. Tolls are favored in some cases for financing individual projects, but are not permitted on Federal-aid work, and are generally considered undesirable. It has been proposed (but negated) to finance, in this way, a 500-mile expressway from New York to Buffalo and Pennsylvania. Tendencies of State legislatures to appropriate for various purposes the

funds derived from vehicle licenses has led to passage of laws prohibiting such diversion. In June, 1945, the governor of Wisconsin vetoed such a law, but it was passed over his veto; in November, a similar law was passed in Kentucky. New Jersey passed a law for a system of expressways for automobiles exclusively.

Many large cities have plans for limited-access roads or expressways to carry fast traffic without interference by local traffic. These roads may be elevated or depressed or on the surface, and connected with the street system only at long intervals. At Detroit, two such projects are financed jointly by the State, county and city. These are the John C. Lodge expressway, running north, and the Cross-town line from the western city limits across the city. The former will be depressed for its 12-mile length. Similar projects at Chicago include an 8-mile line from the lake to the western suburbs. As planned, this is to have (outside of the business district) a depressed line having two four-lane roadways separated by a four-track, rapid-transit railroad.

A toll road from Toledo to Charleston is one of the long-distance projects. The Key West "over-seas" road in Florida may be purchased by the State and made free of tolls. A 95-mile road is

proposed between Dallas and Fort Worth, Texas, and will be depressed to pass through each city. New York has a 5-year program which includes links in its expressways and elevated highways.

In street work, there have been few developments, but maintenance has been stressed to the limit in many cases to keep old surfacing in usable condition. Reconstruction and repaving are immediate needs, and research as to paving materials and methods has continued in spite of difficulties. Wider use is to be made of snow melters and snow loaders to clear streets in winter and thus facilitate traffic. Collapse of a sidewalk at Toledo, Ohio, causing death of a pedestrian, resulted in all sub-sidewalk space being put under city control. Such accidents have occurred in other cities. To relieve traffic congestion, Chicago has considered one-way streets, but a great need in many cities is stricter enforcement of parking regulations on busy streets.

Highway construction in South America is in its infancy, but promises rapid expansion. Many engineers from those countries have been in the United States, either as college students or as visitors. On the 3,300-mile Inter-American Highway, from the United States border to Panama, built with assistance of the United States, there are now 2,487 miles surfaced for all-year automo-

bile traffic and 280 miles for good weather. Trails that are largely impassable total 567 miles.

On the Pan-American Highway, from Panama to Buenos Aires, only limited progress has been made. Its route lies south along the west coast to Valparaiso, Chile, and then over the Andes and directly across Argentina. An alternative route, east of the Andes, runs east from Arequipa, Peru, to LaPaz, Bolivia, and then southeast to Buenos Aires. A branch is to run from Murillo, Colombia, to the Atlantic port of LaGuaira, Venezuela. Engineers from the United States are building government roads in Ecuador, from Quito 100 miles to the Peruvian border; and in Bolivia from Cochabamba (elev. 8,500) 250 miles to Santa Cruz (elev. 1,200), crossing the Andes at 10,000 feet elevation. In Brazil, a 35-mile express road between Sao Paulo and the Atlantic port of Santos, to be completed in 1946, has two 23-ft. lanes, with 8-ft. shoulders and a 10-ft. dividing strip.

In Canada, the U. S. Army is maintaining the Alaska Highway, but Canada will take it over in April, 1946. The agreement provides that the Canadian section will become a part of the Canadian highway system, but open to free use by the United States. Canadian projects include a 330-mile road from the Alberta Northern Railway to the Great Slave Lake and a 150-mile road from the Peace River district to Prince George. Ontario is completing its 250-mile scenic highway along the north side of Lake Superior. In Great Britain, the new government faces the problem of working a system of old and inadequate roads into a system suitable for modern transport. This is complicated by the shifting of population and dispersal of industries under war conditions. The National Road Transport Association was organized in 1945 as a merger of a number of local associations.

In France and Italy a commission of the Allies has carried on extensive reconstruction of war-damaged roads. Turkey has a tentative program for 18,000 miles of roads in ten years, and has sent a group of engineers to study American roads. India has an astonishingly limited road mileage, but seems to have no idea of bringing it up to date. A 300-mile military road was built by the Japanese to connect the highways of Siam and Burma, and thus form a land route for handling supplies, in place of the long sea route around the Malay Peninsula. The U. S. military Ledo Road, in Burma, from the rail head at Ledo to Bhamo on the Burma Road, 400 miles, was opened in January, 1945. It appears that road work will be a marked activity in nearly all countries during the next decade. See BRIDGES.

E. E. RUSSELL TRATMAN.

ROCKEFELLER FOUNDATION, The. Chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." The present program of the Foundation is concerned with the extension and application of knowledge in certain definite fields of the medical, natural, and social sciences, the humanities, and public health.

Medical Sciences. In the medical sciences the Foundation's interest centers mainly on research and teaching in the field of nervous and mental diseases and on the improvement of medical services. Its appropriations in 1945 for work along these lines include \$282,000 to the Roscoe B. Jackson Memorial Laboratory, Bar Harbor, Maine, for studies of genetic factors of emotional variation and intelligence in mammals; \$115,000 to the Uni-

versity of Illinois for research on the biochemical aspects of schizophrenia; \$112,000 to the Harvard Medical School for the development of teaching and research in psychiatry; \$24,000 to Columbia University for the investigation of genetic factors in the incidence of nervous and mental diseases peculiar to old age; \$45,000 to Karolinska Institute, Stockholm, for research in neurophysiology; \$32,000 to the American Psychiatric Association, New York City, for work of its Committee on Psychiatric Nursing; \$250,000 to the Bingham Associates Fund of Maine and the Bingham Associates Fund of Massachusetts for the development of a program of postgraduate medical education in certain rural areas and towns of Massachusetts; \$45,600 to Group Health Cooperative, Inc., New York City, for expenses in operating and developing medical insurance programs; and \$29,000 toward the expenses of Medical Administration Service, Inc., New York City, a voluntary association of laymen and physicians providing information to industries and to government and private agencies which plan or maintain medical care.

Natural Sciences. The program in the natural sciences is concerned mainly with experimental biology. Among the appropriations in this field were \$350,000 to Harvard University for research in the Department of Physical Chemistry of the Medical School on the physical chemistry of the proteins and related substances; \$150,000 to the University of Iceland toward the cost of building and equipping an institute of experimental pathology; \$54,900 to Harvard University for basic studies in chemotherapy; \$75,000 to Karolinska Institute, Stockholm, toward the cost of equipping the Department of Biochemistry and the Department of Cell Research in the Medical Nobel Institute; \$20,000 to the University of Illinois for research in the biochemistry of the amino acids; \$19,000 to the California Institute of Technology for research in immunology; \$15,175 to the University of Leeds for studies on analysis of biological tissues by physical techniques; \$18,000 to the University of Wisconsin for research in the physical chemistry of the proteins of human blood; \$125,000 to the Research Institute for Physics, Academy of Sciences, Stockholm, toward the cost of constructing a cyclotron; \$50,000 to the Massachusetts Institute of Technology for the design and construction of a new high-voltage electrostatic generator for nuclear research.

Social Sciences. In the social sciences, studies of international relations and postwar problems are receiving major emphasis. In general, aid is given to projects contributing to the understanding of important social problems and to the development of personnel and methods. Some of the 1945 appropriations were \$152,000 to the Royal Institute of International Affairs, London, toward the cost of producing a history of the War and the peace settlement, and an additional \$144,000 to this Institute for its research program; \$150,000 to the University of Chicago for the support of research in the Division of the Social Sciences; \$100,000 to the Social Science Research Council, New York City, for fellowships and for reconversion and retraining of social science personnel; \$80,000 to the Council on Foreign Relations, New York City, for continuation of war and peace studies and for its general research program; \$51,030 to the University of Glasgow for development of research and training in the social sciences; \$40,000 to the Institute for Advanced Study, Princeton, toward the expenses of a study of the Law of International Aviation; \$30,000 to Tufts College for an experi-

mental program in the psychiatric approach to training and research in sociology; \$10,000 to the University of California for study of the effects of Japanese migration and resettlement in California; and \$250,000 to Columbia University toward the development of a Russian institute in its School of International Affairs.

Humanities. The program in the humanities is concerned with studies in language and foreign cultures aiming toward better international understanding, with regional studies in the United States and Canada, and with such means as drama, radio, motion pictures, libraries, and museums for raising cultural levels of contemporary society. Grants made included \$155,000 to the National Theatre Conference for support of activities and projects for improving educational and creative values in American universities and colleges through drama; \$90,000 to the American Library Association, Chicago, for the expenses of selecting and purchasing reference books for libraries in war areas; \$25,000 to this Association for exchanges of library personnel within North and South America; \$43,000 to the University Research Fund, São Paulo, Brazil, toward operation of its bibliographical information service; \$50,000 to Stanford University for teaching and research in the areas and languages of the Pacific, Eastern Asia, and Russia; \$25,000 to the American Council of the Institute of Pacific Relations, New York City, for productions of English translations of source materials on Chinese history; \$7,500 to Yale University and a similar sum to the Colorado School of Mines for the purchase of recording and reproducing equipment for language instruction; \$16,700 to the American Council of Learned Societies, Washington, D. C., toward the cost of completing a revised and enlarged edition of Redhouse's English and Turkish Lexicon; \$25,000 to the Rocky Mountain Radio Council, Inc., for expenses and equipment in connection with its work of preparing radio programs of educational and cultural value suited to the needs and interests of the listeners of the region; \$100,000 as a special fund in the humanities for the postwar development of personnel in the United States.

Public Health. The Foundation appropriated \$2,200,000 for the work of its International Health Division. This work includes research on a number of diseases, among them yellow fever, malaria, influenza, typhus fever, rabies, diphtheria, syphilis, tuberculosis, and hookworm infection; demonstrations in the control of certain of these diseases in their environments; cooperation with governments in the organization or improvement of important services of central or local health departments; and the development of public health education. In addition, the foundation made a grant of \$300,000 to the University of Toronto toward the cost of a building for the School of Nursing, and a grant of \$1,000,000 to Harvard University toward the maintenance of its School of Public Health.

Officers. Walter W. Stewart, Chairman of the board of trustees; Raymond B. Fosdick, president; Thomas B. Appleget, vice-president; Norma S. Thompson, secretary; Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; Chauncey Belknap and Vanderbilt Webb, associate counsel. The offices of the Foundation are at 49 West 49th Street, New York City 20.

ROCKETRY AND JET PROPULSION. During 1945 the position of jet propulsion in the aircraft power plant spectrum was further clarified and the veil of secrecy was lifted from a number of American jet and rocket projects. Information on the state of

German progress in this field became available and provided a yardstick against which our accomplishments might be measured. Generally speaking our five years of work has brought us to a position considerably ahead of Germany from a purely technological viewpoint. But from the standpoint of practical military utilization, German jet engines and combat airplanes designed for their installation were ready in substantial numbers long before ours and long before V-E Day. It was only our incessant aerial bombardment of Nazi industry and transportation that prevented the enemy from installing the engines in the airplanes. If either the jet powered planes or the rocket powered robot bombs had gone into action against us just a little earlier, victory for us would have been much slower and more costly.

To evaluate jet propulsion progress in 1945 it is necessary first to examine the various types of power plants in their relation to each other, to other engines, and to the aircraft in which they will be installed.

In the 42 years of human flight mankind has mastered the technique of transversing the earth's closest layer of atmosphere at velocities ranging nearly to the speed of sound. In the development of this technique the power plants of surface transportation have been adapted to aircraft use with remarkable ingenuity. The reciprocating internal combustion engine made flight possible because it was capable of producing power efficiently from a light weight power pack. It reached the peak of its development when it could produce about one horsepower for every pound of engine weight.

In spite of the light weight of modern aircraft engines, each of their cylinders turns out more power than the total output of a heavy automobile engine. But there is a limit to the output of a single cylinder. The aircraft designer cries incessantly for larger engines. The only remaining way to provide them is to add more cylinders with their pistons and connecting rods linked ingeniously to a single crankshaft. Each new row or bank of cylinders adds new mechanical complications and the preservation of reliability of operation amid increasing complexity constitutes a great tribute to reciprocating engine designers' skill.

As man pushes upward toward the stratosphere new methods must be found to pack the rarefied air of higher altitudes into the fuel mixture for the engines. Superchargers for this purpose add new complexities and increase power plant weight. The propeller, which was so efficient down where the air was thicker, must struggle to bite at the thin air of the stratosphere. And so when man is ready to begin the next phase in his emancipation from the earth's surface, his power plant will be the pure jet propulsion engine.

A jet engine is a reaction power plant. It does not depend upon air density for its thrust. Its jet does not push against the air. Its rearward force merely induces a forward reaction like a garden hose trying to move backward along the stream of water flowing within it. So the jet power plant is effective at any altitude.

But because it operates by reaction, the jet is inefficient until the forward speed of the vehicle in which it is installed reaches the rearward speed of the jet. Since the jets produced by gas turbines have a velocity approximating the speed of sound (about 700 m.p.h.) we must have aircraft capable of such speeds if we are to realize the full efficiency of pure jet propulsion. Actually the jet power plant is attractive for aircraft having speeds above about 450-500 m.p.h. At this stage of aviation develop-

ment such speeds are reserved for high performance fighter aircraft and robots or guided missiles.

Aerodynamicists throughout the world are striving to overcome the serious hurdle of compressibility which sets in as an aircraft passes through the neighborhood of the speed of sound. Compressibility destroys the smooth, lift-producing flow of air over the wings and sets up shock waves which batter the wing structure while the craft is passing through the sonic speed range. Until this problem is satisfactorily solved and planes designed for sonic speeds, the pure jet engine will not have a chance to operate at its full efficiency. Rocket propulsion, which provides jets having speeds much higher than those produced by gas turbines, is just so much farther away but it has some immediate applications.

Fortunately the nature of the gas turbine is such that the designer can control the proportion of power which goes to the jet or to the turbine shaft. Thus it is possible to develop a power plant combining both propeller drive and jet propulsion. In such a power unit the propeller can be used where it is most efficient, at speeds up to 450 m.p.h. and altitudes up to about 25,000 ft. At higher speeds and altitudes the propeller can be feathered and the jet set in operation. This arrangement saves the high fuel consumption of the pure jet at low speeds.

An alternative arrangement is one in which the jet-producing function of the gas turbine is minimized and the engine is used chiefly to operate a propeller geared to the turbine-compressor shaft. Practical compromises of these types constituted the most noticeable design trends during 1945. Also noticeable was a tendency toward the axial flow type of gas turbine as compared with the centrifugal type.

A new glossary of jet propulsion engine types was released by the Air Forces during 1945. They are: 1. Turbojet, a gas turbine plus jet; 2. Turbo-prop, a gas turbine plus propeller; 3. Turbofan, a gas turbine plus ducted fan; 4. Motorjet, a reciprocating engine plus ducted fan; 5. Ramjet, a continuous jet with compression by aerodynamic ram; 6. Pulsojet, an intermittent jet.

Gas Turbines with Centrifugal Compressors. Our early gas turbines, the General Electric I-16 and I-40, followed the designs of Squadron Leader Frank Whittle of England and were therefore centrifugal compressor types. Such engines are short and fat and have one stage of compression in which air is thrown off of the compressor blades into channels passing into the combustion chambers. There fuel is introduced and ignited, further expanding the compressed air and forcing it to drive the turbine.

Details of the I-16 (Army J-31) and I-40 (Army J-33) were released by the Army Air Forces late in 1945. Each of these models has a single stage centrifugal compressor connected to a single stage turbine wheel. Air enters the front of the engine through circumferential guide vanes and is sucked in by the impeller. It is compressed to 3.75 atmospheres and forced at high speed into diffuser channels and through adapters to the combustion chambers. The earlier and smaller I-16 has 10 of these chambers or "cans" while the I-40 has 14. Fuel, which may be kerosene, low grade gasoline or fuel oil, is introduced through nozzles into the combustion chambers. Ignition of the fuel results in additional expansion of the compressed air and this hot gas is led to the turbine wheel. Part of its energy is used to turn the turbine which in turn keeps the compressor running. The remainder is

exhausted rearward in the form of a propulsive jet.

Power output of jet engines is measured in pounds of static thrust at sea level because their horsepower varies widely with the speed of the plane in which they are installed. At 375 m.p.h. one pound of thrust equals one horsepower. At lower speeds a pound of thrust yields less than one horsepower; at higher speeds it yields more. Sea level static thrust of the I-16 is 1,670 lb.; of the I-40 is 4,000 lb. The I-16 has a maximum over-all diameter of 41.5 in., an over-all length of 70 in. The I-40 has a diameter 6.5 in. greater and is 31½ in. longer over-all. The I-16 weighs 825 lb. with accessories and about 1,054 lb. installed. The average weight of the I-40 is 1,820 lb. The greatly increased power output of the I-40 over that of the I-16 for only a small increase in dimensions results from the incorporation of the "through-flow" principle compared with the "reverse-flow" pattern of the earlier design. Eliminating the reversal of air flow through the engine greatly increases its efficiency.

First airplane to use the I-16 was the Bell XP-59-A (Aircomet) which was developed simultaneously with the engine in deep secrecy and later was produced by Bell as a jet propulsion trainer. The Lockheed P-80-A (Shooting Star) fighter was designed around the I-40 engine. Neither of these airplanes saw service before the European war ended and, although their power and performance was high, their relatively low range precluded their use in our long-distance Pacific war.

Propeller drive and jet are combined in a later G.E. design, the TG100. This power plant will be installed in several aircraft of new design. Its specifications have not yet been released.

During 1945 an airplane combining a reciprocating engine and turbojet was unveiled by the Navy. The Ryan Fireball (FR-1) has a conventional R-1820 Wright Cyclone engine in the nose with the usual controllable pitch propeller installation. A G.E. I-16 turbojet is installed in the tail and can be operated after the plane has reached a speed where jet propulsion is efficient. Gasoline is used for both engines to avoid fuel system complications.

British strategic air policy emphasizes short range, high performance interceptor fighters for the defense of the Islands. One of their latest designs, the Gloster Meteor IV, captured the world's speed record of 606 m.p.h. during 1945. Its engine is the Rolls-Royce Derwent V, fifth in a line of Whittle-type jet engines developed by Rolls-Royce. The Derwent is a centrifugal compressor type of gas turbine somewhat similar to the two early G.E. designs. Its sea level static thrust is believed to be about the same as that of the I-40. Other British manufacturers are developing planes and engines in this class. Another recent design is the deHavilland Goblin turbojet engine installed in the Vampire Fighter.

Axial Flow Gas Turbines. Axial flow gas turbines are long, thin engines in which incoming air passes straight through several adjacent stages of compression before it reaches the combustion chambers and ultimately the turbine blades. Their multi-stage compressors greatly increase the over-all efficiency of the power unit. Axial flow types were favored by the Germans in their long period of gas turbine development. The Junkers Jumo 004 and the BMW 003 are typical examples. In this country, the first completely American design, the Westinghouse 19-B ("Yankee") belongs to this category.

On the day after Pearl Harbor the Navy requested the Westinghouse Company to develop such an engine and engineers of the Gas Turbine Division completed the design work on several models in record time. It was not until late in 1945 however that some of the details of the Westinghouse 19-B were released. The Yankee is the first all-American designed gas turbine and its brilliant design reflects great credit upon the newly formed Aviation Gas Turbine Division of Westinghouse. Although its length and diameter are approximately one-half of that of enemy axial flow types studied since the war ended, the B-19 develops about 70 percent of their power. Its designers have made important progress in improving the rate of speed of air passing through the engine, the efficiency of combustion, and the length of life of the combustion chambers which had to be replaced very frequently in earlier engines. It is probably the most powerful engine of its size in the world at the present time.

Sea level static thrust of the 19-B is 1365 lb. for a dry engine weight of 826 lb. with accessories. Twenty-one pounds (3 gal.) of lubricating oil are required for operation. Diameter varies from 19 in. to a maximum of 20½ in.; total length is 104½ in.

Like most axial flow types the B-19 has a multi-stage compressor (6 stages), using alloy steel blades and a cast aluminum casing. Combustion chamber details are still secret but the design is known to embody a perforated conical burner ring capable of providing complete combustion at the exceptionally high speed of air flow upon which the engine design is based. A single forging is machined down to produce the turbine disk, shaft, and coupling flanges. Vitalium vanes are used in the turbine nozzle assembly.

General Electric soon will announce a new power plant of the axial flow type. Although still on the secret list the TG180 is known to have a multistage compressor. A number of new airplanes are being designed around it.

One of the latest German axial flow types, discovered in large quantities after V-E Day, is the Junkers Jumo 004, which has a considerably higher power output than the B-19 but is a very much larger engine. Its sea level static thrust is 1,970-1,980 lb., while its maximum diameter is 34 in. or nearly twice that of the B-19. It is 152 in. long. The Jumo 004 has an eight-stage compressor and has been developed with characteristic German ingenuity. Much of the ingenuity however has been devoted to the application of inferior materials, and reflects the shortages in high temperature alloys, which hampered the Nazis during the closing period of the war. An elaborate cooling system replaces the high temperature metals that were unavailable but the cooling system detracts from the thrust power output of the engine. In spite of these disadvantages, the Jumo 004 installed in the Messerschmitt 262 Fighter would have given us considerable trouble if it had gone into action.

Some German jet propulsion planes did go into action toward the end of the war. Chief among these was the Arado twin jet fighter bomber whose engines developed a thrust of 1,600-1,750 lb. Power plant was the BMW 003, of which 750 units were produced up to the end of the war. The 003 has a seven stage axial flow compressor, single stage turbine, and annular combustion chamber. Static thrust at sea level ranged from 1,760 to 2,240 lb. in various versions of the design.

In a desperate last minute effort to develop a combat plane with exceptionally high rate of climb

the Germans mounted a rocket on the 003, designating the new model 003R. The rocket unit delivered 2,750 lb. of thrust for 2 min. and German reports say the resulting performance in climb was sensational. BMW also developed other designs including a very large engine with 12 stage axial flow compressor and 3 stage turbine. It was expected to develop 7,500 lb. sea level static thrust.

Rockets and Rocket Propulsion. Although we have forged ahead of the Germans in gas turbine design, V-E Day found them about a year ahead of us in rocket development. Basic difference between rocket and turbojet is that the former derives the oxygen for combustion from the fuel within it while the turbojet uses the surrounding air for its oxygen supply. Because of the supersonic speeds of jets produced by rockets their use for continuous propulsion must await the advent of aircraft capable of such high speeds or suffer from inefficiency. The advent of the rocket projectile, however has had profound effects on military ordnance development because of its comparatively low weight and absence of recoil. During 1945 the use of rocket power for assisted take-off was further developed for military aircraft and its possibilities for commercial application were considered.

During the closing stages of the European War a high speed rocket powered fighter (Me-163) was used by the Germans. This plane was a flying wing type using liquid fuel stored within its fuselage and wings. It possessed exceptionally high performance as compared with conventional aircraft and was the only rocket powered combat craft to appear during the war.

Power plant of the Me-163 was the Walter 109-509 rocket engine which weighs only 220 lb. dry and develops a maximum thrust of 3,800 lb. This high ratio of power to weight is one of the attractive advantages of rocket engines. Their chief advantage is their high fuel consumption and resulting short duration of flight. Duration of the Walter powered Me-163 was only 12 minutes although it could be extended by shutting the power off at intervals and by using the lowest of three power outputs when the engine was turned on. By this method the flight duration could be stretched to approximately 40 min. Fuel was the usual combination of hydrogen peroxide and methanol.

Several rocket engine projects were under development in the United States during 1945. The Army Air Forces disclosed two models during the year. The XCALT-6000 and the X40ALD-3000 types, produced by Aerojet Engineering Corp., develop 6,000 and 3,000 lb. thrust respectively. Their fuel is aniline and red fuming nitric acid.

Rocket power for controlled missiles demonstrated its practicability in the German V-2 robot bomb which gave us considerable trouble toward the close of the war. Although its accuracy was low, it was a comparatively inexpensive vehicle of destruction and its use under non-flyable weather conditions gave its possessors a considerable advantage. Its thrust was 48,000 lb. for a duration of 71 sec. providing a horizontal range of 200 mi.

The V-2 touched off an extensive program of controlled missile development in 1945. Much of this work is still secret. In addition to our own duplication and improvement on the German designs, a number of other designs were under development during the year.

Rockets for assisted take-off were used on several types of Navy planes during 1945. The Jato unit, developed by Aerojet, is used to boost the power available from the conventional engine during take-off or to provide bursts of speed in flight.

This device enables an airplane to take off with an appreciable overload of fuel or bombs or to take off with normal load from an incredibly small space. Although the high acceleration and the hot jet emitted by rockets are undesirable for commercial operations, the possible use of some sort of assisted take-off to increase pay load of a commercial plane is attractive from the standpoint of air transport economics.

LESLIE E. NEVILLE.

ROSENWALD FUND, The Julius. During the 28 years since its establishment in 1917 by Julius Rosenwald, the Fund has expended approximately \$19,500,000, being all of its income from year to year and about seven-eighths of its principal fund. The Trustees are required to expend all funds within 25 years of the death of the founder, that is, before Jan. 6, 1957. At the close of the fiscal year June 30, 1945, the assets of the Fund had a value of approximately \$2,000,000. The chief program of the Fund during its early years was aid in the building of rural public schools for Negroes. The main programs in 1945 were: (1) Improving the content and quality of rural education in both white and Negro schools in the south; (2) fellowships for Negroes and for white southerners and fellowships in race relations; and (3) efforts to improve race relations, especially the relations between white and colored citizens throughout the United States. During the year 1944-45 the Fund expended \$592,000 upon these and related programs.

ROWING. The big American regattas canceled during the war were not revived last year, but all signs indicated an early revival of rowing in this country. Collegiate action was confined to the East, where Navy, Cornell, Columbia, M.I.T., and Harvard competed, while Princeton boated informal eights late in the summer.

Navy divided two dual regattas with Columbia, defeated Harvard and took top honors in the Spring Day racing at Cornell, winning from the Ithacans, Columbia and M.I.T.

Interest in rowing began to perk up again in England, where Cambridge led Oxford by two lengths in a race that recaptured some of the color of their traditional classics of prewar days. England also revived its Royal Henley on an informal basis.

Youthful Jack Kelly, Jr., son of the famous Olympic sculler, proved the individual star of the season, sweeping three tests in the Canadian Henley, five events in the People's Regatta at Philadelphia, the singles title in the Central States interscholastic championships at Detroit and the Philadelphia schoolboy title.

THOMAS V. HANEY.

RUBBER. As one of the vital factors in the dynamics of war, rubber production and the successful manufacture of synthetic rubber contributed a major share in the defeat of the Axis. As an indication of United States production capacity in synthetic rubber, a record of 668,834 long tons of GR-S, more frequently known as Buna S, met war needs in 1944, while production in Germany never rose above 120,000 tons in any comparable period.

The problem of existing crude rubber supply, and conversion to synthetic rubbers for heavy tire production, grew more dangerous as the war drew to a close. During the summer of 1944 new supply and consumption of crude rubber were approximately in balance. It was anticipated that the situation would remain fairly static except for minor drains from the stock-pile in 1945. However, the

production program was greatly accelerated to meet the schedules of vehicle and aircraft production, causing such a reduction in the stock-pile that crude rubber became the most critical of strategic materials, according to the Rubber Bureau of the War Production Board.

Military needs in 1945 required 144,000 tons of crude rubber. Since imports were so far below consumption this necessitated a 35,000 ton withdrawal from the Government's stock-pile. Requirements were further increased so that the Jan. 1, 1945, stock-pile of 96,000 tons fell considerably below 60,000 tons later in the year, a dangerous minimum for the nation. This figure offers a startling contrast to the stock-pile of 533,000 tons on hand at the time of Pearl Harbor.

Synthetic Production. During 1945 insufficient GR-I (Butyl) to meet over-all tube requirements made it necessary to fill the deficit with GR-S. In turn, however, the increased GR-S requirements in the last half of 1945 were substantially beyond the capacities of the copolymer and raw material plants. The problem was eased by the Government planning additions to the plants amounting to about 3 per cent, or \$22,000,000, of their total investment of \$725,000,000 in synthetic rubber factories. The rated capacity of the Government GR-S plants was 705,000 long tons per year, but the plants have demonstrated a capacity of 860,000 tons.

Component Materials. The increase in 1945 tire production created shortages in essential component materials. Carbon black was critically short for several months. The rayon tire cord supply was found insufficient and, in some tire sizes, was substituted for by cotton tire cord, where enough coarse cotton thread was available. The critical status of bead wire was alleviated by minor expansions in the industry and careful scheduling of production.

As it required 12 to 18 months to build new rayon cord facilities, the manufacturers were forced to use cotton cord at the rate of 1.3 pounds for each pound of rayon cord. This substitution called for the consumption of about one pound of crude rubber for every pound of rayon cord shortage. The problem was further aggravated by the need of cotton cord for tentage and other military supplies.

Advances During 1945. Despite the neglect given synthetic rubber while crude rubber was plentiful, the industry made tremendous strides during the course of the war. The greatest progress was made in the improvement of the various synthetic processes, and reclaim from synthetic stocks even proved valuable as an extender for raw rubber. The chief obstacles in reclaiming centered on sorting the scrap as to the different types of rubber and synthetic, for each type required a different reclaiming method.

In spite of the advances in synthetics, a certain percentage of crude rubber is needed for tire production and the manufacture of other products. To satisfy this requirement, the withdrawal of crude rubber from the available stock-pile was supplemented by shipments from Ceylon, South America and Africa and by continued effort to extract rubber from plants other than the *Hevea brasiliensis*, the original rubber tree. The Department of Agriculture has conducted experiments in guayule, *cryptostegia grandiflora*, goldenrod, dandelion and castilleja. Although much of these "home grown" rubbers have qualities approaching those of *Hevea*, they scarcely compare with its peacetime cost. The search for more and better rubber induced the British, under war conditions, to continue their research facilities

in Ceylon and formulate plans for the rehabilitation of the Malayan rubber-growing areas. In Brazil, where rubber originated, intentions to recapture some of its rubber trade have prompted a new research organization under the guidance of the United States.

Although GR-S remained the strongest factor in the synthetic program, it was found that Butyl (GR-I) was coming into ever increasing use, as outlined by Mr. Ernest Chilton of the Firestone Industrial Products Company in the Jan., 1946, issue of *Rubber Age*. Because Butyl, with its low permeability to gases, proved an ideal material for inner tubes, almost the entire wartime production was absorbed in war materiel. In postwar use, its high hysteresis and great resistance to some oils will make it an important synthetic for many types of mechanical goods.

Mr. Chilton pointed out that several investigators have reported new synthetic rubbers, but most of these inventions are still in the laboratory stage. Some of the most discussed new products are derived from silicone resins. Since they are unaffected by temperatures as high as 450°F. and as low as -70°F., they have already proved useful as gasket materials in airplane engines and bases for heat- and cold-resistant oils.

Even though tires and tubes formed the greatest bulk of rubber production during the war, Mr. Chilton said, the industry produced many remarkable and important war products, many of which became known only after the end of the war. Early in 1940, the Germans attempted to isolate the British Isles by a combination of U-boat warfare and the magnetic mine. Ships could be protected from the latter by an expensive and cumbersome de-Gaussing belt. This, however, did not destroy the mines which remained a potential danger, until the British built a buoyant cable coil in which sufficient magnetic forces could be created to safely explode the mines. Buoyancy was achieved in various ways, one of which was by making the cable center of tennis balls supported in a molded rubber form.

Many of the invasions were aided by collapsible rubber maps that occupied little space when folded, but when opened presented a vivid three-dimensional view of the topography. To supply the advancing troops distant from home source with spare rubber parts, the Navy built a complete small rubber shop on one of the Pacific Islands, capable of turning out 6,000 pounds of molded rubber goods a day. With similar intentions, the Army operated a tire repair shop in Italy that reconditioned as many as 500 tires a day.

In the wartime development of airplanes, rubber products materially aided in the perfection of tires, fuel cells and engine mountings. The more recent developments were designed for propellers and helicopter rotors to aid in cooling the engine, for increasing the propeller efficiency and for protecting the blades from wear.

One of the war's best kept secrets, claimed to have saved 10,000 lives on D-Day in Normandy, was a floating tank known as the D-D Device. Around the sides of a Sherman tank was a rubberized canvas wall reinforced by a steel framework, which was elevated to a height of some 15 feet by means of pneumatic rubber tubes and other mechanical devices. The displacement of this fabric hull made the tank buoyant. When the tank reached its objective, the tubes were deflated, the wall collapsed and the tank was ready for action.

Since the end of the war, new products for civilian use ranged from pneumatic surgical tourni-

quets to foamed rubber powderpuffs. For manufacturing aids, the rubber industry produced Buna N type rubber bondings for abrasive wheels, new heat-resistant forming pads and dies for sheet metal form presses, synthetics for oil seals on rotating shafts, a conveyor belt of neoprene, and fiber-glass and strain gages for the electrical recording of stresses in steel frames.

ROMANIA. A kingdom in southeastern Europe. King: Michael I, who ascended the throne upon the abdication of his father Carol II on Sept. 6, 1940.

Area and Population. The area of Rumania in March, 1945, was about 92,000 square miles and the population was approximately 16,000,000. This includes the restoration (March, 1945) of northern Transylvania (16,641 sq. mi.; pop. 2,573,000) from Hungary but is exclusive of Bessarabia and northern Bukovina which were recognized as parts of the U.S.S.R. and restored the Soviet-Rumanian frontier of June 28, 1940. Chief towns (with 1939 populations): Bucharest (capital) 648,162, Iasi (Jassy) 104,471, Galati 102,232, Cluj 100,272, Timisoara 89,872.

Production. About three-fourths of the population are engaged in agriculture. The kingdom normally produces an export surplus of cereals, livestock, and animal products. Production (in metric tons): wheat, 2,455,000 in 1941; barley, 548,500 in 1940; rye, 91,700 in 1940; oats, 481,800 in 1940; corn, 4,625,000 in 1941; beet sugar, 77,000 in 1940-41; rapeseed, 14,800 in 1942; linseed, 15,100 in 1941; hempseed, 29,700 in 1941; sunflower seed, 222,100 in 1942; soybeans, 21,500 in 1942. The 1939 wool clip was 25,500 metric tons. Livestock in 1942 included 1,102,596 horses (1941), 3,760,000 cattle, 2,400,000 swine, 9,780,000 sheep.

Petroleum produced in 1943 totaled 8,700,000 metric tons. In 1942 natural gas produced totaled 1,545 million cubic meters. Other important mineral products were salt, lignite, iron, and copper. Metallurgical production included cast iron, steel, and rolled iron. The important manufacturing lines were flour milling, brewing, distilling, and oil refining.

Foreign Trade. In 1940 imports were valued at 27,411 million lei (22,846 million in 1939); exports 36,780 million lei (26,809 million in 1939). The main imports during 1940 were iron and its products, machinery, other metals, vehicles, textiles, yarn, chemicals and apparatus, dyes, and drugs. Exports leading in 1940 were petroleum and products, cereals, animals and animal products, wood and its products.

Finance. Budget (year ended Mar. 31, 1944): 177,880,000,000 lei which included both ordinary and extraordinary budget accounts. The public debt on Mar. 31, 1942, amounted to 108,697,700,000 lei, of which internal debt represented 54,281,200,000 lei and external debt 54,436,500,000 lei. Notes in circulation in April, 1945, totaled 450 billion lei. Average exchange rate of the lei: \$0.005 in 1940; \$0.0049 for Jan.-June, 1941.

Events, 1945. The situation in Rumania during 1945 was generally parallel to that in Bulgaria. A Democratic Front government amenable to the U.S.S.R. administered the country, under Soviet direction, while the opposition, largely conservative and nationalist, sought the overthrow of the government and the elimination of Soviet influence. King Michael, whose popularity was so wide and genuine as to elicit considerate treatment from the Russians, provided a rallying-point for the opposition. In the Allied Control Commission the position of the Russian representative

was paramount. The position of British and American representatives was secondary. Their own and their countries' influence was generally on the side of the Opposition, which capitalized on such foreign sympathy as it could obtain. But the Rumanian situation was different from the Bulgarian in that, whereas in Bulgaria racial affinity and a long habit of affection and trust in the Slavic Big Brother seem to have genuinely reconciled the people, regardless of political ideology, to some form of Russian patronage, in Rumania the tradition was rather one of hostility and suspicion, and the nationalist as well as the party basis for opposition was stronger. Hence, though Russian domination made itself unmistakably felt, it must be remarked that the Russians made strong efforts to conciliate public opinion and to preserve the forms of democratic political life. Early in the year there were disagreements concerning Rumania's armistice obligations. Aside from other obligations Rumania was required to deliver to the Russians petroleum products, grain, shipping and rolling stock to the value of \$300,000,000. The Rumanians complained that the removal of equipment and supplies had reduced the country's capacity to produce and distribute even for domestic needs. Prime Minister Radescu publicly declared that "the country's obligations are beyond our powers of execution." The Socialist and Communist Parties resented the implied criticism of the Russians, but General Vinogradov, the Russian head of the Allied Control Commission, showed a conciliatory temper. The Rumanians were allowed to use enemy rolling stock in their country, and further modifications in the economic demands were made so that by June there was no longer any complaint. Similar friction was caused by the Russian demand that all able-bodied Germans in Rumania be transported to Russia for forced labor. It was argued that not only would such a step dislocate the economic life of the country, to which the Germans were vital, but also that it was unjust not to discriminate between "fascist" Germans, and Germans who had actually helped the anti-fascist cause. In general it may be said that the Russians were less eager than their Rumanian followers to introduce social measures that might disturb Rumanian industry.

Shortly before the first of the year Radescu of the conservative Ploughmen's Front had become Prime Minister, but during January and February he was attacked by the growing strength of the left, which was itself, however, too poorly united to enforce its will. The Left gained by the overwhelming victory of the Communists in the Trade Unions Congress elections in February, and it was reported that under Vice Premier Petre Groza it planned a coup. Prime Minister Radescu, even after violence in the Malaxa Works and Left activity in the provinces, sharpened the dissension by abolishing the cabinet posts held by Communists. The U.S.S.R. press and radio took the side of the Left; conservatives in Rumania charged that the Russians were using the Control Commission to end Rumanian independence and continued their efforts to win British and United States support against the U.S.S.R. As a result of demonstrations in Bucharest on February 27 Vice Commissar F. F. Vyshinski forced the resignation of Radescu from the premiership. On February 28 Prince Stirbey was invited to form a government, but on March 1, he informed King Michael that he was unable to do so, and Vyshinski declared for Groza. Michael preserved at least the appearance of constitutional procedure by consulting the various party leaders

before reaching his decision. The Communist leaders approved the choice of Groza, and indicated that they expected all the conservative members of the Radescu Cabinet to be replaced. The Peasant Party leader Maniu refused to sanction Groza's appointment, but Bratianu and Petrescu, the Liberal and Socialist leaders, recognized the expediency of yielding to Soviet pressure and agreed to the choice of Groza provided equitable representation would be given to Peasants, Liberals, and Socialists. It was feared that if Groza were rejected the Democratic Front would seize power by a coup. Michael authorized Groza to form a cabinet, but disapproved of the list presented by him on March 3 on the ground that it did not give the parties representation commensurate with their strength. Subsequently the King was apparently constrained to reconsider his rejection, and so Groza's original list was accepted. The Communists and their closest allies, the Patriots' Union, directly controlled ten of the 32 portfolios and exercised strong influence over the Ploughmen's Front representatives as well as over the remaining ministers, with the possible exception of the four Socialists. The Communist Minister of the Interior, Teohari Georgescu, who had been prominent in the campaign to oust Radescu, was a key figure in the Groza government, being in charge, among other things, of the preparations for the elections. Soviet propaganda organs hailed the new government as an expression of the democratic will of the people, and Marshal Malinovski was quoted by Groza as having promised generous co-operation with Russia. Specifically, Russia would restore northern Transylvania to Rumanian administration, return Rumanian prisoners of war, and help solve the problems of Rumanian agricultural and industrial production.

Groza announced his own program on March 7 as including: (1) Agrarian reform; the expropriation of large estates already carried out by the Democratic Front would be legalized. (2) Economic relief, and reduction in the cost of living. (3) Rapid purge of all branches of the government service. (4) Immediate reorganization of police and gendarmerie. (5) Punishment of war criminals and of those responsible for Rumania's alliance with Germany. Meanwhile the Russians took steps to prevent reaction on the part of Rumanian police and army units by disarming them and taking over the policing of the country almost entirely. In the period between the resignation of Radescu and the inauguration of the new government, the conservative parties encouraged rumors that the United States and Great Britain had intervened in the crisis and would prevent the Democratic Front from gaining exclusive control of the government. American diplomatic representatives in Moscow and Bucharest were in fact instructed to inform the Soviet Government that the United States favored a coalition government in Rumania and would regard a cabinet filled entirely by Democratic Front representatives as contravening the Yalta agreement.

In reply to the American statements Vyshinski declared that the Soviets also favored a coalition cabinet representing all genuinely democratic parties, and that it was essential that such a cabinet be capable of maintaining order behind the Russian lines. Vyshinski stressed that portion of the Yalta declaration which provides for the elimination of pro-fascist forces in liberated countries, apparently including under that category such opponents of the Democratic Front as Radescu, Maniu, and Bratianu. Both British and American

representatives gave King Michael informal encouragement during the negotiations preceding Groza's appointment, and when the left wing press demanded the arrest of Radescu he appealed for and received asylum in the British mission. The Moscow radio criticized the British step only mildly, and reported that Rumanian Government circles were amazed that Radescu should consider himself persecuted. The return of northern Transylvania to Rumania (though its administration remained largely in Russian hands) was celebrated as a great victory for the new regime, which proceeded to consolidate its power by ridiculing the opposition as archaic and arresting some of its leaders, and by contriving that men sympathetic to the regime should displace hostile leaders. Thus, precisely as Dr. Georgi Dimitrov was displaced in the leadership of the Bulgarian Agrarian Party by Petkov and then Obbov, Juliu Maniu was forced from his twenty-five year leadership of the Rumanian Peasant Party by Nicolae Lupu. Strong press censorship and shifts in army assignments were used to silence the opposition. But conservative fears of general expropriations and collectivization proved unfounded. Only the property of condemned collaborators and Germans was confiscated, and industrialists were favored even to the extent that they were exempted from trial as war criminals. The Malaxa plant was restored to its owners, who had a pro-fascist record but were now prepared to support the Communist Party. The Church too lent its support to the new regime. In his statement of October 27 announcing that general elections would be held soon Groza declared that his government did not intend to make risky experiments, that there would be no nationalization of wealth and no "declaration of war against British and American capital." The moderate Communists were disillusioned by Soviet regard for big business and tended to combine with the opposition. The Communists, on the other hand, gained by dissensions within the Democratic Front. The Patriots' Union and the Federation of Labor automatically adhered to the Communists. The Ploughmen's Front (of which Prime Minister Groza was himself leader) was compelled to acquiesce, as were the Socialists, though their leader, C. Titel Petrescu, offered resistance. The conservatism in social questions and also the Church's support of the regime served to reconcile part of the opposition. Despite press censorship and other repressions the regime did in fact allow the opposition considerable scope and was not as ruthless as had been at first charged. In the collaborationists' trials held before the People's Courts in May sentences of 29 death penalties, eight prison terms, and one acquittal were pronounced.

Though adherents of the Groza regime hoped that Rumania would now be granted the status of a co-belligerent, British and American policy opposed such recognition. On August 6, however, General I. Z. Susaikov, acting head of the ACC at Bucharest, presented a statement to Prime Minister Groza announcing Moscow's intentions to resume diplomatic relations with Rumania as a reward for Rumania's contributions to the war effort and her fulfillment of obligations assumed under the armistice agreement. The step bolstered the prestige of the Groza regime, though the United States and British Governments continued to regard it as unrepresentative. Rumanian conservative leaders such as Maniu, Bratianu, and Petrescu, of the Peasant, Liberal, and Socialist Parties respectively, sought to gain the support of the western Allies for a "service" government. Encouraged by the

opposition leaders, by United States and British representations, the Yalta and Potsdam declarations, and the continued unwillingness of Washington and London to deal with the Soviet-sponsored and Communist-dominated Groza government, King Michael asked for Groza's resignation in August. When Groza refused, Michael appealed in writing to the three powers represented in the ACC to assist in the formation of a government which could conclude the peace treaties and be admitted to the United Nations Organization.

The United States and British Governments at once published a favorable reply to the King's request. The Soviet representatives, General Susaikov and Mr. Pavlov, showed their annoyance at the King's measures, of which they had not been informed, and called the intervention of the western powers unilateral and unnecessary. Until this incident Soviet-Rumanian relations had been growing closer. The Soviets had awarded King Michael their highest decoration, the Order of Victory, and Rumania had reciprocated in kind by decorating General Malinovski. Prime Minister Groza, Vice Premier Tatarescu, and other cabinet members, accompanied by General Susaikov, acting head of the ACC in Rumania, and Kavtaradze, Soviet Ambassador to Bucharest, conferred with Stalin in Moscow on September 4. Moscow apparently determined to continue backing the Groza regime, disregarding Michael's complaints and their support by the western Allies, and to bolster the regime agreed to several important measures for alleviating Rumania's economic difficulties. The regime refused to consider any changes in the cabinet, but did seek to conciliate opinion by announcing a reform program to remedy certain conditions which had evoked criticism. The program provided for the completion of agrarian reforms, a revision of governmental machinery and personnel with a view to preparing for genuine elections, abolition of concentration camps and release of all persons not convicted or awaiting trial. Opposition elements in the country were restive, and included moderates among the Communists, who opposed such pro-Russian extremists as Ana Pauker and Vasile Luca, but the regime remained confident that it could weather the storm.

The opposition was disheartened but not slackened by the failure of the Council of Foreign Ministers meeting in London in October to solve the Rumanian crisis. The conference of the Communist Party in the third week of October laid plans for their election campaign and suggested a coalition with the Socialist Party to form a united labor front. The Socialists rejected the bid and reasserted their independence and their criticism of the Communists. The mission of Mr. Mark Ethridge, President Truman's representative, to Rumania, was regarded by the opposition as an encouragement but by the government and press as a mere formality presaging United States recognition. The lifting of censorship on foreign correspondents enabled them to report fully on an impressive demonstration by the opposition in front of the Royal Palace on King Michael's name day, timed to coincide with the arrival of Mr. Ethridge.

By the year's end, however, the opposition's hope of unseating the Groza regime was extremely weak. The announcement on December 22 that the United States and Britain had recognized the Tito government in Yugoslavia led to expectations that the Rumanian and Bulgarian regimes would soon be recognized as well. This seemed well on the way to fulfillment after the meeting of the Big Three Foreign Ministers in Moscow in late Decem-

ber. In the official communiqué issued on December 27, the following decision was announced: The Big Three agreed to advise King Michael to broaden his government by bringing into it a member of the Peasant Party and one of the Liberal Party. This broadened government should then declare for free and unfettered elections. The United States and Great Britain agreed to recognize Rumania when these reforms should have been accomplished. Informed sources stated that the recognition would not necessarily be delayed until the elections had actually taken place. On December 28 it was announced that W. Averill Harriman and Sir Archibald Clark-Kerr, the American and British Ambassadors to Moscow, and Andrei Vyshinski of the Soviet Foreign Office, were preparing to leave for Bucharest to advise King Michael.

RURAL ELECTRIFICATION ADMINISTRATION (REA). An agency created under the Emergency Relief Appropriation Act of 1935 and transferred to the U.S. Department of Agriculture in 1939. Chief: Claude R. Wickard. For a report of its activities in 1945, see **ELECTRIC LIGHT AND POWER**.

RUSSELL SAGE FOUNDATION. A Foundation created in 1907 through a gift of \$10,000,000 by Mrs. Russell Sage, as a memorial to her husband; \$5,000,000 additional was left to the Foundation in Mrs. Sage's will. Its principal purpose is to study social and living conditions in the United States, and to make available to citizens, organized groups, and others such information and proved methods as will assist them to relieve, remedy, or prevent adverse conditions affecting the welfare of their communities. Among the types of activities which in recent years have been carried on by the Foundation's own Departments, or through its grants to agencies with similar purposes, are: adult education, city and regional planning, family welfare, training for social work, study and coordination of community social work programs, studies in the professions, child welfare, leisure-time activities, legal aid, social welfare publications, improvement of race relations, research in the social sciences, methods of relief, improvement of conditions affecting small loans, control of consumer credit, work relations in industry, increasing the public understanding of social work, social statistics, and the relation of the arts to social work. Printed reports of its principal studies are issued by the Foundation, and to assure their greater distribution to interested persons are made available at cost. Among its recent publications are the *Social Work Year Book 1945*, edited by Kurtz; *Law Training in Continental Europe*, by Schweinburg; *Operation Statistics of Selected Family Casework Agencies*, and *Statistics of Medical Social Casework*, by Hurlin, and bibliographies on *Rehabilitation of the Disabled Serviceman and Organized Labor's Participation in Social Work*.

The offices of the Foundation are at 130 East 22 Street, New York 10, N.Y. A social service Library, open to the public, is maintained at the same address. Morris Hadley is President of the Board of Trustees. Shelby M. Harrison is General Director.

RYUKYU (LOOCHOO) ISLANDS. A chain of islands reaching from the Japanese main island of Kyushu to near northern Formosa. They passed under Allied military control partly by conquest in the early months of 1945 and were completely occupied following the surrender of Japan in September, 1945. Area: 921 square miles. Population: 600,-

000 (estimated). Capital: Naha, on Okinawa—the largest island in the group. For an account of the battle in which armed forces of the United States captured Okinawa, see **WORLD WAR**.

ST. PIERRE AND MIQUELON. A French colony comprising two small groups of islands near the south shore of Newfoundland. Area: St. Pierre group—10 square miles; Miquelon group—83 square miles. Total population, 4,120. Capital, St. Pierre. Fishing is the chief industry. Trade (1943): imports 30,338,370 francs; exports 10,259,434 francs. Textiles, wines, salt, and foodstuffs were the chief imports. Cod (fresh and dried) and fish products were the principal exports. Governor: Pierre Garrouste.

SAIPAN. A coral island in the Mariana group of the Japanese Pacific Islands; occupied by United States armed forces in July, 1944. It is about 15 miles long from north to south, and about 4 miles wide. Area, 72 square miles. The population before the war included 40,000 Japanese, 4,000 Chamorras, and 1,000 Kanakas. Garapan, the only town, is on the west side of the island. During peacetime the annual export of sugar was valued at more than \$6,000,000.

SAKHALIN. An island northeast of Japan, in the Sea of Okhotsk. Area, 28,597 square miles. The southern part (south of 50° N.) was under Japanese control from 1905 when it was ceded by Russia in the Treaty of Portsmouth until the surrender of Japan in 1945 when it was occupied by armed forces of the U.S.S.R. According to one of the terms of the Yalta agreement signed by the "Big Three" the southern half of Sakhalin (including adjacent islands), was to be restored to the U.S.S.R. See **KARAFUTO**.

SALVATION ARMY, The. The Salvation Army carried religious and social services to approximately 225 million servicemen and women on 26 fighting fronts during World War II. War urgency needs were met by 3,000 Red Shield Clubs, often improvised huts established on beachheads, in jungles and desert outposts. In the U. S., Salvation Army clubs and those operated through U. S. O. provided personal and accommodation services including mending, wrapping and mailing packages, checking valuables, emergency transportation, financial and legal aid, sleeping accommodations, voice recordings and home hospitality. Salvationists visited approximately 595,000 wounded and sick servicemen in hospitals.

To date, 1,000 mobile canteens have traveled a distance equivalent to 4 times around the world. Many mobiles are equipped with library, radio set, film projector, record player, and can serve 4600 men on one trip. 23 Salvation Army mobile units were attached to the invasion army in France. An auxiliary service to the global land Red Shield canteens was provided in Australia by a motor launch which met sea and land convoys and visited remote outposts on island rivers.

Among recent war-related developments are: a home in France for children whose parents cannot be found; a refugee boys' home and "Warphanage" in China; soldiers' and sailors' rest homes in South America and the Middle East; homes for evacuees, demolition crews and moving units in England after bombings; grocery stores in Canada for stranded families in war boom towns; dining rooms serving meals to war workers' children; restaurants in Belgium for refugees; hostess houses throughout

the U. S. for families and friends of enlisted men.

Evangelical work on the fighting fronts was adapted to circumstances and location. Religious guidance and consolation was given all individuals requesting them, regardless of creed, race or color.

The regular network of rehabilitation services has continued to minister in practical ways to emergency needs of humans.

The year 1945 was marked in the U. S. by a national spiritual campaign; intensification of youth activities; increased war service emphasizing aid to veterans in adjusting to civilian life. The coordination of the work was directed by Commissioner Donald McMillan, National Secretary, National Headquarters, New York City.

SAMOA. A group of 14 islands in the mid-Pacific just below the equator and 4,150 miles southwest of San Francisco. The islands of the group east of 171°W. longitude, called American Samoa, belong to the United States; those west of that line are administered by New Zealand under a mandate of the League of Nations and are known as Western Samoa.

American Samoa. American Samoa includes the island of Tutuila on which the U.S. Naval Station is located; the Manua group, consisting of the islands of Tau, Olosega, Aunu'u, and Ofu; Rose Island; and Swains Island. These islands, with the exception of Swains Island, were acquired on Dec. 2, 1899, through a tripartite agreement with Great Britain and Germany. By joint resolution of Congress, approved Mar. 4, 1925, Swains Island was annexed to American Samoa. All but Rose Island, which is an uninhabited coral atoll, are of volcanic formation. The total area is 76 square miles and the estimated population on July 1, 1941, was 13,273, mainly Polynesian. The seat of government is at the village of Pago Pago, Tutuila, which has the finest harbor in the South Seas. Prior to World War II the population of the naval reservation was about 300; of Pago Pago, 1,000.

The islands are under the control of the Navy Department and are administered by a Naval Governor. Native participation in government consists of a Samoan Council called the Fono which meets annually. Its jurisdiction is limited to advisory functions. Samoans are not citizens of the United States, but owe allegiance to the American flag. Law and order is maintained by the Samoan Guard composed of 36 natives who are enlisted members of the U.S. Marine Corps.

In 1941-42 the average public school enrollment was 2,500, attendance being compulsory for children between the ages of 6 and 15. English is used in public schools and the Samoan language in private schools. Illiteracy in 1930 was lower than in any other U.S. territory—6.3 per cent. Copra, dried coconut meat, is the most important crop. In 1940-41 a total of 862 tons were shipped at a value of \$23,557. Trade (year ended June 30, 1941): \$263,703 for imports and \$93,839 for exports. After May 15, 1941, no unauthorized aircraft or vessels were permitted within three miles of Rose and Tutuila. Governor, Capt. Lawrence Wild, U.S. Navy, who assumed office Aug. 8, 1940.

During 1945 the Hon. Joseph R. Farrington, Delegate from Hawaii, introduced a bill (H.R. 3546) which would extend American citizenship to the natives of American Samoa. Although the Samoans voluntarily ceded their islands to the United States more than 45 years ago, they did not receive the rights of American citizenship as did the Hawaiians, who became citizens with the annexation of the Hawaiian Islands.

Western Samoa. West of American Samoa, less than 100 miles, lies Western Samoa, another group of islands of which the two largest are Savaii and Upolu. Racially and culturally they are similar to American Samoa. Area, 1,133 square miles. Population (July 30, 1941), 62,391, including 58,643 Samoan natives (Polynesians). Capital, Apia, on Upolu. A common indigenous culture and common folkways and mores form the foundation of society in both American and Western Samoa. The natives are Christians of different denominations. There were 12,225 pupils enrolled in the schools in 1941. Copra, cacao, rubber, and bananas are the chief products. Trade (1940): Imports, £165,453; exports, £221,733. For the year ended Mar. 31, 1941, government receipts were £107,980; expenditures, £110,000. During 1940, 100 vessels of 69,475 tons entered the port of Apia.

The United States and New Zealand have taken joint measures for the defense of all the Samoan islands and a large U.S. air base has been constructed on the island of Upolu. Western Samoa is administered by the New Zealand Minister of External Affairs, acting through an Administrator in Apia. On Feb. 24, 1943, A. C. Turnbull was appointed Administrator by the New Zealand Government.

CHARLES F. REID.

SANITATION. While larger cities have sewerage systems and sewage treatment plants, such facilities are lacking or limited in some 10,000 small communities and rural districts, aggregating 30-million population. The U. S. Public Health Service, in cooperation with State health departments, is now preparing an inventory of these and similar needs in such communities. The Service is helping too in the sanitary problems involved in the development of public housing projects. Enlargement and improvement of sewer systems and treating plants are needed in most cities, large and small, and much work of this kind that has been halted by war may soon be resumed. Financing is a troublesome problem, and there is too general a policy of seeking Federal aid. A disconcerting fact in sewage treatment is the discovery of the virus of poliomyelitis (infantile paralysis) in sewage sludge. That is, it has survived passage through the chemical processes, and in the effluent it may reach sources of domestic water supply.

While cities generally encourage the establishment of new industries, warning has been given to consider the character and disposal of wastes, as these may not be amenable to the treatment in the city's sewage disposal plant. Six cities on the east side of San Francisco Bay (Alameda, Albany, Berkeley, Emeryville, Oakland and Piedmont) have approved plans for a joint sewer district. Sanitary districts, as a class of local government units, are having a rapid expansion. Their purpose is to finance, design, build, and operate works for the collection, treatment, and disposal of sewage and industrial wastes.

A tax for use of sewers is being introduced in several cities. For example, Waco, Texas, plans a sewer or garbage tax for revenue, and even proposes to cut off connections if the tax is not paid. But it is doubtful whether health departments or the courts would sustain such drastic action. A county court in Ohio granted a temporary injunction to prevent Columbus from shutting off service to two adjacent communities which had not signed a revised contract with the city. This case has passed to the higher courts. In Pennsylvania, the State supreme court, in October, upheld the au-

thority of the city of Philadelphia to levy a sewer-use tax based on water consumption. Four cities in Virginia finance the building and operation of their sewer systems through service charges which are included in the monthly water bills. Several cities charge neighboring communities for sewer service (as at Columbus, noted above). There are various methods of determining such charges.

Grease and oil in sewage are causing increased trouble in treatment plants. Many industrial wastes also cause extra difficulty and cost in operating these plants, so that special charges are made where these raw wastes are delivered to the sewers or treatment plants. In other cases, the industries are required to treat their wastes before discharging them. In Chicago, the cost of cleaning certain sewers choked by wastes was collected from the firm responsible for the trouble. Another feature of sanitary work is the forced ventilation of sewers, to reduce dangerous gases and offensive odors; also to reduce corrosion of concrete by gases, and to prevent depletion of oxygen in the sewage. Such methods are in use in Los Angeles and in Melbourne, Australia.

There is a growing tendency to make use of gas from sewage digestion. Such gas is used for heating dwellings at Washington, D. C. Sludge gas at Gary, Indiana, provides a large proportion of the power required in the operation of the treatment plant. Engines have been designed which can operate successfully on oil, natural gas or sludge gas.

Collection and disposal of garbage and rubbish is another troublesome phase of municipal sanitation. Collection methods are largely unsatisfactory, as to cost and efficiency. Chicago has approved a bond issue of \$1,500,000 for carrying on this work, and has imposed fines for improper use of garbage cans. In general, municipal collection is preferred to the contract system, the cost being defrayed from general revenue or service charges. Minnesota has a new law permitting the use of service charges, to be included in bills for water supply or sewage disposal.

As to disposal, the most effective method for any individual case depends largely upon local conditions. St. Paul uses garbage for hog feeding. Seattle and Baltimore use sanitary fill, the latter having abandoned incineration in 1944 on account of lack of efficient operators. Incinerators are used at Detroit, Houston, New Orleans, Memphis, etc. Tonawanda, N. Y., has a new incinerator with mechanical stoker, giving a high rate of combustion. Los Angeles County also plans to use incinerators, on account of the smell and smoke at unregulated dumps. Indianapolis has a reduction system, and Newark, N. J., contracts for barge and tug service to carry garbage out to sea. Success with any method depends largely upon efficient operation. In the occupation of Naples, Italy, the sanitary corps of the U. S. Army introduced the sanitary fill or fill-and-cover method, which was effective in eliminating rats and flies at the fill.

A sanitation problem of increasing importance is that of abatement of stream pollution, which is becoming a nation-wide problem. With cities going to new sources to increase their water supplies, they are also increasing the amount of sewage that is discharged. Industrial plants increase the discharge of wastes, and mine drainage may be a serious cause of pollution. A bill for government regulation, in 1936, failed to pass Congress, and later it was shelved by war conditions. In September, 1945, however, similar bills were intro-

duced, with plans for a general program to be prepared by the U. S. Public Health Service.

In Pennsylvania, the State Department of Health is authorized to make grants to municipalities and industries to assist in providing plans for treatment plants. It has ordered some 300 cities and 100 industries to prepare plans for both control of wastes and abatement of pollution. This State is also one of seven cooperating to prevent pollution of the Ohio River. The suit of Illinois against Indiana and certain Indiana cities, for their pollution of Lake Michigan in the area from which Chicago draws its water supply, is still pending. The Potomac River Interstate Commission advises abatement through agreements between the District of Columbia and three interested States.

Michigan, Minnesota, North Carolina, Tennessee, and other States, have "water pollution control" boards or commissions. And the Tennessee Valley Authority is experiencing trouble from pollution of its numerous reservoirs, so that half the people in the T.V.A. district are said to take water from polluted sources. The Colorado State Board of Health has advised construction of several sewage treatment plants, largely in communities which discharge untreated sewage into streams. In the State of Washington, 55 communities have been cited for inadequate or unsanitary sewage disposal. And Columbus, Ohio, faces suits for alleged pollution of the Scioto River. Los Angeles still has its beaches quarantined on account of pollution of the sea from an old sewer outlet; and San Francisco's bond issue for improvements includes means of stopping the city's pollution of the bay.

In continuation of the good-neighbor policy, the U. S. Government is assisting in the much-needed development of sanitary affairs in the countries of Central and South America. This includes engineering and medical advice and financial assistance. Many engineers from those countries are also studying United States methods. The work abroad is handled through the U. S. Public Health Service and the Office of Inter-American Affairs. See Aqueducts, Dams, Water Supply.

E. E. RUSSELL TRATMAN.

SAN MARINO. An independent republic in Italy, near the town of Rimini. Area, 38 square miles; population (1939), 14,545. Capital, San Marino. Chief exports: cattle, wine, building stone. Financial estimates (1939-40) were balanced at 6,009,919 lire. The legislative power is in the hands of the grand council of 60 members elected by popular vote. Two are appointed from this council every six months to act as regents.

SCHOOLS. A report by Francis G. Cornell, Chief, Research and Statistical Service, U.S. Office of Education, showed that preliminary public school enrollment statistics from States for the year 1943-44 indicate a reduction of about 10 percent during four years of war. In 1939-40, enrollments for the continental U.S. were 25,400,000, and average daily attendance was 22,000,000. In 1943-44, enrollment and average attendance were, respectively, 22,700,000 and 19,600,000.

Most of the reduction is attributed to withdrawals of young people into the armed forces, opportunities for employment and a prewar decrease in birth rates. In Apr., 1944, approximately 3,000,000 people of school age, who normally would have been in school or college, were in the armed forces or in the civilian labor force.

Not so well known is the apparent scope of geographical shifts in school population due to an unprecedented high rate of migration of the civilian population. The September, 1945, estimate of the U.S. Bureau of the Census places the average annual intercounty migration for the period 1941-45 at 4,700,000. This is roughly two-thirds more than the equivalent figure of 2,800,000 for the prewar period 1935 to 1940. The impact of this wartime population movement on the school population is indicated by the fact that almost 3,500,000 of the 15,300,000 migrants were under 14 years of age. Relatively large numbers of migrants were adult workers shifting to war production areas. Of the population 14 and over, 12.7 percent were migrants during the war period. Nevertheless 10.8 percent of persons under 14 years of age were also migrants.

The extent of the effect of migration upon interstate school attendance shifts is evident from the high correlation (correlation coefficient of .80) between wartime changes in average daily attendance and wartime changes in civilian population. These data for the 39 States for which statistics are available are shown in the accompanying table. Though the population figures cover a 3-year period only, and are therefore not strictly comparable to the 4-year span of the attendance statistics, the relationship is striking.

WARTIME CHANGES IN SCHOOL ATTENDANCE AND CIVILIAN POPULATION BY STATES

^a Reports were not received from the following States: Arizona, Colorado, Idaho, Illinois, Iowa, Kansas, Montana, New Mexico, Texas. ^b U. S. Department of Commerce, Bureau of the Census. *Population—Special Reports. Series P-44, No. 17, August 28, 1944.*

Summer school sessions in the elementary school level in 142 school systems showed an enrollment total of 48,087 in 1944, a gain of 10.1 percent over the 1943 figure; and on the high school level in 220 systems the enrollment totalled 111,731 as compared with 95,459 in 1943, representing a gain of 17 percent.

In the five years from 1939-40 to 1944-45 there was a decrease of approximately 68,000, about 7.4 percent, in the total number of positions for teachers, supervisors, principals and other instructional staff.

Approximately 168,000 or 20.4 percent of the teaching positions in the fall of 1944 were held by "new" teachers, persons who had not taught in that position the previous year. Approximately 5,000 positions were reported vacant for 1944-45.

From the end of the school year in June 1944 to Oct. 16, 1944, approximately 138,000 teachers left the positions they held in 1943-44 and all but about 50,000, who went to other teaching jobs, left the profession. In addition to about 2,500 who entered the armed forces during this period, over 14,000 women teachers left teaching, for which they had prepared, to take a job in government or industry. Almost as many male teachers left to go into business and industry as into the armed forces during this period.

DECREASE IN NUMBER OF INSTRUCTIONAL STAFF 1939-40 TO 1944-45

School Year	Number	Percent Decrease	
		From Previous Year	From 1939-40
1939-40	911,800
1940-41	907,700	0.45	0.45
1941-42	898,000	1.07	1.51
1942-43	877,000	2.26	3.74
1943-44*	862,800	1.70	5.37
1944-45*	844,100	2.17	7.43

* Estimated.

SCIENTIFIC RESEARCH AND DEVELOPMENT, Office of (OSRD). A United States agency, established by executive order, June 28, 1941, to assure adequate provision for research on scientific and medical problems relating to the national defense. Dr. Vannevar Bush, President of the Carnegie Institution of Washington, is Director. The headquarters are located at 1530 P Street, N. W., Washington, D. C. For details of organization, see 1943 YEAR BOOK.

Reports of progress and of results of OSRD activities, by reason of the nature of their subject matter, have not been generally available. Ultimate publication is dependent upon security declassification by the services. Journal articles are appearing with increasing frequency; a limited number of technical monographs for public use are in preparation.

VANNEVAR BUSH.

SECRET SERVICE, U.S. A division of the U.S. Department of the Treasury, charged with the protection of the President, the suppression of counterfeiting, safeguarding of the money and securities handled by the Government, and the investigation of crimes relating to the Department of the Treasury. (See YEAR BOOK for 1941 for details.) Chief: Frank J. Wilson.

SECURITIES AND EXCHANGE COMMISSION (SEC). An independent agency of the U.S. Government which has the following functions: Supervision of registration of security issues and suppression of fraudulent practices in the sale of securities under the Se-

curities Act of 1933; supervision and regulation of transactions and trading in outstanding securities, both on the stock exchanges and in the over-the-counter markets, as provided in the Securities Exchange Act of 1934; regulation of public utility holding companies under the Public Utility Holding Company Act of 1935; supervision of indentures used in the public offering of new security issues as provided under the Trust Indenture Act of 1939; registration and regulation of investment companies and investment advisers under the Investment Company Act and the Investment Advisers Act of 1940; and the preparation of advisory reports on plans, and participation as a party, in corporate reorganizations under Chapter X of the National Bankruptcy Act. Chairman: Ganson Purcell. See FINANCIAL REVIEW under *Financial Regulation*.

SELECTIVE SERVICE SYSTEM. Procurement of manpower for the waging of global warfare, at the same time leaving sufficient manpower at home to provide a steady flow of war materiel and to protect the civilian economy and social structure, loomed as one of the nation's biggest problems when news came that the Japanese had attacked at Pearl Harbor on Dec. 7, 1941.

The formula had long since been worked out. Enactment on Sept. 16, 1940, of the Selective Training and Service Act authorized the President to establish a Selective Service System, including: a Director of Selective Service; Local Boards; Appeal Boards and agencies of Appeal; "and to utilize the services of any and all departments of the United States Government; to delegate and to provide for the delegation of any authority vested in him under the Act."

The Act provided: "Except as otherwise provided in this Act, it shall be the duty of every male citizen of the United States, and of every male alien residing in the United States, who, on the day or days fixed for the first or any subsequent registration, is between the ages of twenty-one and thirty-six, to present himself for and submit to registration at such time or times and place or places, and in such manner and in such age group or groups, as shall be determined by rules and regulations prescribed hereunder."

"Except as otherwise provided in this Act, every male citizen of the United States, and every male alien residing in the United States who has declared his intention to become such a citizen, between the ages of twenty-one and thirty-six at the time fixed for his registration, shall be liable for training and service in the land or naval forces of the United States. The President is authorized from time to time, whether or not a state of war exists, to select and induct into the land and naval forces of the United States for training and service, in the manner provided in this Act, such number of men as in his judgment is required for such forces in the national interest."

The Act provided that not more than 900,000 men were to be in training at one time, placed a twelve month limitation on length of service unless Congress should declare the national interest imperiled, and contained other provisions making it strictly a peacetime measure, but so constituted that the System it set up would be ready to meet the demands of war, should the emergency arise, with the adoption of a few simple amendments.

The organization formed under the regulations was composed of a Director of Selective Service appointed by the President and responsible to him; State Directors appointed by the President upon

recommendation of the governors of the States; at least one local board in each county or similar political subdivision appointed by the President upon recommendation of the governors; one or more reemployment committeemen attached to each local board to advise and protect veterans in their rights to obtain their old jobs back as provided in the Act; a medical examiner attached to each board; a government appeal agent to carry appeals in behalf of the registrant or the government; and one or more boards of appeal for each state, members of which were appointed by the President upon recommendation of the governor.

The Act's termination date was set for May 15, 1945, except for certain provisions, including especially those having to do with veterans' reemployment rights.

Toward the end of 1944 the Act was extended to May 15, 1946, unless the President shall proclaim, or Congress should declare by concurrent resolution, a termination of hostilities.

The Act was sponsored by the Military Training Camps Association, a group of civilians, but in pattern it closely followed the draft of legislation prepared after many years of study and planning by and under the supervision of a joint Army and Navy committee appointed in 1926 by authority of the National Defense Act of 1917. This committee was successively headed by Maj. George R. Allin, Maj. Frank B. Mallon, Maj. Richard F. Cox, Lt. Col. Sanderford Jarman, and Maj. Lewis B. Hershey.

The committee prepared and supervised extensive correspondence courses for a selected group of reserve officers and National Guard officers on proposed Selective Service legislation and made plans for the raising of manpower to meet any military call. Beginning in 1935, regional conferences were held each year and the planning was minute and detailed.

Consequently, it was only a matter of weeks after passage of the Act when more than 17 million men ages 21 through 35 were registered—with the assistance of more than a million volunteer workers; State and local units were organized and functioning; registrants were filling out classification questionnaires and being classified by their Local Boards; and toward the end of the year, they were beginning to trickle into induction stations.

The four classes and their subdivisions into which the registrants were to be placed were announced three weeks after enactment of the law:

Class I: Men available for military service.

Class II: Men necessary in their civilian activity.

Class III: Men with dependents.

Class IV: Officials deferred by law; those deferred because they were physically, mentally, or morally unfit; ministers and others.

A comparison of these classifications with those which were in effect after the declaration of war, and after the enemy's capitulation, will disclose no basic changes in the system, with the exception of the classification for dependency. Dependency, as such, was later removed as ground for deferment.

Less than a week after the attack on Pearl Harbor, Congress passed a joint resolution removing the territorial restrictions on the use of the Army and, on December 20, amended the Selective Training and Service Act of 1940 with provisions extending the period of military service from one year to the duration of the war, plus six months. Likewise removed was the restriction that limited the number of inductees in training at any one time to 900,000. The registration age was extended by another law from 18 to 65 years. Liability for

service was not extended at that time, however, beyond the 20 to 45 year old group.

Toward the end of 1944 Maj. Gen. Lewis B. Hershey, Director of Selective Service, summed up the manpower situation with the observation that "the pools of young manpower, from which selection can be made for service in the armed forces or for temporary deferment in work supporting the war effort, have dwindled." Adding that both the needs of the armed forces and the civilian activities which support them "have become altered and specialized," General Hershey declared that both were vital for victory and "must be maintained in effective operation." But over and above that, General Hershey stressed that "where there is conflict in their demands, the weight in the decision must be given to the armed forces."

General Hershey complimented the Selective Service System on the fact that considerably more than 30 million men 18 to 45 years old had been registered and classified, that approximately 10 million of those 18 to 38 had been selected and supplied to the armed forces. General Hershey noted with pride that "of the approximately 24,600 Local Board members, who form the front line of the Selective Service System—who serve without pay and must bear the brunt of the criticism which attends all human endeavor, as well as do the bulk of the work—more than 50 percent have been in continuous service since 1940."

On Jan. 1, 1945, the national manpower pool of registrants, ages 18 through 37, was as follows:

Total living registrants	22,084,000
Class I-A	797,000
(Note:—Class I-A figures include men being processed for pre-induction physical examination, postponed inductions, appeals, etc.)	
Class I-A	3,000
(Note:—Men being processed for pre-induction examination, etc., who, without local board approval, have left employment for which they were deferred SS Reg 622.22-2)	
Class IV-F (rejected for military service)	3,592,000
Unclassified	61,000
Classes II-A and II-B (deferred in occupations other than agriculture)	4,198,000
Classes II-A (L), II-A (F), II-B (L), and II-B (F) (deferred in occupations other than agriculture and not qualified for general military duty)	884,000
Classes II-C and III-C (deferred in agriculture)	1,472,000
Classes II-C (L) and II-C (F) (deferred in agriculture and not qualified for general military duty)	132,000
Class III-D (deferred as hardship cases)	51,000
Class I-C (registrants who have become members of the armed forces)	10,753,000
(Note:—Includes a substantial number who have been discharged or transferred to the Reserves. Does not include registrants 38 years of age or over, women, or nonregistered enlisted men, i.e., men enlisted at age 17, etc.)	
All other classes	161,000

It will be seen that at the beginning of the year 5,670,000 registrants, or more than one-fourth of all registrants 18 through 37 years old, were deferred in industry and agriculture, not including 996,000 also engaged in those activities who had been found unacceptable for general military service.

Registrants deferred in essential war production totaled 4,198,000, or 19 percent. Deferments in agriculture totaled 1,472,000, or 6.6 percent. The striking difference between industrial and agricultural deferments, however, was in the age composition of each class.

Of the registrants deferred in agriculture, 23.2 percent were 18 through 25 years old, whereas only 2.6 percent of the men deferred in industry were in that age group. The 26-to-29 group accounted for 19.8 percent of Classes II-A and II-B

(industry) and 20.1 percent of Class II-C (agriculture). Of the industrially deferred, 77.6 percent were over 29 years of age as compared with 56.7 percent of the agriculturally deferred. In Classes II-A and II-B with an (L) or (F) designation, indicating they had been rejected for general military service, 32.1 percent were under 26 years of age, whereas 67.1 percent of Classes II-C (L) and II-C (F) were in this age group.

The cry was for all the physically fit registrants under 30 years of age who could possibly be spared from war industry to meet the needs of the fighting forces, for the Germans had broken through at Ardennes in December, the Germans were fighting with suicidal desperation to turn defeat into victory. Although their defeat was pre-ordained, it still seemed a long way off in January of 1945. In effect, President Roosevelt told Congress, Selective Service and the American people as much. The Army and Navy declared they must have 750,000 men before July 1 of the same year, the best men available.

The Director of War Mobilization and Reconversion furnished Selective Service with the War Manpower Commission's "List of Essential Activities," revised to specify those deemed most critical. This list was subject to change.

Use of this list was recommended to Local Boards as a guide in determining selections for induction among the age group 26 through 29, also that such registrants be called, to the fullest extent possible, in the following order:

- (1) Registrants not employed in an activity appearing on the essential activities list;
- (2) Registrants whom the local board found to be employed in relatively unimportant jobs in essential but not critical activities;
- (3) Registrants whom the local board found to be employed in relatively unimportant jobs in critical activities;
- (4) Registrants whom the local board found to be engaged in relatively more important jobs in essential activities;
- (5) Registrants whom the local board found to be engaged in more important jobs in critical activities.

Local Boards were informed, however, that if a replacement was available for a registrant, he should be classified as available for induction regardless of his place in the groups listed above.

Since requirements of the armed forces were primarily for men under 30 years of age, the local boards were told the test of "regularly engaged in" an activity in support of the national health, safety, or interest or an activity in war production should still be the test applied to a registrant in the age group 30 through 37 or to a registrant of any age who would be classified in Class IV-F were he not employed in a war supporting activity, but who by reason of his employment was classified in Class II-A or Class II-B and identified by the letter (L) or (F). Registrants in the age group 18 through 37 who left the employment for which they were occupationally deferred without the consent of their local board were classified in a class available for service.

Regulations revised in February concerned registrants 18 through 33 and the primary cause was the fact that the supply of men in the most desirable group, under 26, was virtually exhausted and the number of men 26 through 29 was extremely limited.

The revised policy, therefore, anticipated increasing necessity for induction of physically fit registrants over 29 years of age to fill calls, espe-

cially of those under the age of 34, and made distinction in the standards for those 30 through 33 and those 34 through 37. A registrant 30 through 33, to be deferred, had to be "necessary to" as well as "regularly engaged in" an activity in war production or in support of the national health, safety, or interest; while a registrant 34 through 37 need only be "regularly engaged in" such an activity.

A plan to permit occupational deferment of a limited number of men under 30 years of age who held "key" positions in war industry and were indispensable and irreplaceable was worked out by a committee appointed by Director of War Mobilization and Reconversion, of which the Director of Selective Service was a member.

On May 1, shortly before the defeat of Germany, the manpower pool of registrants 18 through 37, was as follows:

	Total	Percent
Total living registrants	22,023,000	100.0
Class I-A	1,024,000	4.6
(Note:—Includes men being processed for pre-induction examination, postponed inductions, appeals, etc.)		
Class I-A	52,000	0.2
(Note:—Men being processed for pre-induction examinations, etc., who, without local board approval, have left employment for which they were deferred.)		
Class IV-F (rejected for military service)	3,253,000	14.8
Class II-A and II-B (deferred in occupations other than agriculture most of whom have not had physical examination)	3,451,000	15.7
Classes II-A(L), II-A(F), II-B(L), and II-B(F) (deferred in occupations other than agriculture and not qualified for general military service)	1,325,000	6.0
Classes II-C and III-C (deferred in agriculture most of whom have not had physical examination)	1,297,000	5.9
Classes II-C(L) and II-C(F) (deferred in agriculture and not qualified for general military service)	241,000	1.1
Class III-D (deferred as hardship cases)	46,000	0.2
Unclassified	60,000	0.3
Class I-C (registrants who have become members of the armed forces) (Note: Includes registrants discharged or transferred to the Reserves. Does not include registrants 38 or over, women, or nonregistered enlisted men, i.e. men enlisted at 17, etc.)	11,119,000	50.5
All other classes (includes public officials, ministers and divinity students, conscientious objectors, and ineligible aliens)	155,000	0.7

In June it was announced that beginning in July there would be a reduction in calls from an average of around 120,000 a month to 90,000, but statistics showed that it would be impossible for Local Boards to fill their calls from among registrants under 26 years of age. The boards were advised, consequently, to "keep watchful eye" on the 26 through 29 age bracket, as well as on registrants 18 through 25 who had been occupationally deferred.

Liberalization of occupational deferment policies also followed defeat of Germany in order to reduce the total number of men to be inducted in the 30 through 37 year old group—particularly those who were fathers and those engaged in work useful to the community. Local Boards were instructed to review the cases of registrants ages 18 through 25 who had previously been rejected for general military service or found qualified for limited service only and to forward for pre-induction reexamination those who they believed might be qualified for military service.

A memorandum sent to Local Boards observed that cutbacks in war plants would make older men available for war production jobs.

Revised requirements provided that to be eligible for occupational deferment a registrant 30 through 33, as well as a registrant 34 through 37, need merely be "regularly engaged in an activity in support of the national health, safety, and interest or useful to the community, or in an activity in war production or in an agricultural occupation or endeavor essential to the war effort." It was previously required that registrants 30 through 33 be found "necessary to" as well as "regularly engaged in" the occupations described in order to be eligible for occupational deferment.

On August 14, the same day that he announced the capitulation of Japan, President Truman lowered the age of acceptability for induction from under 38 to under 26 years old, except for volunteers. The President also decreed a substantial decrease to approximately 50,000 a month in Selective Service calls, and local boards were immediately instructed accordingly.

Later it was announced that all registrants classified II-B, defined as "necessary to and regularly engaged in an activity in war production" would be transferred to Class II-A, defined as a registrant found to be "necessary to and regularly engaged in an activity in the national health, safety and interest." In other words, Class II-B was eliminated.

Definition of the term "national health, safety and interest" was defined to include:

"(1) the production and services required to maintain the armed forces of the United States during the period of the occupation of enemy territory; (2) research, development and manufacturing of weapons or other items necessary to the maintenance of adequate national defense; (3) transportation and other activities required for the demobilization of our armed forces; (4) activities and services required for an expeditious reconversion from a wartime to a peacetime economy; and (5) other activities which the local board considers essential on a national or local basis."

Changes in procedure to be followed by employers requesting occupational deferment of their employees was announced at the same time.

The Local Boards were also instructed to give special consideration under specified conditions to registrants age 18 through 25 pursuing a full-time course of study in medicine, dentistry, veterinary medicine, or osteopathy, until their graduation.

Special consideration was also given registrants in national defense projects and key personnel in reconversion activities.

Other actions taken to liberalize deferment policies for students included: (1) amendment of regulations providing for the postponement of induction of high school students before they were 18 years old, until they were graduated or until they became 20 years of age, whichever was the earlier, with the provision that their course of instruction be pursued "continuously and satisfactorily"; instructions to Local Boards to give serious consideration, under specified conditions, to the occupational deferment request of any registrant accepted by an accredited college or university as a candidate for a Master's degree or a Doctor's degree in the physical sciences or engineer courses; likewise for teachers of the physical sciences and engineering and those engaged in research in accredited colleges and universities.

The Local Boards, in this connection, were told by General Hershey that the demands of long

range national interest require a resumption of the advanced studies for men having enough technical and scientific qualifications and that the deferment plan was set up "in order to fully develop the technical and scientific skills which have been acquired and to provide for adequate teaching facilities for returning veterans who desire to resume their studies in these fields."

Results of a survey showing that the number of male students enrolled in scientific courses in Army and Navy Special Student Programs during World War II virtually offset the loss, through induction, in the number of male scientific students in colleges and universities were released by National Headquarters of Selective Service in December.

The survey revealed that although male scientific students (dental, medical, engineering and veterinarian) declined from 141,346 in 1937 to 53,719 in 1943—a decline of 87,627—the number of students enrolled in scientific courses in the Army-Navy Special Student Programs (ASTP and V-12) totalled approximately 85,000.

On that basis the total number of scientific students, therefore was under 3,000 less in 1943 than in 1937.

In November it was announced that conscientious objectors who had served in Civilian Public Service Camps for 4 years or more, regardless of age, were to be discharged, in accordance with the general plan of demobilization.

All conscientious objectors 38 years of age or over who were assigned to work of national importance had been discharged, and those who had two or more years in Civilian Public Service Camps and who had reached the 35th anniversary of the date of their birth, were being processed for release.

At the end of December there were approximately 7,000 conscientious objectors assigned to the 150 Civilian Public Service Camps and Projects. The peak number was approximately 8500. Rate of discharge was slightly below that of the armed forces.

Close to the end of the year 1945 the approximate manpower picture, registrants 18 through 25, was as follows:

	Total Ages 18-25		Age Groups	
	Number	Percent	18-21	22-25
Total living registrants.....	8,818,000	100.0	3,187,000	4,768,000
I-C.....	6,228,000	70.8	2,220,000	3,843,000
IV-F.....	1,288,000	14.6	526,000	599,000
I-A, I-A-O, I-A, I-A(B).....	312,000	3.5	62,000	49,000
Unclassified.....	133,000	1.5	24,000	48,000
II-A.....	105,000	1.2	35,000	45,000
II-A(L) & II-A(F).....	304,000	3.5	118,000	174,000
II-C.....	225,000	2.6	92,000	101,000
II-C(L) & II-C(F).....	163,000	1.9	73,000	75,000
III-D.....	12,000	0.1	4,000	6,000
I-G, IV-B, C, D, E and obsolete.....	48,000	0.5	15,000	28,000

In June, after the defeat of Germany, but before the fall of Japan, General Hershey declared that the Local Selective Service Boards "have shown the world that democracy can operate as efficiently in war as during peace," and he added:

"I have the utmost confidence that they will continue to function with fairness and efficiency in the even more difficult task presented by increasing demobilization that must be synchronized with continuing mobilization.

"Today, Selective Service has a three-fold task: First, to supply the men needed by the armed

forces to replace those lost in combat and those who are being released after long and difficult service; second, to select men for induction so as to cause a minimum of disturbance to industry, transportation, and agriculture; and third, to restore the serviceman discharged under honorable conditions to his former job or to aid him when necessary in finding new employment."

General Hershey referred to Section 8 of the Selective Training and Service Act, which places responsibility for protecting veterans' reemployment rights on Selective Service and provides for the reinstatement in their former positions of discharged members of the land or naval forces under the following conditions:

That the veteran receive a certificate of satisfactory service; that he still be qualified to perform the duties of his position; that he make application for reinstatement within 90 days; that the restoration be not unreasonable or impossible because of the employer's changed circumstances; that the position held was with a private employer or the Federal government; that the position was other than temporary; that the veteran must have left such a position in order to perform service.

Similar reemployment rights, under approximately similar conditions, have been extended to veterans of the United States Public Health Service and the Merchant Marine in other legislation.

The Selective Service Act provides that after a veteran is restored to his position he shall be considered as having been on furlough or leave of absence during his period of service; he shall be so restored without loss of seniority; he shall be entitled to participate in insurance and other benefits offered by the employer pursuant to established rules and practices at the time he entered service; he shall not be discharged from such position without cause within one year after restoration.

The legislation applies to female as well as male veterans.

The Veterans Assistance Program of the Selective Service System has three main objectives, according to a comprehensive statement issued by Selective Service in September of 1945, as follows:

"(1) To assist veterans of World War II in obtaining reemployment in former positions, or positions of like seniority, status, and pay, and to assist them in obtaining new employment, where desired;

"(2) To furnish information to veterans and to the public regarding rights, benefits, and privileges of veterans under existing Federal, State, and local laws, and to refer inquirers to the proper agency, organization, or person where such rights can most readily be obtained; and

"(3) To stimulate National, State, and community awareness of their responsibilities for providing sufficient job opportunities to accomplish full employment for veterans.

"This program is designed to be carried out through the full cooperation of all Selective Service agencies and personnel, compensated and uncompensated."

There are 55 State Organizations (including New York State Procurement Office), 6,443 Local Boards, and 505 Appeal Boards comprising the Selective Service System.

Near the end of 1945, there were 198,943 persons connected with the System. Of this number 181,707 who were uncompensated were divided as follows: 24,276 Local Board members, 7,889 Government Appeal Agents, 75,827 members of Advisory Boards for Registrants, 28,234 Examining Physicians, 7,394 Examining Dentists, 2,-

514 members of Boards of Appeal, 8,497 members of Medical Advisory Boards, 18,096 Re-employment Committeemen, 8,449 Advisers and Field Agents of the Medical Survey Program, 1 State Director, and 530 Special Advisers and consultants.

On January 1, 1945, executive officers of the Selective Service System were as follows:

Director:—Maj. Gen. Lewis B. Hershey

Deputy Director:—Col. Carlton S. Dargusch

Asst. Director, Presidential Appeals and Advisory:—Col. John D. Langston

Asst. Director, Camp Operations:—Col. Lewis F. Kosch

Asst. Director, Post War Plans:—Col. Victor J. O'Kelliher

Chief Liaison and Legislative Officer:—Col. Louis H. Renfrow

Executive Asst. to the Director:—Col. Campbell C. Johnson

General Counsel:—Col. George H. Hafer

Budget Officer:—Lt. Col. Arthur R. Boone

Chief Information Officer:—Col. James T. Coatsworth

Planning Officer:—Col. William Hart

Adjutant General:—Col. Edmund H. Jones

Presidential Appeals Officer:—Col. John N. Andrews

Medical Consultant:—Col. Richard H. Eanes

Special Assignments Officer:—Lt. Col. Joseph H. Berry, Jr., USMC

LEWIS B. HERSHEY.

SENATE, U.S. The following is an alphabetical list of the members of the U.S. Senate, 79th Congress convening in 1946. Names of Democratic Senators are shown in roman type and Republicans in italic; there is also one Progressive member, LaFollette of Wisconsin. The date of expiration of service is in all cases January 2, of the year named.

The office of President of the Senate, left vacant by Harry S. Truman, has not been filled. President pro tempore of the Senate is Kenneth McKellar; Secretary, Leslie L. Biffle; Majority Leader, Alben W. Barkley, Kentucky; Minority Floor Leader, Wallace H. White, Jr., Maine.

For a list of the Senate of the 78th Congress, see **YEAR BOOK** for 1943, p. 564-5. For the activities of the 78th Congress during 1945, see **UNITED STATES** under *Congress*.

<i>Names</i>	<i>Residence</i>	<i>Service</i>
<i>George D. Aiken</i>	Putney, Vt.	1941-1951
<i>Charles O. Andrews</i>	Orlando, Fla.	1936-1947
<i>Warren R. Austin</i>	Burlington, Vt.	1931-1947
<i>Joshiah W. Bailey</i>	Raleigh, N.C.	1931-1949
<i>Joseph H. Ball</i>	St. Paul, Minn.	1943-1949
<i>John H. Bankhead, 2d</i>	Jasper, Ala.	1931-1949
<i>Alben W. Barkley</i>	Paducah, Ky.	1927-1951
<i>Theodore G. Bilbo</i>	Poplarville, Miss.	1935-1947
<i>Owen Brewster</i>	Dexter, Maine	1941-1947
<i>Styles Bridges</i>	Concord, N.H.	1937-1949
<i>Frank P. Briggs</i>	Macon, Mo.	1945-1947
<i>C. Wayland Brooks</i>	Chicago, Ill.	1940-1949
<i>C. Douglas Buck</i>	Wilmington, Del.	1943-1949
<i>Harlan J. Bushfield</i>	Miller, S.Dak.	1943-1949
<i>Hugh Butler</i>	Omaha, Neb.	1941-1947
<i>Harry Flood Byrd</i>	Berryville, Va.	1933-1947
<i>Homar E. Capehart</i>	Washington, Ind.	1945-1951
<i>Arthur Capper</i>	Topeka, Kans.	1919-1949
<i>E. P. Carville</i>	Reno, Nev.	1945-1947
<i>Dennis Chavez</i>	Albuquerque, N.Mex.	1935-1947
<i>Tom Connally</i>	Marlin, Tex.	1929-1947
<i>Guy Cordon</i>	Roseburg, Ore.	1944-1949
<i>Forrest C. Donnell</i>	Webster Groves, Mo.	1945-1951
<i>Sheridan Downey</i>	Laguna Beach, Calif.	1939-1951
<i>James O. Eastland</i>	Ruleville, Miss.	1943-1949
<i>Allen J. Ellender</i>	Houma, La.	1937-1949
<i>Homar Ferguson</i>	Detroit, Mich.	1943-1949
<i>J. W. Fulbright</i>	Fayetteville, Ark.	1945-1951
<i>Walter F. George</i>	Vienna, Ga.	1922-1951
<i>Peter G. Gerry</i>	Providence, R.I.	1935-1947
<i>Carter Glass</i>	Lynchburg, Va.	1920-1949

<i>Name</i>	<i>Residence</i>	<i>Service</i>
<i>Charles C. Gossett</i>	Nampa, Idaho	1945-1949
<i>Theodore Francis Green</i>	Providence, R.I.	1937-1949
<i>Joseph F. Guffey</i>	Pittsburgh, Pa.	1935-1947
<i>Chan Gurney</i>	Yankton, S.Dak.	1939-1951
<i>Thomas C. Hart</i>	Sharon, Conn.	1945-1947
<i>Carl A. Hatch</i>	Clovis, N.Mex.	1933-1949
<i>Albert W. Hawkes</i>	Montclair, N.J.	1943-1949
<i>Carl Hayden</i>	Phoenix, Ariz.	1927-1951
<i>Bourke B. Hickenlooper</i>	Cedar Rapids, Iowa	1945-1951
<i>Lister Hill</i>	Montgomery, Ala.	1938-1951
<i>Clyde R. Hoey</i>	Shelby, N.C.	1945-1951
<i>James W. Huffman</i>	Columbus, Ohio	1945-1947
<i>Edwin C. Johnson</i>	Craig, Colo.	1937-1949
<i>Olin D. Johnston</i>	Spartanburg, S.C.	1945-1951
<i>Harley M. Kilgore</i>	Beckley, W.Va.	1941-1947
<i>William F. Knowland</i>	Oakland, Calif.	1945-1947
<i>ROBERT M. LAFOLLETTE, JR.</i>	Madison, Wis.	1925-1947
<i>William Langer</i>	Bismarck, N.Dak.	1941-1947
<i>Scott W. Lucas</i>	Havana, Ill.	1939-1951
<i>Warren G. Magnuson</i>	Port Blakely, Wash.	1944-1951
<i>Burnet R. Maybank</i>	Charleston, S.C.	1941-1949
<i>Patrick McCarran</i>	Reno, Nev.	1933-1951
<i>John L. McClellan</i>	Camden, Ark.	1943-1949
<i>Ernest W. McFarland</i>	Florence, Ariz.	1941-1947
<i>Kenneth McKellar</i>	Memphis, Tenn.	1917-1947
<i>Brien McMahon</i>	Norwalk, Conn.	1945-1951
<i>James M. Mead</i>	Buffalo, N.Y.	1938-1947
<i>Eugene D. Millikin</i>	Denver, Colo.	1941-1951
<i>Hugh B. Mitchell</i>	Everett, Wash.	1945-1947
<i>E. H. Moore</i>	Tulsa, Okla.	1943-1949
<i>Wayne Morse</i>	Eugene, Ore.	1945-1951
<i>Abe Murdock</i>	Beaver, Utah	1941-1947
<i>James E. Murray</i>	Butte, Mont.	1934-1949
<i>Francis J. Myers</i>	Philadelphia, Pa.	1945-1951
<i>W. Lee O'Daniel</i>	Port Worth, Tex.	1941-1949
<i>Joseph C. O'Mahoney</i>	Chevenne, Wyo.	1934-1947
<i>John H. Overton</i>	Alexandria, La.	1933-1951
<i>Claude Pepper</i>	Tallahassee, Fla.	1936-1951
<i>George L. Radcliffe</i>	Baltimore, Md.	1935-1947
<i>Clyde M. Reed</i>	Parsons, Kans.	1939-1951
<i>Chapman Revercomb</i>	Charleston, W.Va.	1943-1949
<i>Edward V. Robertson</i>	Cody, Wyo.	1943-1949
<i>Richard B. Russell</i>	Winder, Ga.	1933-1949
<i>Leverett Saltonstall</i>	Boston, Mass.	1945-1949
<i>Henrik Shipstead</i>	Carles, Minn.	1923-1947
<i>II. Alexander Smith</i>	Princeton, N.J.	1944-1947
<i>William A. Starnfill</i>	Hazard, Ky.	1945-1949
<i>Tom Stewart</i>	Winchester, Tenn.	1939-1949
<i>Robert A. Taft</i>	Cincinnati, Ohio	1939-1951
<i>Glen H. Taylor</i>	Pocatello, Idaho	1945-1951
<i>Elmer Thomas</i>	Medicine Park, Okla.	1927-1951
<i>Elbert D. Thomas</i>	Salt Lake City, Utah	1933-1951
<i>Charles W. Tobey</i>	Tempe, N.H.	1939-1951
<i>James M. Tunnell</i>	Georgetown, Del.	1941-1947
<i>Millard E. Tydings</i>	Hyvra de Grace, Md.	1927-1951
<i>Arthur H. Vandenberg</i>	Grand Rapids, Mich.	1928-1947
<i>Robert F. Wagner</i>	New York City	1927-1951
<i>David I. Walsh</i>	Clinton, Mass.	1926-1947
<i>Burton K. Wheeler</i>	Butte, Mont.	1923-1947
<i>Kenneth S. Wherry</i>	Pawnee City, Nebr.	1943-1949
<i>Wallace H. White, Jr.</i>	Auburn, Maine	1931-1949
<i>Alexander Wiley</i>	Chippewa Falls, Wis.	1939-1951
<i>Raymond E. Willis</i>	Angola, Ind.	1941-1947
<i>George A. Wilson</i>	Des Moines, Iowa	1943-1949
<i>Milton B. Young</i>	Berlin, N.Dak.	1945-1951

* Appointed by the governor.

SHIPBUILDING IN U.S. The greatest shipbuilding program ever attempted in world's history was being completed in the United States during 1945. More than any other one thing, ships and still more ships won Global World War II. Without ships—merchant ships more than naval, strange as it may seem—the war in both hemispheres would have been lost by the United Nations to the Axis.

The emergency program for Liberty type ships was concluded Oct. 30, with the delivery of the 2,710th vessel, the S.S. *Albert M. Boe* by the New England Shipbuilding Corporation. The first Liberty ship to be constructed was the S.S. *Patrick Henry*, launched from the Bethlehem-Fairfield Shipyard of the Bethlehem Steel Company in Baltimore, Maryland, Sept. 27, 1941.

From the S.S. *United Victory*, pioneer of the merchant vessels of this type, delivered Feb. 29, 1944, by the Portland yard of the Oregon Shipbuilding Corporation, until the last of the type, the S.S. *Brainerd Victory*, delivered by the same yard Nov. 23, 1945, merchant shipyards turned out 531 Victory ships.

The first T2-SE-AL type tanker was the *ESSO Gettysburg* delivered by the Sun Shipbuilding and Dry Dock Company, Chester, Pennsylvania, Feb. 28, 1942. From the first T-2 tanker until the delivery of the *MacGregill* from the same yard on Nov. 30, 1945, there were 525 tankers of the T2-SE-AL type or modifications built under the U. S. Maritime Commission program.

From Jan. 1, 1942 through November, 1945 there were 5,573 merchant ships of 54,002,123 deadweight tons delivered from all American shipyards.

Contracts for 434 merchant ships remained on Maritime Commission books after cancellation of \$425,000,000 in contracts for 135 ships, and three contracts for special military equipment.

The contracts cancelled covered 35 coastal cargo ships of the C1-M-AV1 type, 42 Victory cargo ships, 24 coastal tankers for Lend-Lease to Great Britain, 4 Liberty cargo ships that were being converted to aircraft repair ships, 8 military type Victory ships, 8 tankers, 5 military transports of the C4 type, 6 refrigerator ships and 3 of the P2 type.

The outstanding contracts, covering virtually all types from small coastal freighters to P-2 passenger-cargo ships, extend into 1946. With the completion of these contracts, the wartime ship construction program will be ended. In the future contracts will be awarded only for ships needed for postwar trade routes. These contracts will be let through competitive bidding, instead of the wartime speed-up procedure of cost-plus.

Reflecting the favorable war aspect at the end of April, 1945, President Truman recommended a cut of more than \$7,000,000,000 in appropriations (\$3,100,000,000) and contract authorizations (\$4,265,000,000) for the Maritime Commission's ship construction program. The Federal Government has built and now owns shipyard facilities costing approximately 2.3 billion dollars, and private shipbuilders have invested additional huge amounts. The wartime investment of the Federal Government is more than four times the total government and private investment in shipyard facilities prior to the war.

Shipyards, however, do not comprise the whole shipbuilding industry. They are the establishments which perform the final assembly, repair, and outfitting of both merchant and fighting vessels. In some instances they also manufacture components and develop design.

The broader industry of shipbuilding in the United States encompasses the manufacture of parts and material throughout the country, as well as the work of designing ships and the assembly and repair of ships in the yards. Every State in the Union contributes something to the building.

At peak wartime activity the entire shipbuilding industry employed an estimated 4,000,000 workers. The manufacturers of the wide variety of materials and components which go into the finished ships are spread throughout the country and employed at the peak of wartime activity an estimated 2,300,000 workers. With the shipyards of the United States located on the shores of the more important rivers, on the Great Lakes, the Gulf Coast and on the Atlantic and Pacific seacoasts, they constitute the greatest concentrations of the nation's shipbuilding activities, and employed the largest single group out of the millions of workers engaged in the shipbuilding industry, having 1,720,000 employees at the peak.

The United States now has a shipyard capacity far greater than it can conceivably use in times of

peace. Since the middle of the nineteenth century this country has not been a leader in shipbuilding. In the last fifty years it has been the world's leading shipbuilder only in the World Wars I and II. During most peacetime years between the two World Wars England led the world in the production of merchant tonnage. In fact, in many years Germany and Japan each built and launched a greater tonnage of merchant ships than did the United States. In the 18-year period between 1920 and 1939 the United States built less than 10 per cent of the total merchant ship tonnage launched in the world.

Rear Admiral Edward L. Cochrane, U.S.N., Chief of the Bureau of Ships of the Navy Department, has given a Navy appraisal of the shipbuilding industry from which the following portions are quoted:

"The fall of 1940 wasn't pleasant to contemplate. British shipbuilding was in jeopardy of capture, as was the British Fleet. Without exception, the important shipbuilding centers of Western Europe were in enemy hands. We needed ships, both fighting and merchant ships. We needed them badly.

"The initial responsibility of saving the world civilization from the bleak disaster staring it in the face was placed squarely upon the shipbuilding industry of the United States and its allied marine industries. . . .

"Our privately owned shipyards have earned the right to be kept in being in peacetime. . . . If we have learned anything from this war, it is that we must never again destroy any facility or special skills that will guarantee us the physical and economic security that future generations have a right to expect as their heritage. . . .

"The survival of American shipbuilding is an essential of national importance second to none."

The production of large merchant types of seagoing vessels over 2,000 gross tons by American shipyards during 1945, while commendable, cannot compare with the tremendous amount of construction during the last six months of 1943, when the peak was reached. However, during the first half of 1945 more than three ships a day were finished.

Prospects for new shipbuilding in the future on a more normal basis are fair. A number of designs have been prepared contemplating the construction of special types of vessels to replace the many that were lost during the war, or radically converted for military use.

October 25, 1944, might have been an important day for the American Merchant Marine, for President Roosevelt requested the Maritime Commission to prepare a "bold and daring" plan for its improvement and to maintain its future position. The President stated emphatically we should lose no time in preparing designs for and constructing such vessels. He urged "immediate inauguration of the program so that this plan could be a factor in employment and the conversion from war to peacetime economy."

The year 1945 passed through eleven and one-half months before this "bold and daring" plan by the Maritime Commission was brought to light before the annual meeting of The Society of Naval Architects and Marine Engineers in New York. It was not so "bold and daring," after all, and instead went back to the early 1920's, right after World War I, in North Atlantic passenger ship design. It went so far as to predict that "ultimately, it is believed that the water transportation of passengers will be so decreased as to become rather a minor factor outside the 'cruise' for relaxation and recreation."

Then this study made under The President's directive demanding "a departure from precedent" proclaimed that "the period of usefulness for such ships should extend through a couple of decades."

The year may take just pride in the fact that on March 1, at exactly 10:16 o'clock in the morning Pacific Coast time, the keel was laid for the first vessel to be built for a foreign power in the United States in more than twenty-two years. This historic keel was for the first of twenty cargo ships costing approximately \$8,000,000 ordered from the Albina Engine and Machine Works, Portland, Oregon, by The Netherlands East Indies Government. This contract, the first big peacetime order for foreign ships, was an announcement that Portland, Oregon, can compete with the world in shipbuilding, and the enterprising shipbuilder and designer is the Pacific Coast industrialist, L. R. Hussa, who was building ships way back when Henry J. Kaiser was building highway roads in our Northwest. Hussa is continuing to build ships, without benefit of Federal Government financing.

March witnessed the launching of the first 45,000-ton carrier to be built for the United States Navy, the U.S.S. *Midway*, in the Dravo-created Submerged Shipway at the Newport News Shipbuilding and Dry Dock Company's yard, Newport News, Virginia. This giant graving dock, a Navy secret since it was built in 1941, may be put down as an outstanding development in shipbuilding for 1945. When the great battleship U.S.S. *Washington* was launched on June 1, 1941, some 25,000 persons witnessed the ceremony. If these spectators had paid \$10.00 each for the privilege, as theatergoers did in principal cities from Coast-to-Coast to see and hear the great Spanish "Duse of Song," Señora Raquel Meller in 1926, the receipts would barely have covered the actual expense of preparing the launching berth for the thrilling moment when the mighty hull slid down the inclined ways. The sum of about \$250,000 is required for the necessary blocking, cradles, greasing, and other expenses incidental to preparing a ship of battleship size for launching on inclined ways.

This actual launching expense is only one of a number of shipbuilding costs which are eliminated or substantially reduced when a horizontal shipway is used instead of inclined ways for ship construction, and the completed vessel is floated, rather than launched.

When the Newport News Shipbuilding and Dry Dock Company, noted for its superior skill in building fine ships, and for its outstanding ability in devising new techniques in the art of shipbuilding, was called upon by the United States Navy to build the largest types of aircraft carriers, it had to formulate plans for constructing new facilities. The courage of the Newport News management in adopting a new and unique type of horizontal shipway for launching by floating, as proposed by Dravo Corporation, successfully culminated in the construction of the new shipways at a cost one-third as great as the conventional massive concrete graving docks of similar size. With such horizontal shipbuilding basins a ship may be launched or a hull put back in service by a simple operation of turning a valve which floods the basin. With a horizontal shipway a yard is always ready to build new ships or to repair or modernize existing hulls.

The beginning of 1945 witnessed the commissioning and operation of the first of four ice breakers of the "Wind" class, bringing to the U. S. Coast Guard fleet an unusual and useful type of vessel. A bow propeller driven by a 3300 h.p. electric motor creates a wave ahead of the vessel

that helps break the ice. A "V" in the stern simplifies pushing when the going gets tough. Water-tight bulkheads separate engine rooms so flooding can knock out only one at a time. Six Diesel-driven generators supply power to two stern and one forward propellers.

One unique feature of these vessels is the installation of a propeller in the bow in addition to the stern propellers. The bow propeller is for ice-breaking purposes only.

Mention might be made of the possibility of the reversible propeller. While variable pitch or feathering propellers are not new, developments along new designs are being brought forth, largely because of their feasibility with machinery not readily reversible.

A notable step was taken in the development of the gas turbine. While it still may be considered in the experimental stage, it has been the subject of a great deal of investigation and probably will soon be put into practical application. Its possibilities are surprising.

No radical changes in hull designs or particular advancements that have not previously been mentioned have been brought out. Progress along these lines is of necessity slow.

WENDELL PHILLIPS DODGE.

SHIPPING. Science and engineering as applied to shipping reached their all-time pinnacle in 1945. Aside from providing the weapons to win the greatest of wars in world's history, the power which opened the atomic age was loosed and both sea and air navigation developed to a point insuring greater safety.

Radar, the very mention of which because of wartime necessity was soft-pedaled until V-J day and taboo to the extent almost of high treason, is going to make sea and air navigation entirely continuous and foolproof, regardless of night or weather. This "electronic navigator" can detect through darkness, fog and storm the position of any above-water obstacles, such as icebergs, other ships and land, buoys and lighthouses, at distances up to thirty miles, depending upon the size and shape of the object.

The basis of the "electronic navigator," or radar used at sea is a rotating antenna located on the top deck of the ship and analogous to a searchlight, in that it sends out beams to locate obstacles in the ship's path. The difference, however, is that beams from the radar antenna, which are actually powerful radio microwaves, are capable of penetrating fog or any other atmospheric conditions without hindrance. Moreover, they are sent out as "pulses" or surges of extremely short duration and at a very rapid rate.

The United States Navy gave radar the hardest work-out test possible or even conceivable in The Aleutians, "Cradle of Storms." Here the Pacific Ocean with its warm Japan current coming in contact with the cold Arctic current flowing through the Bering Sea rapidly condenses, at different temperatures, causing masses of air to be constantly sucked through an 1,800-mile arc of high mountains and narrow passes of the volcanic rift of the Alaska Peninsula, reaching storm intensity quickly.

And radar has helped immeasurably to guide our commercial ships and airplanes through fogs and storms. Consider, for instance, that in 1943 more than 4,000,000 tons of cargo space were lost on the Great Lakes alone as the result of fog.

Early in the war it was realized that an accurate and reliable navigational aid was essential to ensure coordination to prevent needless loss of ships,

aircraft, and the crews aboard as a result of enemy action. As a result of intensive research and development, Loran was born. This system has long been one of the Coast Guard and Navy's carefully guarded war secrets because it was used primarily by navigators who were in action against the enemy, both in Europe and Asia. However, Loran is of equally great importance as a peacetime aid to navigation.

Work was commenced on Loran in 1941 and by the end of 1942, the first of the ground stations which were later to lace the world with the electronic lines of position were operating. First stations were set up in the North Atlantic area by the U. S. Navy in cooperation with the National Defense Research Council, and were eventually taken over completely by the Coast Guard.

The North Atlantic chain was established in mid-winter of 1942, during the Battle of the Atlantic, and the Aleutian chain, later in the same year and in the spring of 1943. The intensity of weather and the rough terrain made the establishment of these stations a hazardous operation. Electronic experts of the Coast Guard aided in the construction. Loran stations were later set up and operated in the Pacific area. Thus, service is now afforded navigation along both coasts of North America, along the busy Great Circle courses of the North Atlantic and North Pacific, and in the central and southwest Pacific, where pin-point navigation is essential.

Loran provides quickly and accurately, in any type of weather, data which enable the navigator to establish his position in a matter of a few minutes. There are, at present, no other navigational aids which will give the navigator the same consistent fixes relative to transmitting units under all conditions. The more common direction finding systems, even after 25 years of service, cannot offer such dependability because of certain inherent factors in the propagation of radio waves which limit their capabilities.

Loran is inherently a good system because only the dependable and stable factors of radio wave transmissions are utilized. There is no dependence placed on the apparent direction from which the signal approaches as in ordinary direction finder equipment. Direction indication in radio is subject to error when the wave travels over land masses or there is interference from sky waves. The velocity of an electromagnetic wave is considered constant for all practical purposes, there being only minute variations in the air. This is important because the time of travel may be measured accurately and so the distance may be exactly determined.

Heretofore, it has been usually considered unnecessary to have accurate positions while great distances from land. Because of the war, accurate fixes became necessary to enable convoys and air cover to rendezvous quickly and accurately. Another wartime use, and equally important peacetime employment, has been the location of ships and planes in distress. By giving Loran coordinates rather than geographical ones, craft in distress may be located much more easily because it becomes unnecessary for the navigator to compute drifts, sea currents, winds, etc. The searching craft simply sets the course on his receiver which keeps him on the Loran line of position of the craft in need of assistance.

Loran operates on a new principle, using pulsed transmission so that time differences can be accurately measured. Briefly, the theory of operation is as follows: It is known that an electrical wave travels about one nautical mile every 6.185 mil-

lionths of a second. Using this as a basis of computation it may be seen that if the amount of time required for an electromagnetic wave to travel from the transmitter on shore to the receiver aboard a ship, then the distance the wave has traveled may be readily computed.

The present Loran has a daytime range of from 600 to 800 miles. However, at night when transmitting conditions are good and the ionosphere may be utilized to reflect radio waves, the effective range increases to 1,400 or 1,500 miles. The use of the reflected waves at night requires some skill at matching the signals, but with a little practice an operator can master the technique. The accuracy may be eventually increased to one or two miles at 1,000 miles from the station. The service area of the present standard Loran is only 1,000,000 square miles for a chain of three stations (two rates) but this will be increased to about 5,000,000 square miles when the new Loran is ready for use. To get good coverage over all the important sea lanes of the world would require only about seventy stations.

There is only one factor which seriously affects Loran compared to the many for all other systems. This is that of serious electrical disturbances. These include electrical storms, variation in elevation of the E and F layers, and the general random noise always present which sometimes increases in intensity because of precipitation. However, these atmospheric disturbances must be quite serious before Loran becomes unusable.

This world-wide installation has assumed international aspects both as to location, operation, and maintenance. The system is now operated by three major nations and is available to any vessel properly equipped regardless of the flag it flies. The international aspect may expedite the standardization of maritime procedure where communications and navigational equipment is concerned. At the present time, the U. S. Coast Guard is responsible for the operation and maintenance of most U. S. stations, but all funds necessary have not yet been provided to carry on this duty as a peacetime responsibility. Whether the existing installations will be maintained, reduced, or additional stations installed, is a question of the future depending not only upon national decisions, but also international agreements.

Besides its dubious prophecies concerning the future of ship passenger travel as compared with planes, the U. S. Maritime Commission made this official analysis of the North Atlantic trade route, always the heaviest in the world:

"Route (A), while classed as 'essential' and while the scene of the most spectacular ship operation of the century just past, is highly competitive and probably cannot offer to American interests the opportunities in future passenger transport development offered elsewhere."

According to the poll conducted from a cross section of the American people by the Shipbuilders Council of America, England and the Channel ports will be the favored destination of 21.57 per cent of the prospective travelers who revealed their plans; 11.18 for Mediterranean ports; 5.63 for Baltic ports; 12.99 for the East coast of South America; 9.07 for the West coast of South America; 8 to the Far East and Australia; 7.47 from East to West coasts of the United States, or vice versa, via the Panama Canal; 11.31 to Hawaii and other Pacific islands; 10.91 to Cuba and the Caribbean; 1.87 to other ports.

The astonishing thing is that at long last, 65.14 per cent of those asked will travel on American

ships by preference, while 12.54 will choose foreign ships.

There are many indications of a pent-up desire for foreign travel, the survey indicated. Before this war, only about .0592 per cent of Americans went abroad annually.

Throughout most of 1945, virtually all American shipping was in the hands of the Government, our ship operators merely running vessels for the War Shipping Administration. On June 30, 1945, world merchant shipping totaled 69,335,000 gross tons (compared with 60,607,000 gross tons, June 30, 1939), of the foregoing 1945 total the United States merchant shipping represented 36,213,000 tons (8,672,000 in 1939), the British Empire 15,826,000 tons (18,833,000 in 1939), Norway 2,813,000 tons (4,553,000 in 1939), Netherlands 1,576,000 tons (2,728,000 in 1939), Japan 1,526,000 tons (5,255,627 in 1939).

As a first step toward getting American private ship operation under way, the end of December brought forth Maritime Commission plans to provide interim passenger service in the Pacific through the conversion of two P2-S2-R2 type transport vessels for passenger use. Originally completed as troop carriers assigned to the Navy, the vessels will have completed present assignments to troop movement early in 1946.

Combination passenger-cargo ships carrying fifty-two passengers and a crew of seventy-six, with passenger accommodations and public rooms air-conditioned throughout, as are the crew mess-room and recreation quarters, provide the first application featuring such passenger accommodations in the Latin American trade.

In order to hold our share of postwar ocean passenger traffic we must plan for attractive accommodations and the finest possible service on our passenger liners. Accordingly, there are under construction by the Federal Shipbuilding & Dry Dock Corporation for the United States Lines, U.S. Maritime Commission P2-S2-R4 twin screw passenger vessels; the Commission's C3-S1-BR1 single screw turbine propulsion passenger and cargo vessels, being constructed by the Ingalls Shipbuilding Corporation for the Mississippi Shipping Company; the "Exceller" type cargo vessels being built by the Bath Iron Works Corporation for the American Export Lines; the Maritime Commission's R2-ST-AV1 vessels being built by the Gulf Shipbuilding Corporation for the United Fruit Company; and the C1-B cargo ships built by the Bethlehem Steel Company.

WENDELL PHILLIPS DODGE.

SHOOTING. The heavy firing of 1945 was confined to theaters of war and our crack marksmen had little time to engage in tournament competition. The only major event held was the traditional Grand American at Vandalia, Ohio, where Don Englebury of Vermilion, Ohio, and Mrs. Van Marker of Evanston, Ill., won handicap honors in their respective groups.

Miss Ruth Knuth, pretty Indianapolis brunette, and Lieut. Vic Reinders of Laredo, Texas, led in the "champion of champions" tests. Other major victors were Rudy Etchen, Memphis; A. F. Jones, Thief River Falls, Minn.; Mrs. Isaac Andrews, Spartanburg, S. C.; Mrs. Lela Hall, East Lynne, Mo., and E. T. Pugh, Morris, Ill.

THOMAS V. HANEY.

SIAM. A constitutional monarchy in southeastern Asia; occupied by Japanese armed forces from December, 1941, until the surrender of Japan in

September 1945. The national name, Siam, was restored by the Government in 1945 in place of Thailand which had been the designation of the country from 1939 to 1945. To the natives the country retains the name, Muang Thai (Land of the Free). Ruler: King Ananda Mahidol (born Sept. 20, 1925), proclaimed King on Mar. 2, 1935, following the abdication of his uncle, Prajadhipok (died May 31, 1941).

Area and Population. Siam's area amounts to 200,148 square miles. The estimated population on Mar. 31, 1940, was 15,718,000. Chief cities: Bangkok (capital) 750,000 inhabitants in prewar times, Chiangmai 544,000, Ayuthia 300,000. Nine-tenths of the people are Siamese. In December, 1941, there were 500,000 Chinese, 500,000 Indians and Malays, 60,000 Cambodians, and some 2,000 Europeans resident in the country.

Education and Religion. There is free and compulsory primary education, but only about 35 per cent of the adult population are literate. As of Mar. 31, 1939, there were 12,809 government, local public, and municipal schools, with a total of 1,567,745 pupils. Bangkok has two state-controlled universities. The religious composition of the population in 1937 was: Buddhists, 13,752,091; Mohammedans, 626,907; Christians, 69,227; others, 15,880.

Production. Over four-fifths of the working population is engaged in agriculture and fishing. The chief crop is rice, which is both the main article of diet and the principal export. Production in 1940-41, 4,923,350 tons of cleaned rice. Other leading crops are tobacco, coconuts, pepper, and cotton. Rubber and tin ore are the most important products after rice. Livestock (1938): 5,711,720 bullocks, 5,551,232 buffaloes, 385,565 horses, and 10,970 elephants. Tungsten, gold, silver, coal, lead, antimony, copper, rubies, and sapphires are produced. Teak lumbering is an important industry. Manufacturing is largely restricted to lumber and rice milling.

Foreign Trade. For the year ended Mar. 31, 1941, merchandise imports were valued at 163,400,000 bahts (128,200,000 in 1939-40); exports, 257,600,000 bahts (208,700,000). Values of the chief 1940-41 exports were (in millions of bahts): rice, 142.8; tin ore, 48.4; rubber, 39.3; teak wood, 5.9. Rice exports totaled 1,625,400 metric tons; rubber, 43,700 metric tons.

Finance. The budget was changed to the Christian calendar year basis beginning Jan. 1, 1941. Ordinary budget estimates for 1942 placed receipts at 210,000,000 bahts and expenditures at 259,000,000; in 1941 they balanced at 138,000,000 bahts. There was a treasury reserve estimated at 31,857,465 bahts on Jan. 1, 1942. Public debt on Sept. 30, 1941, totaled 81 million bahts (internal 26.2 million bahts; external 54.8 million bahts). The baht exchanged at an average of \$0.3515 in 1940.

Transportation. At the time of the Japanese invasion, Siam had about 2,048 miles of railway line, 5,574 miles of highways, and state-controlled airlines linking the principal cities. Air connections with Japan were opened in 1942. During 1939-40 a total of 960 vessels of 1,425,989 tons entered the port of Bangkok.

Government. The constitution of Dec. 10, 1932, transformed Siam from an absolute into a limited monarchy. Nominally the King exercises executive power through a State Council (Cabinet) and legislative power through an Assembly of 182 members, to which the State Council is responsible. Half the members of the Assembly were elected by popular vote and half nominated by the Crown. For developments in 1945, see below.

Events, 1945. The sudden capitulation of Japan precipitated Thailand's most serious national crisis involving the political and economic independence of the country.

Since Thailand, three days following Pearl Harbor, signed a military alliance with the Axis Powers and declared war on Great Britain and the United States, the United Nations, particularly Great Britain, have been inclined to treat Thailand as an enemy state. The Thai official who was responsible for the war declaration was Luang Pibul Songgram, Premier and Minister of Defense, who became Japan's chief quisling in Southeastern Asia. Despite the fact that there was strong opposition to his action, Songgram with Japanese military backing quickly made himself dictator and his country totalitarian.

The United States did not declare war on Siam as did Great Britain shortly following Songgram's action, hence Washington was inclined to take a more conciliatory course toward Thailand than was Great Britain. According to authoritative reports from Thailand at the time, Premier Songgram, who had long been in secret contact with the Japanese, only waited five hours before inviting the Japanese Army, which was already in French Indo-China, to enter Thailand.

U. S. Advised. According to M. E. Denning, chief political adviser to Admiral Lord Louis Mountbatten, who conducted the negotiations (December, 1945) with Thailand's new premier, M. R. Seni Pramoj, (former Siamese Minister in Washington, who replaced Songgram following Japan's capitulation), the United States was not formally participating in the negotiations. However, the U. S. representative at Bangkok, Charles Yost, was being kept informed. Denning said that both Indian and Australian delegates were also participating in the discussion.

In a statement concerning the negotiations at Singapore on Dec. 14, 1945, Mr. Denning recalled that Great Britain and Siam signed on Siam's request, a non-aggression pact in 1940, but despite this Siam only put up token resistance to the Japanese and did not ask Britain for help against the Japanese invaders.

Siam, according to Mr. Denning, decided to "take the easy course" and despite her non-aggression pact, declared war against both Britain and the United States. In addition Thailand accepted as a "gift" from Japan, four states in northern Malaya and two Shan states in Burma and still further territory from French Indo-China. In addition the Siamese puppet government "acquiesced" in Japan's action toward British nationals and their property in Siam. Furthermore, the Siamese puppets raised no objections to Japan's inhuman treatment of some 60,000 Allied war prisoners who were subjected to inhuman treatment while forced to work on a Japanese railway project in the Siam-Burma jungles.

Mr. Denning expressed the opinion that Siam must be held responsible for her actions, despite the fact that the government had since declared the previous war action as "illegal and void" in the latter stages of the war. Mr. Denning regarded the action as a "novel procedure" in international law and if allowed to stand would permit any nation declaring war to escape the consequences when it found itself on the wrong side.

Mr. Denning paid a high tribute to the resistance movement which was organized in Siam by Lieut. Col. Nicol Smith, commander of the U. S. Order of Strategic Services (O.S.S.), but

said that it did not have an opportunity to make a more effective contribution because of the sudden ending of the war. Mr. Denning admitted that the Thai leaders were now "fed up" with the Japanese but he was not entirely convinced regarding their sincerity.

Aside from Mr. Denning's statement, attention was also called to the action of the Thailand Government several months before Pearl Harbor in entering into a secret pact with Japan whereby Japan contracted to construct a modern fleet for Siam, and according to the agreement Japan was to have exclusive charge of naval training and war ship construction for Siam over a long period of years.

Appeal for Moderation. Dr. E. C. Cort, an American physician who spent many years in medical service in Siam, referred in a letter to the New York *Herald-Tribune* to America's long friendly relations with Siam and urged that the United States should take steps to prevent any action by Great Britain which would prejudice the future political and economic independence of the country as a result of the treaty negotiations. Dr. Cort referred to the services rendered to Siam by a long list of American political advisers, including Strobel, Westengard, Sayre, James, Stevens, Dolbeare, Pendleton and others.

According to a dispatch in the New York *Herald-Tribune* by A. T. Steele, its correspondent in the Far East, the following demands on Siam were included in the British proposals for ending the state of war between the United Nations and Siam:

1. Siam is to remain under British rule until accepted into the United Nations.
2. Siamese territory not already controlled by the Allied Military Authority (A.M.A.) must comply with British requests in all matters of civil administration.
3. The British will hold control over all Siamese banks, business, foreign exchange, and commercial and financial transactions until the conclusion of all financial and economic matters arising from the Japanese war.
4. Exports and trade in rice, tin, rubber, and teak will be prohibited until world scarcities of these products end.
5. All rice surpluses will be made available to Britain until the end of the world shortage.
6. All Siamese ports and traffic facilities will be placed at the disposal of the A. M. A.
7. British will censor the press and control radio, telephone, telegraph and all forms of intercommunications.
8. Seized British properties must be turned back and, pending negotiations of a new commerce and navigation treaty, Siam must not enforce measures excluding British commercial, industrial, and professional interests.
9. Siam will be bound to any multilateral treaties made by Great Britain prior to December 7, 1941, whether or not Siam originally was a party to the agreements.

Presented with Bill. The Siamese are being asked to pay expenses of the A. M. A. in Siam—approximately 100,000 baht (\$40,000) a day. The new demands also include 1,500,000 tons of rice. Original demands accepted Siam's gift of approximately one-sixth that amount to the United Nations.

Britain also demanded the right to negotiate a territorial treaty with France on behalf of Siam and demanded that India be given a voice in drawing up the final treaty.

British diplomatic circles in Washington said the U. S. Government was being kept informed regarding the course of the negotiations and nothing would be done to prejudice the political or economical independence of the country or to infringe the "Open Door" for trade between Siam and other countries in the future. Washington reported the United States was particularly concerned regarding Siam's future trade in rice, rubber, tin and hard wood.

Problem of Rice Exports. According to A. T. Steele's report, Great Britain demanded between 1,000,000 and 1,500,000 tons of Siamese rice as an indemnity for property losses suffered by British interests in Siam as a result of the Japanese occupation.

In reply to this and the further charge that Britain demanded control of Siam's foreign commerce, the British stated that their proposals relate only to goods in which there is a world shortage and that in such instances the control would be through an inter-allied mechanism. With reference to other charges the British stated that no part of Siam has been or will be under British or Allied Military Authority (A. M. A.), but that territories previously belonging to British Malaya and Burma which were turned over to Siam by the Japanese, must be returned to the original authorities. The Siamese are resisting this demand on the ground that the territories previously belonged to Siam (particularly portions of French Indo-China) but were seized by the French in 1904. However, the Siamese have aroused little support for their claims as they hailed the acquisition of new territory as part of the victory for their participation in the Japanese "East Asia Co-Prosperity League."

The last diplomatic move in the case of Siam in 1945 was a statement by Dean Acheson, Acting Secretary of State, on Dec. 19 that the United States had "intervened" in the negotiations between Great Britain and Thailand. Acheson requested both sides not to conclude a final agreement until American discussions with Great Britain were concluded. According to the report Dean Acheson expressed special concern regarding alleged efforts of Great Britain to control Siam's exports of surplus rice and to use rice exports as reparations.

The British argued that since Siam is the only "rice surplus" country in Southeastern Asia, that Siam should be compelled to supply rice to other countries as reparations for losses that Siam had caused neighboring states through participation in the war on the side of Japan. The British stuck to their original demand that Siam must give restitution to peoples who had been harmed by Siam's failure to resist Japanese aggression, and the role she had played as a Japanese "puppet." Since the State Department was unable to induce the British to forego their demand for "restitution," Dean Acheson said he was trying to scale down the quantity of rice to an amount "not exceeding 800,000 tons." The British stated they would be willing to "cushion" the deal by advancing a loan to the Siamese Government. The Siamese Prime Minister Mom Rajawong Seni Pramoj, was quoted in a dispatch from Bombay on December 19 as stating that he was prepared to sign the agreement "shortly."

Anglo-Siam Treaty Signed. It was announced on January 1, 1946, that an Anglo-Siamese agreement, officially ending the state of war with Thailand, had been signed by representatives of the United Kingdom, the Government of India and the Kingdom of Siam. A further agreement between Siam and Australia was scheduled for signature shortly.

Under the treaty Siam pledged herself to participate in regional security arrangements in Southeastern Asia and the Southwest Pacific under the United Nations Charter. The treaty was signed on behalf of Siam by Prince Viwat Anajai Jayiyant and Prince Viwatchai Chaiyang, and on behalf of Great Britain by M. E. Denning, political adviser to Admiral Lord Louis Mountbatten, by M. E. Aney for India.

Under Article I Siam agrees to return to Great Britain all territories seized after Dec. 7, 1941, and to rescind all legislative acts concerned with their annexation. Also to make compensation for all losses occasioned British subjects by the annexations.

Under Article III Siam assumes responsibility for safeguarding, maintaining and restoring unimpaired all British property throughout Siam. British business concerns and banks are permitted to resume operations. Siam agrees to pay arrears of interest on all loans since the date of default, to restore import and export trade with neighboring British territories, and to negotiate new commercial treaties.

Kra Canal Prohibited. Article VII gives definite assurance that Siam will not construct any canal across the Isthmus of Kra, linking the Gulf of Siam with the Indian Ocean, "without the prior consent of the United Kingdom." The Japanese had long planned to build the canal in order to shorten the distance to India by some 1,500 miles.

Siam agrees to restore the validity of all treaties which were abrogated by her declaration of war against the Allies on Jan. 25, 1942.

Siam agrees to participate in any general international agreement regarding tin and rubber which may be decided by the United Nations or its Economic and Security Council.

Siam promises to make available to Great Britain 1,500,000 tons of surplus rice for export to adjacent rice-consuming countries. The amount of rice exported is to be adjusted in accordance with the excess above domestic requirements.

Siam agrees to restore all prewar agreements concerning navigation and air services.

Prior to a date not later than Sept. 1, 1947, Siam undertakes not to export rice, tin, rubber and tea except in accordance with the recommendations of the appropriate boards of control of the United Nations Organization.

Great Britain and India agree to sponsor Siam's application for membership in the United Nations.

The United States had originally raised objection to the treaty on the ground it was "too severe," and would infringe on Siam's independence, but the objection was later withdrawn. Since the United States did not declare war on Siam, it repeatedly interceded on its behalf during the war, and maintained a counter-espionage organization against Japan within the country. It was reported that the United States would shortly extend recognition to the new Siamese Government of Prince Seni Pramoj.

JOHN B. POWELL.

SILVER. With mine production slackening, the story of silver was wound up in government actions which profoundly affected commerce and consumption of the metal. War Production Board on May 26 removed restrictions on the use of domestic silver through amendment of its order M-199, and on Aug. 20 revoked the order, thereby ending all use and distribution controls. With booming demand

from manufacturers, and import restrictions over, the Office of Price Administration raised the ceiling price of foreign silver from 45 cents per fine troy oz. to 71.111 cents, bringing it to parity with the domestic silver price.

These actions precipitated renewed controversy between (1) legislative representatives of the silver producing States, who would like to see the Treasury buy silver at its full monetary value (\$1.29 an oz.), and (2) those espousing the cause of industrial users who wish to keep the price at the 71.111 cent level. In the tussle the Green Act, which, as renewed since July 12, 1943, has provided that surplus Treasury silver could be released for war purposes and civilian production at the lower price, was allowed to expire Dec. 31.

Compared with more than 1,200 million oz. of surplus "free" silver (not backing currency in circulation) when the act first went into effect, the treasury in Dec., 1945, held only 403 million oz. Monetization of 158 million oz. of this remainder has been authorized. The treasury sold 139,000,000 oz. of "free" silver for industrial use through Nov. 30, compared to 46,200,000 oz. in all of 1944, and 20,800,000 oz. in 1943 after the Green Act became effective.

Consumption of silver in the United States for non-monetary purposes reached an estimated 150,000,000 oz. (1944: 125,000,000 oz.), reflecting a demand which brought the market price of foreign silver immediately to the new ceiling in September. Because silver is mined principally in conjunction with the base metals and gold, whose production dropped, only 28,847,812 oz. came from domestic mines. Output of other Western Hemisphere countries also dropped, Mexico producing 60,000,000 oz. (1944: 63,000,000 oz.); Peru, 11,500,000 (1944: 11,700,000); and Canada, 14,000,000 (1944: 14,700,000).

C. T. Post.

SKATING. When the season ended last year, this hemisphere's most glittering figure-skating crown rested on the pretty head of 16-year-old Barbara Ann Scott, who, after successfully defending her Canadian senior women's title, visited New York and captured the North American laurels at Madison Square Garden.

Combining the North American and national championships for the first time, officials produced a gala event on the Garden ice. Miss Gretchen Merrill, blonde miss from Boston, carried off U. S. senior honors for the fifth time in eight years of competition, but had to be content with second place behind Ottawa's Miss Scott in the North American finals.

National junior laurels went to Miss Eileen Seigh, 16, a rising star from Brooklyn. Other U. S. title winners included J. P. Brunet and Miss Donna Pospisil, New York, senior pairs; Robert Swenning and Mrs. K. M. Williams, New York, senior dance, and Lieut. Comdr. Lyman Wakefield and Miss Betty Higgins, Boston, junior pairs. The men's individual events were canceled because of the war.

Many former champions and newcomers joined casts of the popular professional shows and the Ice Follies, Hollywood Revue and Ice Capades continued to draw packed houses in their cross-country tours.

Honors in speed skating were quite divided, travel restrictions preventing any big meets that might have brought together the top stars. Herman Van Putten of Paterson, N. J., and Miss Marion Hanley of Staten Island shone in races along the eastern seaboard, Van Putten's major triumphs

coming in the Middle Atlantic and New York State championships. Listed among Miss Hanley's many titles were two captured in the same meets. U. S. men won most of the laurels in the Manitoba title tests at Winnipeg, Don Johnson of Minneapolis taking the senior division crown.

Two national marks of long standing fell at Minneapolis in January. Bobby Fitzgerald streaked through the senior men's 880 in 1:14.2 to clip a full second off the record set by Clas Thunberg of Finland at Lake Placid in 1926 and Miss Betty Fahlin skated the women's 440 in 0:41.7 to better the standard of 42 seconds set by Miss Betty Knapp at Lake Placid in 1940.

THOMAS V. HANEY.

SKIING. Travel restrictions and the absence of many top-flight skiers serving with the armed forces held this sport in check last season. Competition was more or less localized.

Few championships were held and probably the most important of the year was the annual Alta Cup meet at Salt Lake City, where Pfc. Barney McLean captured the slalom and meet titles and Miss Barbara Kidder, Denver coed, led the women's field. Charles Blum of New York annexed the downhill test for his second big triumph of the season, the 22-year-old ace having scored before 8,000 in an invitation race at Bear Mountain earlier in the campaign.

Consistent scorers in college and invitation meets included Dick Gaylord, whose Middlebury team was outstanding in intercollegiate competition; Joe Jones, Middlebury; Francis Drury, Dartmouth; Howie Hewitt, Dartmouth; Vernon Lamb, Dartmouth; Merrill Barber, Brattleboro Outing Club; Elliott Lang, Andover, Me., and Larry Ambrose, Vermont.

Miss Margaret Burden of Westmount, P.Q., captured the downhill contest in the women's international races at Pico Peak and placed fourth to Miss Ann Volkmann of Concord, Mass., who won the slalom. Miss Rhona Wurtele of Montreal, who set a new downhill course record at Montreal; Miss Rebecca Fraser, Middlebury, and Miss Barbara Shaw, Stowe, Vt., were other stars in women's events during the season.

THOMAS V. HANEY.

SLOAN FOUNDATION, The Alfred P. Incorporated in 1936, the Foundation aids accredited schools and colleges in developing new "patterns" in economic education. On Dec. 31, 1944, its capital assets were valued at \$6,879,339.29. Up to the same date, the Foundation had made grants and donations amounting to \$6,472,490.99. At present the Foundation is enabling colleges and universities to promote popular economic education through radio, recordings, motion pictures, books and pamphlets, fellowships, and class instruction. Among such projects aided by the Foundation are: the *University of Chicago Round Table of the Air*, a weekly radio discussion of economic phases of national and international questions; the New York University Film Library, which distributes sound motion pictures and recordings; and the Public Affairs pamphlets, containing popular digests of current economic researches, issued continuously by the Public Affairs Committee of New York.

In addition the Foundation is currently providing support for seminars on current economic problems at New York University and at the American University. Members of these seminars include graduate students and community leaders. The Foundation also lends its support to the Department of

Government Management at the University of Denver.

In the field of applied economics, the Foundation aids the State universities of Kentucky, Florida, and Vermont in carrying on experiments designed to help low-income groups. The experiments aim to discover whether solely through instructing school children in simple, inexpensive ways of improving diet, housing, and clothing, the community level of living can be raised. To enable teacher-training institutions throughout the country to study these experimental centers at first-hand, special grants were made to the American Association of Teachers Colleges for traveling fellowships.

SMALLER WAR PLANTS CORPORATION. An emergency war agency of the U.S. Government, which reports through the War Production Board; created by act of Congress on June 11, 1942, with a capital stock of \$150,000,000, for the most effective utilization of small business concerns in the war effort. Management is vested in a board of five directors appointed by the chairman of the WPB. The Corporation assists in the procurement of prime contracts and subcontracts, leases machinery, lends money, aids in the disposal of surplus materials and equipment to small business, and assists in the solution of technical and financial problems. The Corporation also participates with other agencies in facilitating the prompt and equitable settlement of the claims of small prime and subcontractors arising from the termination of war contracts. Chairman of the Board of Directors: Maury Maverick.

SMITHSONIAN INSTITUTION. The affairs of the Institution are administered by a Board of Regents consisting of the Chief Justice of the United States, the Vice President, three members of the Senate, three members of the House of Representatives, and six citizens other than members of Congress. The executive officer directly in charge of the Institution's activities is the Secretary. Dr. Alexander Wetmore is the present Secretary.

Research and explorations, which normally form the major part of the Institution's program for the "increase of knowledge," have been curtailed, owing to wartime conditions. The new field expeditions that were carried on were concerned in the main with matters connected with the conduct of the war or with commitments dating back to the prewar period, or with the improving of cultural relations with the other American republics. The staff continued to devote a considerable part of its time until the end of the war to furnishing technical information to the Army, Navy, and war agencies. Many of the requests called for extended research, reports, or conferences. The Institute of Social Anthropology, an autonomous unit of the Bureau of American Ethnology, created within the Institution to carry out cooperative work in anthropology with the other American republics, continued its program of teaching and research in Mexico and Peru. Several members of the Smithsonian staff conducted field expeditions in South and Central American countries in cooperation with scientists of those countries. Preparation of the monumental Handbook of South American Indians continued; four volumes are now in press and the fifth is nearing completion.

The "diffusion of knowledge" is carried on by publication of the results of scientific research and exploration. The publications of the Institution proper and the bureaus under its administrative direction appear in 13 distinct series as follows: *Smithsonian Institution*, Annual Report (with gen-

eral appendix made up of selected articles reviewing the year's advances in science), *Contributions to Knowledge* (suspended), *Miscellaneous Collections*, and special publications; *National Museum*, Annual Report, Bulletin, Proceedings, and Contributions from the National Herbarium; *Bureau of American Ethnology*, Annual Report and Bulletin; *Astrophysical Observatory*, Annals; *National Collection of Fine Arts*, Catalog; and *Freer Gallery of Art*, Oriental Studies. Copies of all publications in these various series are distributed free to a large list of libraries, learned societies, and specialists throughout the world, and certain of the less technical publications, such as the Smithsonian Reports, are widely distributed among the general public. During the year 56 publications were issued, and the total number of publications distributed was 141,635. Outstanding among the year's publications may be mentioned *Weather Predetermined by Solar Variation*, by C. G. Abbot; *Review of the Spider Monkeys*, by Remington Kellogg and E. A. Goldman; *Checklist of the Coleopterous Insects of Mexico, Central America, the West Indies, and South America*, part 3, compiled by Richard E. Blackwelder; and *The Contemporary Culture of the Cáhita Indians*, by Ralph L. Beals. There were also reprinted the first two volumes of *World Weather Records*, assembled and arranged by H. Helm Clayton, the first volume containing records up to 1920, and the second, records for the period from 1920 to 1930.

The Smithsonian library, made up of 10 divisional libraries and 35 sectional libraries, now contains 918,460 volumes, pamphlets, and charts. Accessions during the year numbered 4,844 volumes, pamphlets, and charts.

ALEXANDER WETMORE.

SOCIAL DEMOCRATIC FEDERATION, U.S.A. National Chairman is Algernon Lee, New York, N.Y.; national vice-chairmen, Louis P. Goldberg, New York, N.Y., and Dr. William J. Van Essen, Pittsburgh, Pa.; secretary, August Claessens, New York, N.Y. Headquarters: 7 East 15th St., New York, N.Y.

SOCIALIST LABOR PARTY. National Secretary is Arnold Petersen; national treasurer, Paul Herzog. Headquarters: 61 Cliff St., New York, N.Y.

SOCIALIST PARTY. Socialist activity in the United States concentrated on promoting national legislation and backing reforms. It strove for the development of a mass party of labor, farmers and co-operators. The Party backed the Full Production Authority Act and supported fair employment practices, anti-lynching and anti-poll tax legislation. It opposed peacetime military conscription and urged the opening of America's doors to refugees.

Prof. Maynard C. Kreuger, Chicago, Ill., is National Chairman; Harry Fleischman, New York, N.Y., is National Secretary; and William Becker, New York, N.Y., is National Labor Secretary.

SOCIAL SECURITY BOARD (SSB). Events in 1945 continued to emphasize the importance of existing social security provisions in the United States. With the collapse of Germany, changes in the character, tempo, and geographic concentration of war production were reflected in layoffs and cut-backs in employment. While labor shortages were still acute in most places and laid-off workers, in general, were quickly reemployed, an increasing number of persons had to claim their rights to social insurance. After the long wartime decline, assistance programs

also recorded an upturn in applicants. The capitulation of Japan broadened the extent to which the social security program was called on to provide the substitute for earnings necessary when old age, lack of skills and experience, or other handicaps to self-support forced some people out of the jobs they had been able to hold in the war emergency or when other changes reduced or stopped the earnings and military allowances from which workers and servicemen had helped support dependent relatives.

Because of the insurance and assistance programs established by the Social Security Act a decade ago, the country was far better able to face the abrupt transition to peace than it was at the close of World War I. Some 1,350,000 workers aged 65 and over had acquired, as of Jan. 1, 1946, the fully insured status which would make them eligible for retirement annuities under the Federal old-age and survivors insurance system, and the face value of current survivor insurance under that program exceeded \$50,000,000,000. About 36,000,000 workers had sufficient 1944 wage credits under State unemployment insurance laws to make them eligible for unemployment benefits if they lost their job and could not immediately get another. All States and Territories were using Federal grants-in-aid toward assistance payments to needy persons aged 65 and over; by September 1945 all but Nevada were similarly using Federal funds to make payments to needy dependent children deprived of parental support or care, and by the close of 1945 all but Alaska, Missouri, Nevada, and Pennsylvania were providing aid to the needy blind with Federal financial participation.

A decade of experience in administering the two insurance and three assistance programs under the act has focused attention on the groups of persons and risks for which similar protection is lacking. The 1944 platforms of both major political parties, pronouncements of international and national labor organizations and employer associations, and resolutions of welfare organizations and other civic groups have almost unanimously urged extension of the coverage of old-age and survivors insurance and unemployment insurance to types of work now excluded, provision of similar protection against the risks of wage loss from sickness or disability, and Federal grants to States for programs for assistance to needy persons who fail to qualify for aid under the special types of assistance, for which alone such grants are now authorized under the Social Security Act. Further, the President, the Social Security Board, and many other public and private organizations have urged that tested social insurance and assistance principles be applied in nation-wide programs to meet the costs of medical care.

Opportunity for employment is the basic defense against want, but other sources of livelihood must be provided for children who lack parental support and for their mothers or other relatives who give them full-time care; for persons whose advanced age or other handicap precludes earning; and for families in which the breadwinner is sick or disabled or is unable to get suitable work. Moreover, the lack in some localities of adequate medical facilities and the barrier of costs are major causes of the substandard health of the many boys and men who could not meet Selective Service requirements and of a large share of the loss of production and income when workers cannot be at their jobs because of sickness. The Board's recommendations for extending social security appear in its annual reports to Congress; progress in the decade 1935-45

is appraised in the August 1945 issue of the *Social Security Bulletin*; special analyses and periodic data appear in monthly issues of the *Bulletin* and in its calendar-year supplement, the *Social Security Yearbook*.

Old-Age and Survivors Insurance. In an average week of 1944 approximately three-fifths of the persons in the civilian labor force were in industrial and commercial jobs that carry wage credits toward benefits under this program. Of some 73,000,000 living workers who, by Jan. 1, 1946, had been in such jobs, more than half were fully or currently insured. Fully insured status is acquired as of a given time by workers who have had wage credits of \$50 or more in at least 6 calendar quarters and in at least half the number of quarters elapsed since 1936 or attainment of age 21, if later, and the quarter in which the worker reaches age 65 or dies. Certain survivor benefits are payable for deceased workers who were only currently insured, that is, who have had wage credits of \$50 or more in at least 6 of the 12 quarters immediately preceding death.

As of the beginning of 1946, about 33,000,000 workers were fully insured, 8,500,000 were currently insured only, and 31,500,000 who had been in covered jobs at some time since the beginning of the system were uninsured. Some of these last had lost their previous insured status because of transfer to military service or other noncovered employment or temporary or permanent withdrawal from the labor force. Others had only recently entered covered employment. Still others had had only intermittent jobs in covered employment, such as holiday work in stores or seasonal work in canneries, and may or may not eventually meet the conditions for insured status. Many of the uninsured women will later qualify for wife's or widow's benefits on the basis of their husbands' wage records.

At the end of September, some 556,000 fully insured workers were on the retirement benefit rolls, among them more than 164,000 men whose aged wives were also entitled to benefits based on the husband's wage record. The average combined benefit in force on Sept. 30, 1945, was \$38.10 for a retired worker and his wife; the benefits of retired men without entitled wives or children averaged \$24.30 a month, and the average for retired women was \$19.40. The average monthly survivor benefit in force for a family at the end of September was \$50.40 for a widow with 3 or more child beneficiaries in her care; \$20.20 for an aged widow alone, \$13.20 for the parent of a deceased fully insured worker, and \$12.40 for a single child beneficiary.

Payments under the program in September totaled \$24,368,000, including both retirement and survivors' monthly benefits and the \$1,697,000 in lump-sum payments made at the death of an insured worker who left no survivor immediately eligible for monthly benefits.

Because the majority of persons eligible have apparently preferred to keep or get jobs in covered employment while they could, the beneficiary rolls mounted less sharply during the war than would otherwise have been expected. Increases in the number of insured workers and declines in work opportunities were apparent, however, in the first 9 months of 1945, when monthly benefit awards exceeded the total for 1944. At the end of June, nearly 170,000 persons were foregoing their monthly benefits because they, or the beneficiary or whose wage record their benefit rights were based, were in covered employment, and in addi-

tion, some 750,000 insured workers had failed to claim benefits for which they were eligible, presumably also because they preferred to hold covered jobs.

Congress has successively postponed the originally scheduled increase in the contribution rate, most recently for the calendar year 1946. Covered workers and their employers—each contributing 1 percent of wages up to and including \$3,000 a year—paid \$986,000,000 in the first 9 months of 1945 toward financing old-age and survivors insurance. Monthly benefits and lump-sum payments certified in the period amounted to \$207,000,000. The assets of the old-age and survivors insurance trust fund, to which contributions are appropriated and from which benefits and administrative expenses are paid, aggregated nearly \$7,000,000,000 on Sept. 30, 1945.

Federal-State Unemployment Insurance. An estimated 6,000,000–7,000,000 jobs were wiped out in the 10 weeks following the capitulation of Japan. In September about 610,000 workers received an aggregate of \$50,410,000 in unemployment payments under the laws of the 51 States and Territories, compensating for a total of nearly 2,700,000 man-weeks of unemployment. Others who had filed claims found jobs before they drew benefits, and other workers who had been laid off withdrew from the labor force temporarily, for a rest, or to continue schooling or attend to household duties. Large-scale unemployment materialized in only a few areas in the autumn; most displaced workers were quickly reemployed. Most of those who drew benefits were women or handicapped persons, while most of the jobs offered were for men who could do heavy manual work.

Many States amended their unemployment insurance laws, but extreme differences remain in the protection afforded by the various State laws. The average weekly payment for total unemployment was \$18.44 in July-September and was made up of widely varying amounts, representing the range from the minimums of \$3 a week or less payable in some States to the maximums of \$28, including allowances to dependents, in others. Under the State laws, the weekly amount, and in many States also the potential duration of payments to an unemployed worker, depend on his prior earnings in covered employment.

In 1944, an estimated 44,000,000 different workers received wage credits under State unemployment insurance laws, a slight decline from 1943. Because several States limit the coverage of their programs to workers in industrial and commercial firms employing 2, 3, 4, or 8 or more workers, the estimated number of workers acquiring wage credits toward unemployment insurance in an average week of 1944 was 29,000,000, about 1,400,000 less than the number acquiring credits toward old-age and survivors insurance.

States paid out about \$127,000,000 in the first 9 months of 1945, and at the end of that period had nearly \$7,000,000,000 in funds available for benefits. Workers contribute toward the system in only four States; in others, employers pay specified percentages of wages, up to and including the first \$3,000 a year. In 45 States the rates of employer contributions vary with the individual firm's experience with unemployment. These "experience-rating" provisions are diverse in character and result in large differences in the contributions paid by employers in similar circumstances. Amounts collected in the first 9 months of 1945, including the additional "war-risk" contributions levied in 12 States, aggregated \$925,000,000, \$73,000,000

less than in the comparable period of 1944. These contributions are deposited in the unemployment trust fund to the credit of individual States; interest on the State's share of the invested portion of the fund is credited periodically, and States withdraw from their accounts amounts needed for benefit payments.

Public Assistance. During the war years public assistance rolls included relatively few people who could work, even under wartime standards of employability. Declines in these rolls have demonstrated that employability varies with labor-market conditions and that people with any capacity to work prefer self-support to dependency. In 1944, the payments for public aid totaled about \$944,000,000 or one-third the amount in 1940, when, in addition to the expenditures for public assistance, large sums were spent for earnings of persons employed on Federal work projects and small sums for food stamps under programs which terminated in 1943. In 1944 old-age assistance accounted for about three-fourths of all public aid, as contrasted with two-thirds in 1943 and less than one-fifth in 1940. Aid to dependent children was 14 percent of the 1944 total; to the blind 3 percent, and general assistance, 9 percent.

By September, recipient rolls, which had dropped almost steadily during the war emergency, had begun to rise again and the increases were appreciable in some States. General assistance—which is financed by States and localities alone—was particularly responsive to economic changes. The number of requests for this form of aid increased steadily after April in 19 large cities; the chief reason was loss of a job or decrease in earnings. With declines in job opportunities and earnings and in servicemen's allowances, many people who have been living on marginal earnings or on support provided by relatives become dependent on public aid.

Wartime declines in assistance rolls have permitted States to increase assistance payments somewhat in recognition of the rise in living costs. Assistance levels, however, vary greatly and even in war years were inadequate in some areas and for certain groups, especially for recipients of general assistance, for which no Federal funds are provided. In September, the average payment for old-age assistance was \$30.17 for the United States as a whole but ranged from \$11.56 in Kentucky to \$49.83 in the State of Washington; for the blind the range was from \$13.01 to \$53.89, with the same two States in the low and high positions and a national average of \$31.12 for the 46 States sharing in Federal grants-in-aid; the average per family in aid to dependent children was \$48.94 for the 50 States receiving Federal funds for that program, while the extremes, for Texas and Washington, were \$20.83 and \$92.62, respectively. The national average for general assistance was \$29.72 per case, with a range from \$8.42 in Mississippi to \$49.71 in Washington.

The objective of the individual assistance payment is to supply the difference between any income or other resources the needy person himself has and the amount the State agency finds necessary to meet his requirements. Lack of funds, however, has made it necessary for some States to limit the amount payable to any person or family, however great the need; other States have had to disregard such requirements as medical care in determining the amount of the assistance payment; still others have applied a uniform limit to the proportion of the recipient's needs which the assistance payment can meet—allowing the recipient perhaps

only two-thirds or three-fourths of the amount which the State agency finds he needs.

Since the Federal funds granted for State public assistance programs under the Social Security Act depend on the amounts which each State puts up for Federal matching, proportionately more Federal aid goes to the wealthier States than to States where resources are least and need is greatest. The 10 States at the top of the list in per capita income payments in 1944 had 36 percent of the population of the country and received 40 percent of the total amount for public assistance from February 1936 through December 1944; the 10 States with the lowest per capita income in 1944 had 18 percent of the population and received only 8 percent of these Federal funds. Limits to Federal matching—half the State payment to the recipient, but not

more than \$20 a month in Federal funds for an aged or blind person and not more than \$9 a month for one child receiving aid to dependent children and \$6 for each additional child aided in the same family—are also important factors in State inability to meet all the requirements of recipients.

The total amount of public assistance payments in 1944, including programs financed without Federal aid, represented about \$22 per inhabitant in Colorado and less than \$5 per inhabitant in 15 States. Assistance payments in the year for the three special types of public assistance and for general assistance totalled \$944,000,000, of which Federal grants for old-age assistance, aid to dependent children, and aid to the blind under the Social Security Act represented about two-fifths.

ARTHUR J. ALTMAYER.

* State distribution estimated. Data for beneficiaries residing in foreign countries are allocated to State in which claim was filed. * Partial, part-total, and total unemployment. * Excludes California and Michigan; data not reported for September. * Not computed. Average payment not calculated on base of less than 50 families. * No plan in operation under the Social Security Act.

SOCIETIES AND ASSOCIATIONS. The following is a list of some of the leading national and international organizations, with a concise report of their activities during 1945. The organizations are listed alphabetically according to the first specific word in each title. Certain classifications have been omitted in this list because they are presented elsewhere in this volume. The reader is, therefore, referred to the following articles as a supplement: for accrediting associations, to the article on **UNIVERSITIES AND COLLEGES**; for labor organizations, to **LABOR CONDITIONS**; for religious bodies, in addition to the interdenominational groups listed below, to the separate articles on **Churches** and the table on **RELIGIOUS ORGANIZATIONS**; for sport organizations, to articles on various sports and **Amateur Athletic Union**, below. For foundations and trusts, government agencies, learned academies, and institutes, see separate articles. For official international organizations, see **PAN AMERICAN ACTIVITIES** and **UNITED NATIONS**, as well as various separate articles.

Actors' Fund of America, founded in 1882 to care for the impoverished, aged, and infirm members of the theatrical profession. Membership (1944). 2,604. President: Walter Vincent. Secretary: Robert Campbell. Headquarters: 1619 Broadway, New York City. The Fund, supported by donations, benefit performances, and a limited endowment, spends from \$140,000 to \$180,000 a year. A home for retired actors is maintained in Englewood, N. J.

Adult Education, American Association for, founded in 1926 to serve as a clearinghouse for information, initiate activities, and assist enterprises already in operation, and to aid and advise individuals who, although occupied with some vocation or interest, desire to continue their education. Membership. 2,850. President: Lyman Bryson. Director: Morse A. Cartwright. Headquarters. 525 West 120 Street, New York City.

Advancement of Colored People, National Association for the, founded in 1909 to combat the spirit of unfairness which confronted colored people in the United States, safeguard their rights, and secure for them equal opportunity with all other citizens. Membership. 600,000. President: Arthur B. Spingarn. Executive Secretary: Walter White. Headquarters: 20 West 40th St., New York 17, N. Y. The Spingarn medal, an award to "prominent pioneers of a people fighting for its rights on the frontier of intolerance and bigotry," was awarded in 1944 to Mr. Paul Robeson, characterized as a "man who exemplifies the finest in America and American Negro tradition of sportsmanship and contribution to public welfare."

Advancement of Music, National Bureau for the, founded in 1916 to promote musical interest and activities and to aid those interested in such activities. Membership: Anyone contributing \$5 or more. President: Howard Braucher. Bureau Director: C. M. Tremaine. Headquarters: 315 Fourth Avenue, New York City 10. The Bureau cooperates with existing agencies in the field of music and promotes National Music Week (beginning first Sunday in May), now expanded to National and Inter-American Music Week. Has available comprehensive list of publications on many aspects of music including school music, contests and festivals, community music, group instruction and applied music. Merged with the National Recreation Association January, 1943.

Advancement of Science, American Association for the, founded in 1848, a democratic and representative organization devoted to the whole field of science. Organized in 15 sections, it has over 27,000 members and 190 associated societies. President: Dr. Charles F. Ketterling. Permanent Secretary: Dr. F. R. Moulton. Headquarters: Smithsonian Institution Building, Washington, D. C. Publications: *A.A.A.S. Bulletin*, *Science*, *The Scientific Monthly*, technical symposia and nontechnical scientific books. A meeting was held in Cleveland, Ohio, September 11-16, 1944. A general meeting will be held in St. Louis, Mo., March 27-30, 1946.

Advancement of Science, British Association for the, founded in York, England, in 1831. President: Sir Richard Gregory. Secretary: O. J. R. Howarth. Headquarters: Burlington House, London, W. 1. The Association holds an annual meeting at which papers are read (subsequently published) and sets aside an annual sum for scientific researches. In lieu of the Annual Meetings, in wartime the Association has held Conferences, arranged by its Division for the Social and International Relations of Science.

Aeronautic Association, National (NAA), founded in 1922, a nonprofit, nonpartisan organization representing the consumer interest in all phases of aviation. Net paid

membership: 20,000, with 100 chapters throughout the United States. President: William R. Enyart. Manager: Lowell H. Swenson. Headquarters: 1025 Connecticut Avenue, N.W., Washington 6, D.C. Outstanding functions, 1945: promotion of airports and airway facilities; encouragement of private flying; sponsorship of the Joint Aviation Users Conference and the National Aviation Clinic; aviation for public education; model building and flying for youth; development of progressive legislation; fostering of American air supremacy; representing the Federation Aeronautique Internationale in the U.S.; supervision of aircraft records and performances; awarding of the Robert J. Collier Trophy; U.S. Wing of the Robert J. Collier Trophy; U.S. Wing of the Inter-American Escadrille; publisher of *National Aeronautics*, *Model Aeronautics*, *Airport Digest*, *FYI* and *Boletín de Aviación*; guidance activity for veterans.

Aeronautical Sciences, Institute of the, founded October 15, 1932, to advance the sciences applied to aeronautics through the publication of technical papers, the holding of scientific meetings, and other activities contributing to the progress of the aeronautical profession. President: Arthur E. Raymond. Secretary: Robert R. Dexter. Headquarters: 2 East 64th Street, New York City. Annual Meeting of the Institute is scheduled to take place at Columbia University, New York City, January 29, 30 and 31, 1946.

Allied Youth, Inc. has acquired its own national headquarters, The Allied Youth Building, 1709 M Street, N.W. Washington, D.C. during 1945. Allied Youth is a non-sectarian, non-political movement supporting the platform "We stand for the liberation through education of the individual and society from the handicaps of beverage alcohol." The movement functions primarily in the high schools of the nation, its speakers addressing high school student assemblies and organizing Allied Youth Posts to study the alcohol problem and promote an alcohol-free social and recreational program. The National Board of Trustees of Allied Youth includes well-known educators, civic and religious leaders. Outstanding athletes and coaches have membership on the National Advisory Committee. Allied Youth is not concerned with legislation but with helping youth at the point of personal choice, aiding it to get the scientific facts concerning alcohol. Publications include *The Allied Youth*, monthly except August, the *Alcoholfax Educational Service*, and programs and other material for schools and churches. Complete information may be received by addressing W. Roy Breg, Executive Secretary, Allied Youth Inc., 1709 M Street, N.W. Washington 6, D.C.

Amateur Athletic Union of the United States (A.A.U.), founded in 1888 to improve and promote amateur sports and the civic interest of the nation, by the education of all classes in the benefits to be derived by participation in athletics. The A.A.U. establishes a uniform test of amateur standing and uniform rules governing the sports within its jurisdiction, regulates and awards the athletic championship of the United States, and promotes legislation in the interest of sports facilities. President: Willard N. Greim. Secretary: D. J. Ferris. Headquarters: 233 Broadway, New York City 7. For activities and awards during 1945, see the separate articles on the various sports.

American Legion, The. See separate article, **AMERICAN LEGION**.

Antiquarian Society, American, founded in 1812 with the maintenance of a national library of American history as its chief purpose. The library contains nearly 700,000 titles and is free for the use of all qualified scholars. Membership (honorary). 200. President: Samuel Eliot Morison. Director: O. S. Brigham. Librarian: C. K. Shipton. Headquarters: Worcester, Mass.

The Anti-Saloon League of America, founded in 1895 to promote temperance education and legislation. During 1945 the League concentrated its efforts upon temperance education in the States and upon the increase in the number of political units voting no-license under local option laws. In the area of Federal action it urged the broad use of the war powers conferred upon the President by the several War Powers Acts to prevent the waste of materials and manpower during World War II. President: Bishop Ralph S. Cushman; General Superintendent: George W. Crabbe. Headquarters: 131 B St. S.E., Washington 3, D.C.

Archaeological Institute of America, founded in 1879 to promote and direct archaeological investigation and research. Membership: 1,200. President: William Bell Dinsmoor. General Secretary: Meriwether Stuart. Headquarters: 504 Schermerhorn Hall, Columbia University, New York City.

Architects, The American Institute of, founded in 1857 to promote the efficiency of the profession, to advance education in architecture and allied subjects, and to make the profession of increasing service to society. Membership: 5,500. President: James R. Edmunds, Jr. Secretary: Alexander C. Robinson III. Treasurer: Charles F. Cellarius. Executive Secretary: Edward C. Kemper.

Artists Professional League, Inc., American, founded in 1928 to arouse for American art the regard, preference, and support of the American people; to spread de-

pendable technical knowledge among artists; to urge the adoption of a *Fair Jury System* in competitive exhibitions of contemporary visual arts; to be of use in the *Rehabilitation Program* in military and naval hospitals throughout the country; to contribute counsel and ideas throughout the United States on the selection of *War Memorials* that will be of enduring worth and significance and so win wide regard for the community erecting such memorials; and to obtain legislation that will benefit the artist's profession and terminate piracy of designs. In 1945 was published in New York, the late R. W. Gardner's *A Primer of Proportion in the Arts of Form and Music*, sponsored in 1944 by The American Artists Professional League. Since 1933 the League has sponsored the annual nation-wide celebration of American Art Week, November 1-7. In 1945 the governors of 50 states and the mayors of hundreds of cities and towns issued proclamations favoring celebrations of American Art Week sponsored by The American Artists Professional League. Membership: about 2,000 throughout the United States and its territories. National President, F. Ballard Williams. National Secretary Wilford S. Conrow. Headquarters: Carnegie Hall, New York City. At the Annual Dinner, February 24, 1945, the following honors were awarded for excellence in celebrations of American Art Week:

1st, to the Tennessee State Chapter, etching, *Cavendish Common*, by John Taylor Arms; 2nd, to the North Carolina State Chapter, etching *R.F.D.*, by Martin Lewis; 3rd (a) to the Texas State Chapter, etching *Raleigh Tavern*, by Samuel Chamberlain; (b) to the New Jersey State Chapter, etching *Boothbay Harbor*, by James E. Allen; (c) to the Massachusetts State Chapter, reproductive wood engraving by Timothy Cole, after detail of the *Washington*, "Where There Is No Vision The People Perish," painted by Wilford S. Conrow. Honorable Mentions were given to the State Chapters of California, Indiana, Connecticut, Maine and Georgia, and Special Commendations to Puerto Rico, Ohio, Louisiana, Washington, D. C., Michigan, Wyoming and Colorado.

Arts and Letters, National Institute of, founded in 1898 to further the interests of literature and the fine arts. Membership 250. President Arthur Train. Secretary: Henry S. Canby. Headquarters: 633 West 155 Street, New York City. A Gold Medal was awarded in 1945 to Paul Mansford for Sculpture and "The Institute Award for Distinguished Achievement given to an eminent foreign artist, composer or writer living in America" was presented to Richard Beer-Hofmann (who died Sept. 26). Scheduled meetings: Public Ceremonial and Exhibition given jointly with the American Academy of Arts and Letters (founded by 50 members of the National Institute—see ARTS AND LETTERS, ACADEMY OF) in May, 1945, at New York City; Annual Dinner-Meeting, Dec. 19, 1945, in New York City.

Arts and Sciences, American Academy of, founded in 1780 to encourage scientific work and publication. Membership: 800 Fellows and 130 Foreign Honorary Members. President Howard Mumford Jones. Corresponding Secretary: Abbott Payson Usher. Headquarters: 28 Newbury Street, Boston, Mass. During 1944 a number of grants for research work were made from funds given the Academy for that purpose. Meetings are held monthly, October through May.

Arts, The American Federation of, founded in 1909 to develop art and its appreciation. Chapter Membership: 451. Honorary President Hon. Robert Woods Bliss. President: Hudson D. Walker. Director: Thomas C. Parker. Headquarters: Barr Building, Washington 6, D. C.

Asiatic Association, American, founded in 1898 to study relations between Asiatic countries and the United States. Membership: 200. President R. M. Field. Secretary: John B. Chevalier. Headquarters: India House, Hanover Square, New York City. Annual meetings are held the third Thursday in October at India House.

Associated Press, founded in 1900 for the collection of news, photographs, and features. Serves more than 2,500 members and subscribers throughout the world. President: Robert McLean of the *Philadelphia Evening Bulletin*. Secretary: Lloyd Stratton. Headquarters: 50 Rockefeller Plaza, New York City. Scheduled meeting: April, 1946.

Astronomical Society, American, founded in 1899 to advance astronomy and closely related branches of science. Membership: 608. President: Harlow Shapley. Secretary: Dean B. McLaughlin, Observatory, University of Michigan, Ann Arbor, Mich. The Henry Norris Russell Lectureship was established in 1945. Scheduled meetings: February, 1946, New York City.

Audubon Society, National, organized in 1905 to arouse public appreciation of the value of, and recognition of the need of, conservation of wildlife, soil, plants, and water, and the interdependence of these natural resources. Membership: 75,000 individuals and 200 member societies with membership of 60,000 individuals; also, 1,600 non-member contributors. President: John H. Baker. Chairman of the Board of Directors: Ludlow Griscom. Headquarters: 1006 Fifth Avenue, New York 28, New York. Activities during 1945 included enrollment of 857,744

children throughout the United States and Canada in 13,686 Audubon Junior Clubs in schools, camps and youth organizations; spring and summer courses in natural history and conservation conducted at the Audubon Nature Center in Greenwich, Connecticut; Audubon Wildlife Screen Tours with ten famous nature lectures in forty principal Midwestern cities; Audubon staff lectures addressing 1,000 audiences reaching 850,000 individuals; protective warden service provided for wildlife on some 3,000,000 acres of land and water in Maine, Connecticut, New York, New Jersey, Pennsylvania, Florida, Louisiana, Texas and California.

Automobile Association, American (A.A.A.), founded in 1902 to provide a nation-wide network of service and protection for car-owning members and to work for the improvement of motoring conditions generally. Membership in A.A.A. clubs: Over 1,350,000. President: H. J. Brunnier; General Manager: Russell E. Singer. Headquarters: 17th and Pennsylvania Avenue, N. W., Washington 6, D. C. During 1945, which the Association termed the most critical year of the war for transportation, the organization intensified its efforts to impress upon all car owners the vital necessity for car and tire conservation. This program assumed an even greater urgency after V-E Day when a noticeable trend away from conservation practices threatened to bring about a transportation crisis of major proportions. The let-down inspired a letter from President Harry S. Truman, sent on the eve of the Potsdam Conference, asking the AAA to tell motor car owners that each of them owed it to himself and his country to conserve his vehicle and the rubber on it. This assignment was carried out through press releases, magazine articles, the radio, pamphlets and other material sent out by AAA national headquarters and 650 affiliated clubs and branches all over the country. After V-J Day the organization went full speed ahead on its program of reconvertng to meet the peacetime requirements of the motoring public. This includes stepped-up activity in the interests of a truly national network of superior type highways, and preparations for the expected tremendous increase in highway travel, forecast in AAA surveys. The organization also re-dedicated itself to its historic fight for fair motor vehicle taxation, and for State constitutional amendments prohibiting diversion of motor vehicle funds to other than highway uses. Two anti-diversion fights spear-headed by AAA clubs met with success in the November elections. These were in Pennsylvania and Kentucky, where such amendments were adopted by an overwhelming vote. The year also saw the end of the \$5 Federal Use Tax on cars, opposed vigorously and consistently by the AAA.

Automobile Manufacturers Association, founded in 1913 for service to the motor industry. Membership: 32. President: Alvan Macauley. Secretary: Albert Bradley. General Manager: George Romney. Headquarters: New Center Building, Detroit 2, Mich.

Bacteriologists, Society of American, founded in 1899 to promote the science of bacteriology and bring together American bacteriologists and other microbiologists for demonstration and discussion of methods and consideration of subjects of common interest. Membership: about 2,500. President: Dr. Stuart Mudd, University of Pennsylvania, Philadelphia. Secretary-Treasurer: Dr. L. W. Parr. Headquarters: George Washington University, 1335 H. St., N.W., Washington 5, D. C. Annual meeting for 1945 not held due to wartime emergency. Meeting in 1946 will be held May 21-24 in Book Cadillac Hotel, Detroit, Michigan.

Bankers Association, American, founded in 1875 to promote the welfare and usefulness of banks, secure uniformity of action on subjects of importance and provide opportunity for discussion thereon, and to provide educational opportunities for bank officers and employees. Membership: 15,613. President: Frank C. Rathje. Headquarters: 12 East 36 Street, New York 16, N. Y., 719-15 Street, N.W., Washington 5, D. C., 105 W. Adams Street, Chicago 8, Illinois.

Banking, American Institute of, founded in 1900 to further the education of bankers in the theory and practice of banking and in those principles of law and economics that pertain to the banking business, and to establish and maintain a recognized standard of banking education by means of official examinations and the issuance of certificates of graduation. Membership: about 60,000. Secretary: Floyd W. Larson. Headquarters: 12 East 36 Street, New York City.

Bar Association, American, founded in 1878 to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation and judicial decision, uphold the honor of the profession, encourage cordial intercourse among members of the Bar, and correlate activities of State Bar Associations. Membership: 35,000. President: Willis Smith. Executive Secretary: Olive G. Ricker. Headquarters: 1140 North Dearborn Street, Chicago, Ill. In 1945 the Ross Essay Prize was awarded to Robert A. Sprecher, Chicago, Illinois. See LAW.

Bible Society, American, founded in 1816 to encourage wider circulation of the Holy Scriptures without note or comment throughout the world. Membership: probably

over 15,000. President: Daniel Burke, LL.D.; General Secretaries: Dr. Eric M. North, Mr. Frank H. Mann, Mr. Rome A. Betts, Dr. F. W. Cropp, Dr. Robert T. Taylor. Treasurer: Rev. Gilbert Darlington. Headquarters: Park Avenue and 57 Street, New York City. Universal Bible Sunday will be observed Dec. 8, 1946. The 1946 annual meeting will be held May 9.

Bibliographical Society of America, founded in 1904 to promote bibliographical research and issue publications. Membership: 1160. President: R. W. G. Vail. Permanent Secretary: Nelson W. McCombs, 100 Washington Square, New York 8, N.Y. Mailing Address: P. O. Box 397, Grand Central Annex, New York 17, N.Y.

Blind, Inc., American Foundation for the, founded in 1921 to promote those interests of the blind which cannot be advantageously handled by local agencies. President: M. C. Migel. Executive Director: Robert B. Irwin. Headquarters: 15 West 16 Street, New York City. Activities include research, assistance and consultation service to local agencies, special services to individuals, scholarships, a reference and lending library, and manufacture of Talking Books for the blind.

B'nai B'rith (Sons of the Covenant), oldest Jewish service organization, founded in 1843 to further the unity of the Jewish people and to serve humanitarian and community causes through a program encompassing youth welfare, education, community and social service, interfaith understanding, defense of Jewish rights, philanthropy, Americanism. Membership: 240,000. President: Henry Monsky. Secretary: Maurice Bisgyer. Headquarters: 1008 K Street, N. W., Washington 1, D. C.

From Pearl Harbor to V-J Day, B'nai B'rith compiled a war service record expressed in the following figures: 527 members killed or missing in action and 502 decorated; 1,500 recreational facilities equipped for the Army and Navy; 650 fighting ships equipped with recreational material; \$900,000 contributed to the Red Cross and other United Nations relief agencies; \$700,000,000 worth of war bonds sold; 2,500,000 servicemen and women entertained.

B'nai B'rith's president was an official consultant to the American delegation to the United Nations Conference in San Francisco. In memory of Franklin D. Roosevelt, the B'nai B'rith Women created a Four Freedoms Library at the University of Illinois. B'nai B'rith's Vocational Service Bureau published two charts on the civilian uses of skills acquired in the Army and Navy. Both charts received world-wide acclaim by the armed forces and by agencies working to readjust discharged veterans.

All of B'nai B'rith's long-time agencies for service—Hillel Foundations, B'nai B'rith Youth Organizations, Anti-Defamation League, Americanism Department and Vocational Service Bureau—were re-tooled for postwar service. On behalf of its members abroad who survived the Nazi terror B'nai B'rith created a European Advisory Council to provide relief and rehabilitation assistance. The Leo N. Levi Memorial Hospital, sponsored by B'nai B'rith, launched the nation's first arthritis research institute. The new Wendell Wilkie Memorial Building in New York City had the support of B'nai B'rith, two of those departments occupy quarters in the building.

Botanical Society of America, Inc., established in 1906 as a clearinghouse for the botanists of America. It supports projects of general interest to botanists, provides an opportunity for the presentation and publication of research studies, and accepts and administers funds for certain purposes. The Society will hold its annual meeting in conjunction with the A.A.A.S. at St. Louis, Mo., March 27-30, 1946. The official publication is *The American Journal of Botany*. Membership: 1400. President: I. W. Bailey. Secretary: John S. Karling, Department of Botany, Columbia University, New York, N. Y.

Boy Scouts of America, founded in 1910 to promote the ability of boys to do things for themselves and others, to train them in Scoutcraft, and to teach them patriotism, courage, self-reliance and kindred virtues. Membership (Oct. 31, 1945) 1,927,991. President, Walter W. Head; Chief Scout Executive, Elbert K. Fretwell; Chief Scout, James E. West. Headquarters 2 Park Avenue, New York 16, N. Y. In 1945 major emphasis was placed on rebuilding Scouting throughout the seventy different lands where Scout organizations had existed before World War II. The World Friendship Fund was established and the first contribution allocated to the Philippines. Scouts worked at government requests for war service including the following: two War Loan Campaigns, for which the government made available flags and insignia to Units qualifying; General Eisenhower Waste Paper Campaign in March and April, resulting in 310,000,000 tons of waste paper—General Eisenhower authorized medals and recognition for Scouting Units in his name; the Green Thumb Campaign to grow food for freedom. Senior Scouting, including Air Scouting, Explorer Scouting and Sea Scouting, enrolled many young men. A new Senior Scouting Unit was authorized, the Senior Scouting Unit for boys following any or all Senior Programs.

Boys' Clubs of America, Inc., a national organization of Boys' Clubs for the development of boys physically, in vocational skills and character. Membership: 260 member

organizations with over 250,000 boy members. Chairman: Herbert Hoover. President: William Edwin Hall. Executive Director: David W. Armstrong. Headquarters: 381 Fourth Avenue, New York, 16. Boys' Clubs of America is making plans for a large expansion of services to boys and especially to older boys who face new employment and recreation problems.

Broadcasters, National Association of, founded in 1922 to foster and promote the development of the art of radio broadcasting; to protect its members in every lawful and proper manner from injustices and unjust exactions; to foster, encourage and promote laws, rules, regulations, customs and practices which will be for the best interest of the public and the radio industry. Membership: 870. President: Justin Miller. Executive Vice President: A. D. Willard, Jr. Secretary-Treasurer: C. E. Arney, Jr. Headquarters: 1760 N Street, N. W., Washington 6, D. C.

Business and Professional Women's Clubs, Inc., The National Federation of founded in 1919 to bring about the spirit of cooperation among business and professional women of the United States and to extend their opportunities and their sense of responsibility for social and economic conditions. Membership: over 91,000. President: Margaret A. Hickey. Acting Executive Secretary, Olive H. Huston. Headquarters: 1819 Broadway, New York City. The Federation's program for the year beginning July, 1945, Our World to Build, is a program of action for women who work. It is focussed on women's responsibility in politics, in economic development for jobs, in employer-employee relations, and toward a world of justice and order.

Camp Fire Girls, Inc. has pioneered since its origin in 1911 to develop a character-building recreational program now enjoyed by 340,250 teen-age members. With an impressive record of war service behind them, these girls mobilized themselves in 1945 for community service in peace.

"Hi, Neighbor!" was the special citizenship project carried on by Camp Fire Girls during 1945 to celebrate the organization's birthday, an annual custom. In this program the girls became better acquainted with the advantages and needs of their own neighborhoods. They also concentrated on the contributions made to each community by different racial backgrounds and foreign lands. A Neighborhood Fair provided a grand climax to the "Hi, Neighbor!" project. This event featured booths exhibiting "Neighborhood World Treasures," "Dolls of All Nations," "Service Men's Souvenirs from World Neighbors," and a "Neighborhood Hall of Fame."

This feeling of world friendship inspired several ceremonies held by Camp Fire groups throughout the nation to mark the opening of the San Francisco Conference of the United Nations. A delegation of girls presented a Treasure Chest of Books for French children to the official representatives of France at the San Francisco Conference. During the summer the emphasis on international good will was continued through a United Nations theme for the camping season. The 1946 birthday project is titled "At Home in the World" and will star the vital role of the home in building a family of nations.

On September 18, 1945, thousands of Camp Fire Girls observed a national "Share the Food Day" by eating meals typical of the meager diet of war-devastated nations. Cash savings in food cost were sent to the Edith M. Kempthorne Fund for furthering Camp Fire's international friendship program. In the Victory Loan Drive of 1945 Camp Fire Girls were active in the sale of bonds dedicated to occupational therapy for aiding the rehabilitation of the wounded.

President: Dr. Bernice Baxter. Secretary and National Executive: Miss Martha F. Allen. Headquarters: 88 Lexington Avenue, New York 16, N.Y.

Cancer Society, Inc., American founded in 1913 for the purpose of saving lives from cancer by educating the public about the facts of the disease. It does not treat patients, nor administer hospitals, clinics, or laboratories. Membership: 1,050, composed largely of leaders in the fields of medicine and science. President, Dr. Frank E. Adair, Secretary: Dr. Eugene P. Fendergrass. Headquarters: 350 Fifth Avenue, New York 1, N.Y. The lay educational program is conducted by the Field Army, numbering approx. 300,000 volunteer members. Mrs. Harold V. Milligan, National Commander. Highlight of its year's work is the educational and enlistment campaign conducted each April, designated by Congress as "Cancer Control Month." In 1945 for the first time the Society asked the public to support a program of fundamental research in the various fields of scientific activities involved in cancer control. The problems range from the need for more information on the behavior of normal and malignant cells and the differences between them, to the problem of devising improved methods of diagnosis and treatment. This research will be conducted under the direction of the newly formed Committee on Growth of the National Research Council of the American Academy of Sciences. The first allotment of \$500,000 has been made to this committee. Additional funds will be appropriated as available and as the committee develops recommendations. Service to the cancer patient is assisted by the State divisions of the Society under the

immediate and consistent supervision of the local medical profession.

Care of European Children, Inc., U.S. Committee for the, organized July 1, 1940, to bring children from war environment of Europe to homes in the United States. The organization has been responsible for some 2,000 children, 5 to 15 years old, Protestant, Catholic, and Jewish, representing 15 nationalities, and operates under special immigration procedure authorized by government. It sponsors unaccompanied European children not individually sponsored by parents or relatives. Program includes collection of funds, finding homes, placing children and providing for proper care. Honorary President: Mrs. Franklin D. Roosevelt. President: Marshall Field. Acting Director: Miss M. Ingeborg Olsen. Secretary: Miss Agnes King Inglis. Treasurer: Jackson Martindell. Headquarters: 215 Fourth Avenue, New York 3, N.Y.

Chamber Of Commerce, International, founded in 1920 to provide business men and organizations with a continuing mechanism for interchange of information, joint study, consultation and periodical conference; an organization for leadership in the field of international economic policy. Its activities, curtailed during the war, again are being expanded to refocus business viewpoints and enable the Chamber to offer full consultative assistance to the Economic and Social Council of the United Nations Organization and related agencies in the building of a solid economic base for peace. Membership National Committees in 31 countries, affiliated organizations in 18. President: Winthrop W. Aldrich of the United States. Chairman of the U. S. Associates, which is the re-organized group that has replaced the old American Section: Philip D. Reed, Executive Director John P. Gregg. Headquarters of the I.C.C. 38 Cours Albert Premier, Paris 8eme, France. Main office of the United States Associates 570 Lexington Avenue, New York, N.Y.; Washington office: 1615 H Street N.W.

Chamber of Commerce, United States Junior, an affiliated group of young men's organizations devoted to leadership training, civic service and development of active citizenship. Membership nearing 100,000, with many thousands still serving in the Armed Forces. Age limits: 21 thru 35. The organization was founded in 1920 and is now functioning in every state and territory of the United States, with associate members in Canada, all Central American countries, New Zealand, Australia, Great Britain, Brazil and Argentina. Headquarters: The LaSalle Hotel, Chicago, Illinois. President: Henry Kearns. Executive Vice-President: Rex McMorris. Its principal activities: Aviation projects, Juvenile, Sports Promotion, Employment and Job Training Opportunities for Returned Veterans, "Hold That Line" Safety Program, designed to reduce traffic and industrial accidents, "Community Face-Lifting," a program to beautify and modernize community business areas, Public Health Program prepared to cooperate with the existing health agencies in the elimination of social diseases, Fire Prevention Program designed to reduce fire loss in residential and business areas, a Governmental Affairs Activity presenting a program to stimulate thought and activity by young men upon matters of national, state and local importance. The principal contribution made by Jaycee participation is Leadership Training, "Young Men Learning Civic Consciousness and Responsibility Through Constructive Action." National magazine, *Future*. The 1946 Convention to be held in Milwaukee, Wisconsin June 25 thru 29.

Chamber of Commerce of the United States, established in 1912, primarily as a vehicle for the expression of national business opinion on important economic questions. Membership: 2,217 chambers of commerce and trade associations, 9,463 individual business men, and 6,353 firms and corporations. President, Eric A. Johnston. General Manager: Ralph Bradford. Headquarters: 1615 H Street, N.W., Washington 6, D.C. The Chamber is centering its attention particularly upon reconversion problems. Chamber spokesmen appeared before congressional committees to present a practical business viewpoint on pending legislation. Twelve service departments are maintained covering the main divisions of business activity. Publications include the *Nation's Business*, a monthly, *Business Action*, weekly, special legislative bulletins, and committee reports. Several special committees, besides the regular departmental committees, were engaged during the year in studies of important problems.

Cheautauque Institution, founded in 1874 for religious and educational purposes. President: Ralph H. Norton. Secretary: Charles E. Peirce. Headquarters: Chautauque, N.Y. A program of music, lectures, and religious services is conducted during July and August each year.

Chemical Society, American, founded in 1876 to advance chemistry, chemical research and knowledge, and the qualifications and usefulness of chemists; incorporated under Act of Congress, 1938. Membership: 48,100. President: Bradley Dewey. Secretary: Alden H. Emery. Headquarters: 1155 Sixteenth Street, N.W., Washington 6, D.C. The American Chemical Society Award in Pure Chemistry (sponsored by Alpha Chi Sigma fraternity) to Frederick T. Wall; the Borden Award in the Chemistry of Milk to Ben H. Micolet; the Eli Lilly and Company Award to Max A. Lauffer. No national meet-

ings; 12 local meetings in miniature; 3 regional meetings. Three new local sections chartered. ACS Educational Fund established.

Child Labor Committee, National, founded in 1904 to promote legislation dealing with child labor and related subjects, conduct investigations, advise on administration, and maintain an information service. Membership: about 15,000. General Secretary Gertrude Folks Zimand. Headquarters: 419 Fourth Avenue, New York 16, N. Y. Activities in 1945 included promotion of higher standards in state child labor and compulsory education laws to keep children in school to 16 as a postwar measure; field assistance to State groups working for improved laws; support of Federal aid to education and other measures to provide more and better education; study of part-time school and work programs under school supervision; participation in hearings and conferences on Federal and State bills affecting child labor and related subjects and in conferences called by the Children's Bureau and other Federal agencies to consider postwar needs of youth; a public information service, publication of a monthly bulletin, pamphlets, leaflets, magazine articles, etc.

China Society of America, The, founded in 1913 to promote friendly relations and a better understanding between the peoples of the United States and China. Membership: 500. President: Clark H. Minor. Headquarters: 570 Lexington Avenue, New York City 22. In addition to distributing information on China to schools and clubs and publishing *China* magazine, the Society holds dinners and luncheons throughout the year for prominent Chinese and Americans coming to and from China.

Christian Endeavor, International Society of, formed in 1885 to further the training of young people in the Christian life, among societies and unions of about 50 evangelical denominations in the United States and Canada. Membership: approximately 2,000,000. President: Dr. Daniel A. Poling. Executive Secretary: Carroll M. Wright. Headquarters: 41 Mt. Vernon Street, Boston 8, Mass.

Christians and Jews, The National Conference of, founded in 1928 to promote justice, amity, understanding, and cooperation among Protestants, Catholics, and Jews in the United States. Membership, 40,000. Co-Chairmen: Arthur H. Compton, Carlton J. H. Hayes, Roger W. Straus. President: Everett R. Clinchy. National Headquarters: 381 Fourth Avenue, New York City. The Conference sponsors a program of education in churches, schools, military training centers, and all types of community organizations. It sponsors Religious News Service, an objective news gathering and dispensing agency which provides news releases and feature materials for newspapers and journals. It has 55 regional and city offices and 300 Round Tables in various population centers.

Churches, The World Council of, established as a provisional committee after the world conferences at Oxford and Edinburgh in 1937 to unite the churches of the world on the federal principle for cooperative service and the promotion of Christian unity. Membership: 90 denominations in 30 countries. Vice-Chairmen: Dr. Marc Boegner, Archbishop S. Germaines, Dr. John R. Mott. General Secretary: Dr. W. A. Visser 't Hooft, Geneva; Assistant General Secretaries: Rev. Oliver S. Tomkins, London; Dr. Henry Smith Leiper, New York. Headquarters: 17 Route de Malagnou, Geneva, Switzerland; 297 Fourth Avenue, New York City 10, 21 Bloomsbury Street, London, W.C.1. The American Section meets in New York City on the first Tuesday in December. A Department of Reconstruction and Inter-Church Aid for the churches of Europe has been set up in Geneva.

Citizens National Committee, Inc. (formerly Citizens Emergency Committee on Nondefense Expenditures, Inc.), organized in July, 1941, to keep the public informed with respect to legislative proposals and administrative procedures, to assist Congress and other public officials in their effort to advance the economic welfare of the country, and to coordinate the public demand for efficient and adequate but prudent government. Chairman: John W. Hanes. Executive Secretary: Kenneth L. Pray. Headquarters: 2638 Sixteenth St. N.W., Washington 9, D.C.

City Managers' Association, The International, founded in 1914 to aid in the improvement of local government administration and to increase the proficiency of city managers. Membership: 900. President: J. R. French. Headquarters: 1813 East 60 Street, Chicago, Ill. Recent publications include *The Municipal Year Book 1945*, *Governmental Data for Small Council-Manager Cities*, *Planning for Postwar Municipal Services*, and *Monthly Administrative Reports for Cities*. Also publishes *Public Management*, a monthly journal; issues the "Municipal Management Series" consisting of eight practical manuals; and conducts in-service training courses and a management information service.

Civil Liberties Union, American, founded in 1920 to maintain the Bill of Rights for everybody, without exception. Membership: 6,000. Chairman of the National Committee: Prof. Edward A. Ross. Chairman of the Board of Directors: Rev. John Haynes Holmes. Director: Roger N. Baldwin. Headquarters: 170 Fifth Avenue, New York, N. Y. The Union continued during 1945 its intervention in court cases involving civil rights, in administrative

practices and rulings, and in legislation. Publications included the yearly report, *Liberty on the Home Front*, the *Civil Liberties Quarterly*, *Toward An International Bill of Rights*, and other pamphlets of current interest in civil liberties.

Civil Service Reform League, National, founded in 1881 to improve and extend the merit system in the public service. Membership, 8,000. President: Nicholas Kelley. Executive Secretary: H. Elliot Kaplan. Headquarters: 67 West 44th Street, New York 18, N.Y. In 1945 the League fought political interference with appointments in Federal war agencies, discouraged excessive expansion in Federal agencies. The sub-committees on Veteran Preference and on Demobilization and Reorganization of the Civil Service, of the League's National Committee on Post-War Civil Service Problems issued reports based on their studies of these problems. The sub-committee on Public Employer-Employee Relations carried on an intensive study preparatory to submission of its report. The League continues to give advisory services with respect to problems of administration, interpretation and enforcement of merit system laws to public personnel agencies and administrative officials.

Civitan International, nonprofit association of individual Civitan Clubs, now in its 26th year extending from Canada throughout the United States and to Mexico, whose purpose is best explained by the motto, Builders of Good Citizenship. Objectives are: (1) Building of good citizenship and promotion of international good will, (2) loyal support of our governments in peace and in war, (3) curbing of crime, (4) public safety and accident prevention, (5) fostering of all procedures designed to eliminate communicable diseases and improve the public health, (6) assistance to youth in all ways calculated to reduce juvenile delinquency and to inculcate in their practical incentives to be good citizens, and (7) rehabilitation of returning World War II veterans.

President: LeRoy D. Sauer, 42 North Main Street, Dayton 2, Ohio; President-Elect J. Edward Bailey, American Building, Richmond, Virginia; Immediate Past President: L. H. Gibson, 513 American Building, Nashville, Tennessee; Vice-Presidents: Oby T. Brewer, P. O. Box 1663, Atlanta, Georgia, and Oliver J. Swan, Hotel Tulsa, Tulsa, Oklahoma. Secretary: Rudolph T. Hubbard, 1525-27 Comer Building, Birmingham, Alabama. Treasurer: H. S. Strawn, 183 W. Fourth, Charlotte, North Carolina. Judge Advocate: William F. Parker, 810 Ingraham Building, Miami, Florida. Sgt.-At-Arms, Robert J. Ward, Watts Building, Birmingham, Alabama. Chaplain: Dr. Herbert Spauld, 528 Moravian Lane, Charlotte, North Carolina. Official publication, *The Civitan*, published monthly except July. Headquarters: 1525-27 Comer Building, Birmingham, Ala.

Common Council for American Unity, founded in 1919 to continue work begun by the U.S. Committee on Public Information; it became an independent organization in 1921, and its name was changed from Foreign Language Information Service to Common Council for American Unity in 1940. The purpose of the Council is to help create unity and mutual understanding among the American people; to overcome intolerance and discrimination because of foreign birth or descent, race or nationality, and to help the foreign-born and their children to solve their special problems of adjustment. Executive Director: Read Lewis. Headquarters: 20 West 40th Street, New York City. Publication: *Common Ground*, a quarterly magazine.

Composers and Conductors, The National Association for American, founded in 1933 by the late Henry Hadley to advance the interest of the American Composer and the American Conductor and to secure a hearing for serious works of merit. Leon Barzin, President. Membership in every state; headquarters, 15 West 67th St., New York City. The Association presents a series of six Sunday evening concerts at the Times Hall, 240 West 43rd Street during the season 1945-46, a series of afternoon musicales at the Henry Hadley Studio, 15 West 67th Street, and a concert at the Waldorf-Astoria. In addition to regular meetings there are conferences of member composers with Publishers, Radio and Recording representatives; and a series of Musical Films were shown, featuring scores by American composers, at the Museum of Modern Art. The Association includes in its activities the publication of scores by composer members and cooperates with the leading orchestras, broadcasting stations, recording companies and publishers in the promotion of American music. In 1944-45, reading rehearsals of American compositions were presented on Friday afternoons over Station W.N.Y.C. Prizes offered for compositions especially adapted to young musicians, consist of (a) Solo String with Orchestra; (b) Solo Wood Wind with Orchestra; (c) Solo brass or percussion with Orchestra—prizes of \$100.00 each, a broadcast performance publication and distribution.

The Henry Hadley Memorial Library, Curator, John Tasker Howard, housed in the American section of the Music Division of the New York Public Library at Fifth Avenue and Forty-second Street, contains a complete file of American works in the larger forms, available for examination by conductors and soloists. Various awards and citations are given annually by the Association for

outstanding service to American music. Among the recipients of the Henry Hadley medal, the highest award, are Mrs. Edward MacDowell, Dr. Howard Hanson and Gene Buck.

Composers, Inc., The League of, founded in 1923 to further the works by living composers of all nationalities, as well as to help composers by commissions for new works and general promotion of their compositions. Executive Chairman: Mrs. Arthur M. Reis. Headquarters: 180 West 56th Street, New York, N. Y. The League publishes a quarterly magazine, *Modern Music*, the only critical magazine in this country devoted to contemporary music. The League of Composers season includes concerta, opera and broadcasts, and commissions new works for other organizations. The League has laid particular emphasis on introducing young modern composers to a New York public, having commissioned sixty American composers during the past years. A group of young composers this season were elected to a Program Committee and will be in charge of the New York concerts. A work commissioned by the League for orchestra and voice will be written by Lukas Foss and will receive its first performance within the year.

Consumer-Retailer Council, Inc., National, founded in 1937 to enable consumers and retailers to work out together their mutual problems. Members: American Association of University Women, American Home Economics Association, National Board of the Young Women's Christian Associations, National Council of Jewish Women, American Retail Federation, National Association of Food Chains, National Retail Dry Goods Association, National Retail Furniture Association, Retail Credit Institute of America. Associate Members: National Better Business Bureau, Illinois Federation of Retail Associations, Pennsylvania Retailers' Association. Chairman: Theodore B. Griffith, Managing Director Roger Wolcott. Headquarters: 8 West 40th Street, New York City. The National Retail Furniture Association and the Retail Credit Institute of America joined the Council during the year. The number of retail subscribers also increased substantially. New publications issued during 1945 include *A Study of Labeling, Suggestions on How to Set Up a Local Consumer-Retailer Council, Building Sound Consumer-Business Relations. The Eighth Annual Report*. Other publications include *How Informative Labels Help You Stretch Your Dollars, Looking at Clothing and Textile Labels, Federal and State Laws Affecting Labeling and The Grade Labeling of Canned Fruits and Vegetables*. The *NCRC News* is published monthly. High schools, colleges and State departments of education located in the 48 States, the District of Columbia, Hawaii, Puerto Rico and Canada, requested Council publications during the year. In comparison with the previous year, the number of high schools using Council material increased 15 per cent.

Consumers League, National, founded in 1899 to awaken consumer responsibility for conditions under which goods are made and distributed, and through investigation, education, and legislation to promote fair labor standards; this includes State and Federal minimum wage laws, child labor legislation, social security measures, limitation of hours of work for women, proper enforcement of labor laws. Membership: 15,000, including State and National Leagues. President: Alice Hamilton, M.D.; Chairman of the Board: Everett Moore Baker. Headquarters: 348 Engineers Bldg., Cleveland 14, Ohio.

Consumers' Research, Inc., founded as the Consumers' Club in 1927 and incorporated in 1929 to provide unbiased information and counsel on goods bought by the ultimate consumer. Number of subscribers: 50,000. President and Technical Director: F. J. Schlink. Secretary: Clark C. Willever. Headquarters: Washington, N. J. The monthly issues of *Consumers' Research Bulletin* (and an annual cumulative issue of about 200 pages) present the findings of CR's tests on washing machines, refrigerators, vacuum cleaners, and many other new electrical appliances, rating them by brand name as *Recommended*, *Intermediate*, or *Not Recommended* on the basis of comparative performance. In addition, there are numerous discussions of the outstanding features of the 1946 automobiles, of important matters connected with the design and equipment of the home, as well as analyses of a wide range of household cleaning preparations and detergents. Monthly features are a "Consumers' Observation Post" and ratings of motion pictures and phonograph records.

Consumer's Union of United States, Inc., founded in 1936 as a nonprofit research agency which carries on both technical and economic studies, the results of which are published in the monthly *Consumer Reports* and the weekly *Bread & Butter*, to provide guidance for ultimate consumers. Membership: 100,000. President: Colston E. Warne. Editor: Madeline Ross. Secretary: Harold Aaron. Director: Arthur Kallet. Headquarters: 17 Union Square West, New York, N. Y. Consumer's Union is testing and reporting on new electrical and mechanical products—including radios, automobiles, refrigerators, vacuum cleaners, washing machines, pressure cookers, etc.—in addition to its usual reports on foods, textiles, drugs, cosmetics and other consumer goods. In addition, it is featuring articles on health and medicine.

Cooperative League of the U.S.A., The, founded in 1916 as a national educational federation of consumer cooperatives devoted to the extension of the consumer cooperative owned business enterprises. Membership: 1,500,000 in 22 affiliated regional and national associations. President: Murray D. Lincoln. General Secretary: E. R. Bowen. Headquarters: 843 South Dearborn, Chicago 4; 726 Jackson Place, N.W., Washington 6, D.C.; 167 West 12 St., New York City 11. The 14th Biennial Congress of The Cooperative League reported that there were two and a half million American families who are members of consumer and purchasing cooperatives, doing a business estimated at \$800,000,000. The cooperatives are growing fast, the League declared, but war conditions have brought serious problems. At the close of 1944 more than 150 mills, factories, and oil refineries were owned by the co-ops producing goods for distributors through wholesale and retail cooperatives.

Cotton Manufacturers, National Association of, founded in 1854 for service to cotton mills and rayon weaving mills in the northeastern section of the United States. Membership: about 450. President: Russell T. Fisher. Headquarters: 80 Federal Street, Boston, Mass. Student Honor Medals awarded in various textile schools annually.

Credit Men, National Association of, founded in 1896 as a nonprofit making organization of manufacturers, wholesalers, and bankers affiliated for the promotion of wholesome business by maintaining a sound credit structure. Membership: 23,000. President: Robert L. Simpson. Executive Manager: Henry H. Heumann. Headquarters: One Park Avenue, New York City 16.

Credit Union National Association, Inc., founded 1934 to organize and service the credit unions in the United States and Canada. Membership: 53 Leagues serving 4,000,000 members. President: R. A. West, Managing Director, Thomas W. Doug. Headquarters: 1342 East Washington Avenue, Madison, Wisconsin. Canadian credit unions were accepted to membership in 1940, and the Leagues include eight in Canada. The eleventh annual meeting will be held in May, 1946.

Daughters of the American Revolution, National Society of, founded in 1890 for historical, educational and patriotic purposes. Membership in 1945, about 145,000 members in 2,570 chapters. Mrs. Julius Y. Talmadge, President General, Administration Bldg., 1720 D Street, N.W., Washington, D.C.

Society's headquarters are located in Washington, D.C., comprising one city block, including Memorial Continental Hall, a building of state rooms with auditorium seating 1600; Administration Building, housing Society's offices; and Constitution Hall, an auditorium seating 4,000—acclaimed concert hall of the city.

Society's record of War Work: From D.A.R. War Fund—collected from voluntary contributions by members during period of war. Over \$400,000.00 expended from this fund, through the American Red Cross, for the purchase of equipment for the Blood Plasma Program, i.e. 88 Mobile Blood Plasma Units, located in various cities; 18 stationary Blood Donor Centers, located in cities throughout the United States; Station Wagons, Sedans, Trucks, Canteens, Sterilizer, Heater and Equipment.

For the U.S. Army—Wired Program Distribution System at Vaughan General Hospital at Hines, Ill., \$61,200.00; 5 station, individual selective head-set equipment, for 2,500 bed patients.

For the U.S. Navy—3 Mobile Photo-fluorographic Units (auto trailer) for U.S. Navy Medical Corps, 7 portable X-Ray units for hospital ships; 3 field ambulances; \$56,682.00.

For the U.S. Public Health Service Hospitals—33 Mills Sono-Vision Projectors (Portable Motion Picture Machines) at \$570 each—\$18,810.00.

Steel encased Hammond Electric Organ for Aircraft Carrier, \$1,500.00; triptychs (art altar pieces for Armed Forces) \$2,000.00; metal body locaters—28, purchased by Junior D.A.R.—\$9,800.00.

In addition, as war work: War Bonds and stamps subscribed, \$156,804,848.99; Buddy Bags made for servicemen 40,000; L.C.I.—82 ships sponsored by Society; Post War Employment program launched for personnel of L.C.I. Ships.

The Society has 24 active national committees covering patriotic, educational and historical fields. Most important among these is the Approved Schools program, to which \$77,640.00 was subscribed in 1945, whereby 14 mountain schools are assisted by D.A.R. funds. Two of these schools in the southern mountains are entirely owned and operated by the D.A.R.

Patriotic education for better citizenship is furthered by the Society in aiding underprivileged youths of all races, creeds and color. The Junior American Citizens Clubs, Girl Home Makers, Good Citizenship Pilgrims, and the mountain schools as mentioned above, are all examples.

The D.A.R. Manual for Citizenship, first published in 1921, printed in English and translated in 17 other languages, has been widely distributed. To date over 7,000,000 copies have been distributed to new citizens.

The principal historic project at present is the Society's undertaking to finance the building of the Bell Tower to house the Bells of the great carillon at Valley Forge, Pa. This tower is being subscribed by donations from members by recording names on metal plates to be placed in the Tower of all American patriots, from the American Revolutionary War, through and including World Wars I and II.

Official publications of the Society, namely, the *National Defense News* and the *National Historical Magazine*, bring these activities and others to the attention of members and friends.

Daughters of Union Veterans Of The Civil War, 1861-1865, Inc., organized in 1885 to perpetuate the memory and loyalty of their fathers. It is affiliated with the Grand Army of the Republic and kindred orders; the Women's Patriotic Conference on National Defense; and the Women's Interests Section, Public Relations, War Department. During the past year, ending Oct. 1, the National organization gave \$1,900.00 to the Grand Army of the Republic; added \$425.00 to their Scholarship Fund at Lincoln Memorial University; and sent \$11,000.00 to the American Red Cross for Clubmobile Service Fund. In addition, members contributed to State and local defense projects, educational scholarships and Red Cross activities. The National President elected October 3, 1945, is Mrs. Emma R. McLaughlin, 2147 Marshall Ave., Elm Grove, West Virginia. The organization owns its Headquarters, 1826 18th St., N.W., Washington, D.C., which is the permanent residence of the National Treasurer. Present membership, 35,000.

Democracy, Council for, founded in August, 1940; a social action group for the defense and extension of democracy. Chairman, Board of Directors, Raymond Swing; President, Ernest Angell; Executive Director, James E. Greer; Assistant Director, Warren Brown. National Board of Directors (150 members). Headquarters: 11 West 42nd Street, New York City. A non-political, non-partisan group, the Council's aim is to stimulate citizen participation in action to meet the issues of democracy. It uses radio, visual aids, news releases, pamphlets, speakers and a semi-monthly bulletin to achieve this purpose. It specializes in program planning for and assistance to already organized groups.

Democratic Action, Union for, founded May 10, 1941, to carry on a two-front fight for democracy, at home and abroad, to oppose totalitarianism in all forms, to organize American liberals to give progressive meaning to the sacrifices made in the war against fascism. Membership 10,000. Chairman: Dr. Reinhold Niebuhr, National Director, James Loeb, Jr., Headquarters, 819 13 St. N.W., Washington, D.C.

Dental Association, American, founded in 1859 for educational purposes. Membership: about 60,000. President: Walter H. Scherer. General Secretary: Harry B. Pinney. Headquarters: 222 East Superior Street, Chicago, Illinois. The 1944 meeting was held in Chicago, Illinois. See DENTISTRY.

Dietetic Association, The American, founded in 1917. Its objective is to improve the nutritional status of human beings, to bring about closer cooperation among dietitians and between dietitians and workers in allied fields, and to improve conditions and raise the standards of dietary work. Membership: 7,500. President: Mrs. Bessie Brooks West. Executive Secretary: Gladys E. Hall. Headquarters: 620 North Michigan Avenue, Chicago 11, Illinois.

Documentation Institute, The American, founded in 1937 for the promotion and development of documentation in scholarly and scientific fields. The Institute was organized as a nonprofit corporation, with members nominated by scholarly and scientific agencies. President: Watson Davis Secretary: Helen M. Davis. Headquarters: Science Service Building, 1719 N Street, N.W., Washington 6, D.C. The annual meetings are scheduled for Jan. 31, 1946, and Jan. 30, 1947, in Washington, D.C.

Dogs for Defense, Inc., founded in January, 1942, for the procurement of dogs for the Armed Forces of the United States. President, H. I. Caesar; Secretary, Mrs. Wm. H. Long, Jr. Headquarters: 22 East 60th Street, New York City 22. Since its inception the organization has delivered, without expense, thousands of dogs to the Armed Forces and is now assisting in the replacement of surplus dogs.

Eagles, Fraternal Order of, a fraternal and beneficial Order founded in 1898. Membership, 1,000,000. Grand Worthy President: Edward F. Post. Managing Organizer: M. L. Brown. Chief Auditor: John A. Abel. Financial Advisor: E. J. Balsiger. Grand Secretary: Chas. C. Guenther. Headquarters: Kansas City, Missouri. The Order has 150,000 members in Military Service, with 1272 subordinate units purchasing \$27,000,000 in War Bonds.

East and West Association, The, organized in 1941, and devoted to new and better understanding between peoples through mutual knowledge. President: Pearl S. Buck. Secretary: Albert H. Walsh. Headquarters: 40 East 49 Street, New York City. During 1945, the Association arranged and conducted forums and courses on the peoples of the world in New York, Philadelphia, Springfield (Mass.), Detroit, Chicago, Boston, South Bend, etc. It

has also arranged special institutes for librarians and teachers. It continues to publish study outlines, picture portfolios about various peoples and reading lists. It has introduced a new character, Johnny Everyman, into regularly appearing comic books. A new dramatic unit which tours the country, the Living Chinese Theatre, has been established. The Open Door, sponsored by forty ministers and rabbis, mediates cases of discrimination arising from race, color or religion.

Economic Association, American, founded in 1885 to encourage research, thought and discussion, and issue publications. Membership: 4,159 members; 1,754 subscribers. President: I. L. Sharfman. Managing Editor of *American Economic Review*: Paul T. Homan. Secretary-Treasurer and Editor of *Proceedings*: James Washington Bell. Headquarters: Northwestern University, Evanston, Ill. Chief papers for the annual meeting in January, 1946, Cleveland, O., published in *Proceedings*, deal with the problem of "full employment," American economy in the interwar period, postwar labor relations, monetary policy, changing structure of the American economy, problems of foreign areas, new frontiers in economic thought, postwar shipping policy, monopoly and competition, postwar railroad problems, international investment, recent developments in public utility regulation, international cartels. A quarterly journal, the *American Economic Review* covers a wide range of economic subjects of vital and current importance. A Directory, with annual supplements, contains a special-purpose, "who's who" account of members, together with classification by fields of subject matter and geographical location. An information booklet is also published. The Association is affiliated with the American Council of Learned Societies and the Social Science Research Council.

Economic Development, Committee for, an independent, nonpolitical, nonprofit corporation organized by American businessmen in 1942 to help commerce and industry make its maximum contribution towards maintaining high levels of productivity and employment in the postwar period. To carry forward this objective two divisions have been organized: (1) the Field Development Division (Marion B. Folsom, Chairman) which is to stimulate and encourage company-by-company planning in communities throughout the nation, and (2) the Research Division (Ralph E. Flanders, Chairman) which has initiated studies into the broad problems of government and business, seeking to establish those principles needed in the creation of "climate" favorable to business expansion. There are at present 2,200 community committees. It is estimated that between 40 and 50 thousand business men are cooperating with the work of the C.E.D. Chairman of the Board of Trustees: Paul G. Hoffman. Executive Director: C. Scott Fletcher. Director of Information: P. D. Fahnestock. Headquarters: 285 Madison Ave., New York 17, N.Y. See *TAXATION* under *Postwar*.

Economic Entomologists, American Association of, founded in 1889 to promote the study and to advance the science of entomology, and to publish the *Journal of Economic Entomology*, etc. Membership: 1,751. President: D. L. Van Dine. Secretary: Ernest N. Cory. Headquarters: College Park, Md. The 1945 meeting was held in Dallas, Texas.

Economic Research, Inc., National Bureau of, founded in 1920 to encourage investigation, research and discovery, and the application of knowledge to the well-being of mankind; and in particular to conduct exact and impartial investigations in the field of economic, social, and industrial science. Membership: 27 members of the Board of Directors. President: Shepard Morgan. Executive Director: William J. Carson. Director of Research, Arthur F. Buris. Headquarters: 1819 Broadway, New York, N. Y. Seven publications were issued in 1945 dealing with production and productivity, national income, capital formation, business financing, business cycles, etc.

Education, American Council on, a council of national educational associations, organizations having related interests, approved educational institutions, State departments of education, and city school systems; founded in 1918 as a center of cooperation and coordination in the field of education. Membership: 840 organizations and institutions. President: George F. Zook. Chairman: Alexander J. Stoddard. Headquarters: 744 Jackson Place, Washington 6, D.C. The Council acts as liaison agency between educational institutions and the government, and as a clearing house for information and the exchange of opinion. Since the cessation of hostilities it has inaugurated several postwar projects for the expansion of educational facilities and the improvement of educational programs. The Council publishes reports of its research projects, other monographs, psychological tests, and a quarterly journal, *The Educational Record*.

Education Association of the United States, National (N.E.A.), founded in 1857 to advance the interests of the teaching profession, promote the welfare of children, and foster the education of all the people. Membership: 851,605. President: Mr. F. L. Schagle. Executive Secretary: Willard E. Givens. Headquarters: 1201 Sixteenth Street, N.W., Washington 6, D.C. See *EDUCATION*.

Education Fellowship, American (formerly *Progressive Education Association*), incorporated in 1944 to develop

and promote progressive principles of education through local chapter organizations, field conferences, preparation and distribution of educational materials, a Service Center for members, and publication of a journal, *Progressive Education*. Membership: about 8,000. Director: Vinal H. Tibbetta. Headquarters: 289 Fourth Avenue, New York City 10. See *EDUCATION*.

Education-Recreation Council, National, a conference body of national agencies associated for the purpose of exchanging information and studying common problems, founded in 1933. Membership: 24 private and 11 Federal agencies. Chairman: Miss Norma J. Sims. Vice-Chairman: G. Ott Romney. Secretary: E. Urner Goodman.

Electrical Engineers, American Institute of, founded in 1884 for the advancement of the theory and practice of electrical engineering and allied arts and sciences, and maintenance of high professional standing among its members. Membership: 24,500. President: W. E. Wickenden. Secretary: H. H. Henline. Headquarters: 88 West 39th Street, New York City. 1946 conventions. New York City, January 21-25; Detroit, Mich., June 24-28; Seattle, Wash., during week of August 26-30. 1946 District Meetings: Buffalo, N.Y., Asheville, N.C., San Antonio, Tex., and Fort Wayne, Ind.

Elks, Benevolent and Protective Order of, a fraternal organization founded in 1868. Membership: 750,000. Grand Exalted Ruler: Wade H. Kepner; Grand Secretary: J. E. Masters. Headquarters: Elks National Memorial Building, Chicago, Ill. A National War Commission is working out detailed plans for the rehabilitation of veterans. The Order maintains at Bedford, Va., a home for aged and indigent members. An Elks National Foundation Fund aids crippled children, tubercular patients, and grants scholarships. Expenditures for charitable and welfare purposes, exclusive of war bonds and funds for the use of the War Commission, amounted to almost \$4,000,000 in 1945. The national journal is *The Elks Magazine*.

English Institute, The, founded in 1939 to afford an opportunity for mature scholars in the field of English to meet together in a series of informal conferences to discuss questions of literary and philological research. Chairman: Ernest Hunter Wright. Secretary: James L. Clifford. Barnard College, Columbia University, New York. Selected papers read at the sessions are published in the *English Institute Annual*. The next session will be held at Columbia University, September 9-13, 1946.

English-Speaking Union of the United States, founded in 1920 to draw together in the bond of comradeship the English-speaking people of the world. It cooperates with the English-Speaking Union of the British Empire, Dartmouth House, London. Membership: about 15,000. Headquarters: 19 East 54th Street, New York City. President: James R. Angell. Chairman: Henry J. Fisher. Treasurer: Charles A. Wight. General Secretary: Mrs. W. Henry France.

Ethnological Society, American, founded in 1842. The Society meets regularly at the American Museum of Natural History for lectures and discussions of scientific work and problems in anthropology. It publishes a monograph series of anthropological and linguistic researches. Membership: 252. President: Marian W. Smith. Secretary: Esther S. Goldfrank. Columbia University, New York City. See *SMITHSONIAN INSTITUTION*.

Eugenics Society, Inc., American, founded in 1926 to promote education and social action relating to eugenics. Membership: 500. President and acting executive officer: Dr. Maurice A. Bigelow. Secretary: Chauncey Belknap. Headquarters: 1790 Broadway, New York 19, N.Y.

Exchange Club, The National, founded in 1911 for the purpose of educating, improving, and developing the capabilities of the members of the clubs chartered by this corporation and of the citizens of the communities, municipalities, and states in which such clubs are chartered. Membership: 40,000. National President: Dr. Stewart W. McClelland. National Secretary: Herold M. Harter. Headquarters: 335 Superior Street, Toledo, Ohio. As an educational service, the Club publishes an official, monthly publication, *The Exchange*. This magazine reaches the individual members of all Exchange Clubs and carries material that is used by Exchange Clubs locally in presenting the general educational program to the public.

Farm Bureau Federation, American, organized in 1920 to meet and solve the pressing economic problems of agriculture. Membership: 900,000. President: Edward A. O'Neal. Secretary-Treasurer: R. B. Corbett. Headquarters: 58 East Washington, Chicago, Ill. Since its inception, the Federation has labored to further such projects as adequate farm prices, better farm-to-market roads; adequate credit facilities; freedom of competition among transportation agencies; solution of problems of irrigation; adequate appropriations for the Forest Service; development of rural youth programs.

Farm Chemurgic Council, National, organized in 1934, to advance the industrial use of American farm products through applied science. Membership: 4,000. President: Wheeler McMillen. Secretary: Ernest L. Little. Headquarters: 50 West Broad Tower, Columbus, Ohio. Eastern Office 350 Fifth Ave., N.Y.C. Southwestern Office,

Chamber of Commerce Bldg., Oklahoma City, Oklahoma. The Council has scheduled many meetings for 1946.

Farmers' Cooperatives, National Council of, founded in 1929 to serve, represent, and coordinate, nationally, the program and efforts of farmers' cooperative purchasing and marketing associations. Membership: 4,600 associations. President: Homer L. Brinkley. Executive Secretary: John H. Davis. Headquarters, 1731 Eye Street, N.W., Washington 6, D.C. The regular meeting of Council delegates from all parts of the nation will be held in Chicago, Jan. 7-11, 1946.

Farmers' Educational and Cooperative Union of America, founded in 1902, and generally known as the National Farmers Union, is devoted to assuring security of farm families on the land, in an economy of abundance brought about by a free exchange of goods and services. Farmers' Union works in the fields of education, legislation, and cooperatives to improve the position of family farmers. Membership: 165,000. President: James G. Patton. Vice-president: Herb Rolph. Secretary-Treasurer: Emil Loriks. Headquarters: 3501 E. 46th Avenue, Denver, Colorado.

Federal Union, Inc., founded 1939, was incorporated in 1940 as a non-profit educational membership association to promote "education in the basic principles of federal union as exemplified in the Constitution of the United States with a view to attaining world order by a federal union of democratic peoples." President: Clarence K. Streit. Secretary: Brice Toole. Headquarters: 700 Ninth St. N.W., Washington 1, D.C. The association at its fifth annual national convention, Pittsburgh, Pa., Nov. 16-18, 1945, decided to concentrate in 1946 on the publication of a new monthly journal of opinion and discussion to be edited by Mr. Streit. It will be a clearing-house, among other things, for all important developments in thought and action throughout the world in the problem of securing liberty and peace in the atomic age through world government. The U.S. Treasury has ruled that contributions to Federal Union are deductible from taxable income, because of the educational character of its activity.

Field Service, American, a volunteer ambulance service on active duty with Allied troops overseas, with men and vehicles evacuating battle wounded in the Italian, French, and Burma theaters. Enlistments are open to men in limited service classifications of Selective Service. The American Field Service was originally organized at the start of World War I and served throughout that conflict with the French Armies. In 1939 the ambulance service was actively reorganized. The renewed Service was sent to France where it served until the German occupation. In 1941, in answer to a request from General Wavell, the volunteer ambulance corps was assigned to British forces in the Middle East, where it was attached to Montgomery's Eighth Army and fighting French forces. As a result of the work done by the AFS in the Desert campaign, a contingent was assigned to British and Indian forces at the Burma front in 1943. During 1944 they served in the Imphal sector and along the Tiddim and Tamu roads. Following the invasion of Italy, the units which had served in the Middle East were transferred to Italy and attached to the Eighth and Fifth Armies. They served there in every major engagement including the battle of Cassino and throughout the Anzio beachhead operations. During 1944 another new unit was formed and is now serving with the French Army in France. Headquarters: 60 Beaver Street, New York, N.Y.

January, 1945, one AFS Ambulance Car Company was transferred from the Italian theater to operate under the command of Montgomery's 21 Army Group in Holland and Germany. They were among the first units into Belsen Concentration Camp and worked there until its final destruction by Allied-set fire. The AFS French units participated in Southern France and Vosges/Alsace campaigns, crossing the Rhine into Germany with the First French Army. The Burma units operated throughout that entire campaign through victory at Rangoon. They continued their work until repatriation to the States in November 1945. A member of this unit was awarded the George Medal, highest honor accorded by the King to a non-British civilian. In World War II the American Field Service suffered a casualty rate of 14%, and has been honored by every division and army they've served including the U.S. 5th Army. AFS is to continue on as a peacetime organization. After World War I it instituted a program of French-American exchange scholarship, and again this program is to be carried on. This time it is expected the scholarship will include men of all Allied nations that AFS has served.

Fire Protection Association, National, founded in 1896 to promote the science and improve the methods of fire protection and prevention, to obtain and circulate information, and to secure the cooperation of its members in establishing safeguards against fire loss. Membership: 10,262. President: Richard E. Verner. General Manager: Percy Bugbee. Headquarters: 60 Battery March Street, Boston, Mass. See FIRE PROTECTION.

Fire Underwriters, National Board of, an educational, factual, and engineering organization founded in 1866 and supported by the capital stock fire insurance business. Membership: 208. President: F. A. Christensen. General

Manager: W. E. Mallalieu. Headquarters: 85 John Street, New York City. The 1946 meeting will be held May 23 in New York City.

Food Technologists, The Institute of, established in 1939 to provide a professional organization which will facilitate interchange of ideas, stimulate and promulgate the results of research and work in the application of science to the food industry, and encourage the development of food technology as a profession. Membership: about 2,000. President: F. W. Tanner. Secretary-Treasurer: George J. Hucker. Geneva, New York. Regional sections have been granted charters in Southern California, Northern California, New England, St. Louis, New York, Florida, Great Lakes, Western New York and Chicago.

Foreign Policy Association, Inc., founded in 1918 to carry on research and educational activities to aid in the understanding and constructive development of American foreign policy. Membership: 30,000. President: Frank Ross McCoy. Secretary: Dorothy F. Leet. Headquarters: 22 East 38 Street, New York City. The Association publishes a weekly *Bulletin* including the Washington News Letter; semi-monthly *Foreign Policy Reports*, and *Headline Series*. The annual meeting was held in December, 1945. Discussion luncheons are scheduled periodically at the Waldorf-Astoria, New York City, and in thirty-two branch cities.

Foreign Relations, Inc., Council on, a nonpartisan, non-commercial research organization, founded in 1917 to study the international aspects of America's political, economic, and financial problems. Membership: 650. President: Russell C. Leffingwell. Vice Presidents: Isaiah Bowman and Allen W. Dulles. Executive Director: Walter H. Mallory. Headquarters: 58 East 68th Street, New York City. The Council holds meetings and conferences, and maintains a reference library on international affairs. It carries on a program of research and publishes: a quarterly review, *Foreign Affairs*, two annuals, *The United States in World Affairs* and *The Political Handbook of the World*; and individual volumes on international questions. In 1944 the Council acquired its new headquarters, known as the Harold Pratt House, at the corner of Park Avenue and 68th Street. It was formally opened by Secretary of State Stettinius on April 6th, 1945.

Foresters, Society of American, founded in 1900 to represent, advance, and protect the interests and standards of the profession of forestry and to provide a medium for the exchange of professional thought. Membership: 4,708. President: Dr. Henry Schmitz. Executive Secretary: Henry E. Clepper. Headquarters: Mills Building, Washington, D.C.

Forestry Association, The American, founded in 1875, is a citizens' organization for the advancement of intelligent management and use of the country's forests and their related resources of soil, water, wildlife, and outdoor recreation. Membership: 15,000. President: W. S. Rosecrans. Executive Director: Ovid Butler. Headquarters: 819 Seventeenth Street, Washington 6, D.C. In addition to the publication of a monthly magazine, *American Forester*, the Association carries on educational projects in various fields.

Foster Parents' Plan for War Children, Inc., founded in 1936 to help children of all nationalities suffering as a result of war. Executive Chairman: Edna Blue. Secretary-Treasurer: Ann Landross. Director, Public Relations: Robert Yaller. Executive Secretary: Eric G. Mugginger. Deputy: Mrs. Ivy Mason. British headquarters: 95 Coleman Street, Wool Exchange, London EC 4, England. American headquarters: 55 West 42nd Street, New York City. The Plan operates 56 projects in England, France, Malta, Italy, Belgium and Holland, schools for farmers, nurses and social workers, as well as hostels for children of all nationalities—Polish, Czech, French, Dutch, Belgian, Spanish, Austrian, Norwegian, German, Italian, Maltese and British.

Fraternal Congress of America, National, founded in Washington, D.C., November 16, 1886, to unite all fraternal benefit societies of America for mutual improvement and concert of action. Membership: 105 societies. President: Walter C. Below. Secretary-Treasurer and Manager: Foster F. Farrell. Headquarters: 35 East Wacker Drive, Chicago 1, Ill. The 1946 meeting will be held in September.

Friends Service Committee, American, founded in 1917, and representing the Religious Society of Friends in fields of social action, engaging in both domestic and foreign projects to express the Quaker principle that constructive and nonviolent service can resolve conflicts. Honorary Chairman: Rufus M. Jones. Chairman: Henry J. Cadbury. Executive Secretary: Clarence E. Pickett. Headquarters: 20 South 12th Street, Philadelphia 7, Pennsylvania. Public Committee meetings are held monthly in principal cities.

Future Farmers of America (F.F.A.), founded November, 1928, as national organization of, by, and for farm boys studying vocational agriculture in public secondary schools. Primary aim, development of agricultural leadership, cooperation, and citizenship. Specific purposes intend to strengthen confidence of farm boys and young men in their work; create and nurture a love of country

life and intelligent choice of farming occupations; improve the rural home; encourage thrift, scholarship, and organized rural recreation. Membership: 195,253 in 6,030 local chapters of 47 States, Hawaii, and Puerto Rico. President: J. Glyndon Stuff. National Executive Secretary: A. W. Tenney. Headquarters: U. S. Office of Education, Washington 25, D. C. During 1945, Star Farmer of America was Gordon John Eichhorn, Marion, Ohio. Champion public speaker was David Elk, Eden, New York. Gold emblem chapters were Talbotton-Woodland, Georgia; Byron, Illinois; Chenoa, Illinois; Lafayette-Bryan Station, Kentucky; Alma, Michigan; Flathead, Montana; Neligh, Nebraska; Shawnee, Oklahoma; Albany, Oregon; Alpine, Texas; Hurricane, West Virginia; and Unida, West Virginia. The National Convention for 1946 was scheduled for October in Kansas City, Mo.

Garden Club of America, founded in 1913. Membership: about 8,000. Corresponding Secretary: Mrs. Henry C. Taylor. Headquarters: 598 Madison Avenue, New York City 22.

Gas Association, American, founded in 1918 by holding companies, service companies, gas operating companies, manufacturers of gas appliances and equipment, and individuals. Membership: 5,000. President: E. J. Boothby. Managing Director: H. Carl Wolf. Secretary: Kurwin R. Boyes. Headquarters: 420 Lexington Avenue, New York City 17.

Geographic Society, The National, founded in 1888 for the increase and diffusion of geographic knowledge. Membership: 1,300,000. President: Gilbert Grosvenor. Vice President: John Oliver La Gorce. Secretary: Thomas W. McKnew. Treasurer: Robert V. Fleming. Headquarters: 1146 Sixteenth Street, N. W., Washington 6, D. C. In fulfilling its aim to diffuse geographic knowledge the Society relies chiefly on its official publication, the monthly illustrated *National Geographic Magazine*, which is sent to every member. During 1945 the Society continued its study of North American birds in their Canadian nesting areas under the leadership of Dr. Arthur A. Allen. The investigations were carried out along the north shore of the Gulf of St. Lawrence (Quebec Province) and on nearby islands which have been set apart as bird sanctuaries. Natural color photographs were made of auks, murrelets, puffins, cormorants, eiders and Red-Throated Loons. The seventh archeological expedition of the Society and the Smithsonian Institution to southern Mexico worked during 1945 in the highlands of the State of Chiapas near Tuxtla Gutierrez. Under the leadership of Dr. Matthew W. Stirling the party excavated eight mounds, uncovering a temple and burial urns containing bones of sacrificed infants. Work toward the solution of problems of the aurora, under study in recent years by the Society and Cornell University, was continued during the year and directed by Dr. C. W. Gartlein. Automatic photoelectric recording instruments were developed and used for the first time to obtain information about auroral displays hidden from the eyes of observers by heavy clouds. Four 10-color wall maps issued as supplements to the *National Geographic Magazine* were prepared during 1945. A map of the Northeastern United States containing the greatest number of place names to appear on any chart published by the Society (10,437) covered the area in North America supporting the heaviest population and embracing the greatest factory activity. It included a portion of southeastern Canada. Three other similar wall maps charted areas of special significance in the closing days of World War II: the Philippine Islands, China, and Japan and Korea. Franklin L. Burr prizes were awarded by the Society to Dr. Lyman J. Briggs for outstanding work in directing field expeditions; and to Dr. Thomas A. Jagger for developing the first "duck" or amphibian mobile boat in 1927—a combination beach automobile and boat used in explorations near Pavlov Volcano in Alaska. The *Geographic News Bulletins* supplying background information about places and regions appearing in the news, especially in regard to postwar changes and adjustments, were distributed to more than 500 daily newspapers and approximately 200 radio stations. A series of feature stories with maps describing disputed areas in Europe was also furnished to 175 Sunday newspapers. *Geographic School Bulletins* embodying material similar to that in the *News Bulletins* were supplied weekly to more than 35,000 classrooms.

Geographical Society, American, a research institution founded in 1852. Membership: 4,766. President: Roland L. Redmond. Director: John K. Wright. Headquarters: Broadway at 156 Street, New York City. Most recent publications of the Society are: *Japan: A Geographical View* by Guy-Harold Smith and Dorothy Good with the collaboration of Shannon McCune; *Pioneer Settlement in the Asiatic Tropics: Studies in Land Utilization and Agricultural Colonization* by Karl J. Pelzer; the 107th and last sheet of the *Map of Hispanic America*, 1:1,000,000 was issued this year. See Cartography.

Gileads, The International (The Christian Commercial Men's Association of America), founded in 1899 to advance the placing of Bibles in hotels, hospitals, penal institutions, and public schools and has already placed two and a half million Bibles. Membership: about 16,500. President: Rev. H. Muller. Secretary: Nellie F. Dewar. Head-

quarters: 202 South State Street, Chicago. The organization has distributed nearly 9½ million Testaments to the armed forces.

Girl Scouts, Inc., founded in 1912 to help girls develop as good citizens and resourceful people through group self-government and activities in the following fields: homemaking, arts, and crafts, nature, the out-of-doors, literature and dramatics, community life, international friendship, sports and games, health and safety, music and dancing, and vocational exploration. Membership: 1,178,507. President: Mrs. Alan H. Means. National Director: Mrs. Paul Rittenhouse. Headquarters: 155 East 44th Street, New York 17. N. Y. Girl Scout Anniversary Week was celebrated Mar. 12-18, and Girl Scout Week, Oct. 28 to Nov. 8, 1945. Not only in the United States but around the world, war brought increased membership to the Girl Scouts. In spite of being banned in occupied countries, Scout membership doubled and Scouts paraded in Paris and Athens soon after liberation. From Sept. 8, 1944, to Aug. 31, 1945, Girl Scouts of the United States contributed \$63,508.03 to the Juliette Low World Friendship Fund to aid young people abroad and to finance training sessions for leaders from Europe, Asia, and the Americas. All Girl Scouts of the United States had an opportunity to help make the national plan of work and recommended more study of their own communities and intensive work for world understanding. The plan was presented to Mrs. Harry S. Truman, Girl Scout honorary president on Oct. 29, Citizenship Day in Girl Scout Week. Girl Scouts carried their projects in the growing and conservation of food a step further by inviting other youth agencies to join with them in observing a national Share the Food Day to call the nation's attention to the food needs of liberated countries. Mrs. Franklin D. Roosevelt was chairman of the national committee with the joint sponsorship of Girl Scouts, Girl Reserves, Camp Fire Girls, National Federation of Settlements, and National Jewish Welfare Board. Girl Scouts continued to meet the need for many projects such as aid to day nurseries, service to hospitals, and community wide planning boards made up of young people. Wing Scouting continued its expansion by accepting the first of three Piper Cub training planes to be presented annually.

Grange, The National, an Order formed in 1867 to give to the American farmer better social and educational opportunities, economic betterment, and higher spiritual and patriotic idealism; active in cooperative work and in State and National Legislation. Membership: 800,000 in 8,000 subordinate Granges. Master Albert S. Goss. Secretary Harry A. Caton. Headquarters: 744 Jackson Place, N. W., Washington 6, D. C.

Hadassah (The Women's Zionist Organization of America, Inc.) founded in 1912 to foster Zionist ideals in America and to conduct hospitalization, public health, child welfare, land reclamation and youth refugee work in Palestine. Official American representative of Youth Aliyah Movement. Senior membership, 165,000; Junior, 25,000. President, Mrs. Moses P. Epstein, Executive Secretary, Miss J. N. Leibel. Headquarters, 1819 Broadway, New York. During the war Hadassah Medical Center, Mt. Scopus, Jerusalem, was headquarters for wide cooperation program with Allied and American medical authorities. Organization conducts program for democratic action through education among its members in this country. A 250 bed tuberculosis hospital and an undergraduate medical school (joint sponsorship by Hadassah and the American Friends of the Hebrew University) are the newest projects. In addition to the Medical Center, the group runs 50 child welfare stations, 35 playgrounds, feeds 30,000 children daily, conducts the Louis D. Brandeis Vocational Center and provides funds for education and maintenance of Youth Aliyah children. Newest land project is a village for returning soldiers in Palestine.

Health Council, National, founded in 1921 to consolidate and correlate the activities of the member agencies and other activities for the betterment of health. Membership: 21 member agencies. President: Eleanor Brown Merrill. Secretary: Prof. Maurice A. Bigelow. Headquarters: 1790 Broadway, New York, N. Y. The annual meeting is held in January or February of each year. The outstanding activity of 1945 was the publishing of the Gunn-Platt Report of the Study of Voluntary Health Agencies, in conjunction with the Rockefeller Foundation.

Henry George School of Social Science, founded in 1898 to teach fundamental economics and social philosophy. Hundreds of volunteer instructors throughout the country. Classes (no tuition charge) are held at headquarters, in public buildings, YMCA's, churches, homes, offices, etc. Free correspondence courses offered to students throughout the world. Director: Margaret E. Bateman. Headquarters: 50 East 69th Street, New York City 21.

Hispanic Society of America, The, founded in 1904 as a free public museum and library devoted to Spanish and Portuguese art and literature. The collections include paintings, sculpture, ceramics, metalwork, furniture, textiles, incunabula, illuminated manuscripts, and other works of art. Membership in the Society, which is limited to 100 Members and 800 Corresponding Members, is honorary and includes specialists and scholars distinguished in the Hispanic field. President: Archer M.

Huntington, Secretary: Herbert E. Ives. **Headquarters:** Broadway, between 155th and 156th Streets, New York City. The Society has issued about six hundred volumes relating to Spanish art, history, and literature.

Historical Association, American, founded in 1884 to promote historical studies, the collection and preservation of historical manuscripts, etc. **Membership:** 8,600. **President:** Sidney B. Fay. **Executive Secretary:** Guy Stanton Ford. **Headquarters:** Study Room 274, Library of Congress Annex, Washington 25, D.C. The annual meeting in 1945 was held in Washington on December 27th.

Home Economics Association, American, organized in 1908 for development and promotion of standards of home and family life. **Membership:** over 15,000 individuals, 814 college clubs, and 11 groups of homemakers. **President:** Mrs. Dora S. Lewis. **Executive Secretary:** Lella Massey. **Headquarters:** 620 Mills Building, Washington 6, D.C. The 1945-46 program of work: Fifty Association officers and committee chairmen met for a week in June, 1945, to plan ways in which the program could be carried out. Conditions made it essential to mobilize the entire membership of the Association on certain critical problems of families. The Association in April, 1945, made a nation-wide survey on the situation in relation to low-priced clothing. Another nation-wide project, "The Consumer Speaks," is being continued in 1945-46. The purpose of this project is to offer consumers an opportunity to cooperate with forward-looking businessmen in improving postwar markets. The apprentice training committee has established requirements for training in industrial food service. Seven international fellowships were awarded to young women from Brazil, China (2), Dominican Republic, and India (3) for 1945-46. The Borden Award was granted to Bertha Burke for outstanding work in nutrition in 1944-45. The Association's Ellen H. Richards research fellowship for 1945-46 went to Dorothy Husseman, University of Illinois. An annual meeting will be held in Cleveland, Ohio the week of June 23, 1946.

Hospital Association, American, founded in 1899 to promote the welfare of the people through the development and extension of hospital care. Serving 3,600 hospitals and 2,900 hospital representatives in the United States and Canada through an exchange of educational materials and technical information. **President:** Peter D. Ward, M.D. **Treasurer:** Harley A. Haynes, M.D. **Executive Director:** George Bugbee. **Headquarters:** 18 East Division Street, Chicago 10. Seven professional and administrative counseling bodies compile and disseminate information to those interested in the public health and welfare. Bacon Library in Association headquarters is the largest library in the world devoted to hospital literature. The Hospital Service Plan Commission, comprised of 85 Blue Cross prepayment hospital-care plans and 33 affiliated medical care plans, serves 20 million participants throughout the country. The Commission on Hospital Care, a nongovernment public service analysis of health facilities in this country, was inaugurated in 1944.

Humane Association, the American, founded in 1877 for the prevention of cruelty to children and animals. **Membership:** 11,000. **President:** Robert F. Sellar. **General Manager:** Walter J. Dethloff, 135 Washington Avenue, Albany, N.Y.

Industrial Conference Board, Inc., The National, founded in 1916 for scientific research, professional education; practical service, and public information in the field of business economics and business management. **President:** Dr. Virgil Jordan. **Secretary:** Leonard E. Read. **Headquarters:** 247 Park Avenue, New York City.

Industrial Council, National, founded in 1907 to provide state and local industrial and manufacturing trade associations with a forum for discussion of industrial and associational problems and programs. **Membership:** 290 associations. **Chairman:** Ira Mosher. **Executive Director:** T. M. Brennan. **Headquarters:** 14 West 49th Street, New York 20, New York.

Industrial Democracy, League for, founded in 1905 with the purpose of education for increasing democracy in our economic, political, and cultural life. **Membership:** 2,000. **President:** Mark Starr. **Executive Director:** Harry W. Laidler. **Headquarters:** 112 East 19 Street, New York City. Conferences held in 1945 celebrated 40th anniversary of I.I.D.; radio broadcasts, lectures, research, pamphlets on postwar reconstruction, debts, taxation, American and British labor movements, etc.

Industrial Organizations, Congress of (CIO), founded in November, 1935, to bring about the effective organization of the working men and women of America, regardless of race, creed, color, or nationality, and to unite them for common action into labor unions for their mutual aid and protection. **Claimed membership:** 6,000,000. **President:** Philip Murray. **Secretary-Treasurer:** James B. Carey. **Headquarters:** 718 Jackson Place, Washington, D.C. The Congress achieved an outstanding record during the war in all basic war production industries, with CIO workers mainly responsible for a 400 percent increase in production. Served in a consultative capacity to the United Nations Conference for International Organization. Instrumental in forming World Federation of Trade Unions, of which it is a member.

Industrial Relations Counselors, Inc., established in 1926 to advance the knowledge and practice of human relationships in industry, commerce, education, and government. **Director:** T. H. A. Tiedemann. **Headquarters:** 1270 Sixth Avenue, New York 20, New York. The organization conducts research, offers a consulting service, mainly for industrial corporations, and maintains a specialized industrial-relations library and an information service. Fifteen volumes and ten monographs had been published by the close of 1945.

Industrial Research Institute, Inc., was founded under the auspices of National Research Council in February, 1938, (incorporated 1945) to promote, through the cooperative efforts of its members, improved, more economical and more effective techniques of organization, administration and operation of industrial research; to develop and disseminate information as to the organization, administration and operation of industrial research; to stimulate and develop an understanding of research as a force in the economic, industrial and social activity of the nation; and to promote high standards in the field of industrial research. A comprehensive monograph on the management of industrial research written by members of the Institute is to be published in 1946. Book to be authoritative reference work for men administering research and a suitable textbook for graduate courses in universities. **Membership:** 76 companies. **President:** J. M. McIlvain. **Secretary:** C. G. Worthington. **Headquarters:** 60 East 42nd St., New York City. Meetings in 1945. Chicago and New York City. February 1946 meeting scheduled for Columbus.

Information Bureau, Inc., National, a nonprofit membership corporation which analyzes national and international charitable organizations for the advice and protection of contributors and philanthropic agencies, founded in 1918. **Chairman:** Allen Wardwell. **Executive Director:** D. Paul Reed. **Headquarters:** 205 East 42 Street, New York City 17.

International Education, Institute of, a nonmembership organization, founded in 1919 to increase international understanding through interchange of students, arranging tours for foreign lecturers, teacher and librarian exchanges, and publication of books, pamphlets and a News Bulletin. The Institute serves as a general clearinghouse of information in its field. **Director:** Stephen Duggan. **Assistant Director:** Edgar J. Fisher. **Headquarters:** 2 West 45th Street, New York, New York. For the academic year 1945-46, 545 fellowships and scholarships were awarded for study at United States colleges and universities. With the end of World War II it is expected that the European student exchanges under the auspices of the Institute of International Education can be resumed within another academic year. The Institute's work in the field of Inter-American cultural relations has continued to expand as in the years since 1939. Increased assistance has also been rendered to displaced foreign scholars and to refugee and stranded students. About 95 State Department fellowships have been arranged for Chinese students during the past year through a two-man committee composed of the Directors of the Institute of International Education and the China Institute of America.

Investment Bankers Association of America, organized in 1912 to serve investment bankers through mutual cooperation, maintenance of high standards of service, self-regulation, and support of appropriate legislation. **Membership:** 691 Main office, 705 Branch office. **Alden H. Little**, Executive Secretary and Treasurer. **Headquarters:** 83 South Clark Street, Chicago.

Iron and Steel Institute, American, founded in 1908 to promote the interests of the industry. **Membership:** about 1,800. **President:** Walter S. Tower. **Secretary:** G. S. Rose. **Headquarters:** 350 Fifth Avenue, New York City.

Italian-American Labor Council, founded in December, 1941, to coordinate all activities upholding democratic principles in the fight against fascism and in harmony with the fundamental elements and objectives of labor unionism; to extend assistance to Italian political refugees, victims of fascist reaction; add to integrate moral and financial Italian-American forces and lead them toward the goal of victory. **Membership:** 250,000. **President:** Luigi Antonini. **Secretary:** Joseph D. Procopio. **Executive Director:** Vincent Bello. **Headquarters:** 202 West 40 Street, New York, N.Y. At the 1945 Columbus Day Celebration the 4-Freedoms Award was given to General Mark W. Clark. At this celebration, a Drive to collect funds for an orphanage in Rome was also inaugurated. Donations of clothing were given to 500 soldiers of the Italian Unit Service and their families, large supplies of powdered milk and medical and surgical articles were sent to the needy in Italy, and funds were furnished to help reestablish democratic forces in Italy for the creation of a democratic state in that country.

Jewish Women, National Council of, founded in Chicago in 1898, carries on a program of service to the foreign born and of education and action in social legislation, social welfare and war activities, international relations and peace, and contemporary Jewish affairs. **Membership:** 65,000 in 215 senior, 72 junior, and 88 councilite sections throughout the United States and Canada. **President:** Mrs. Joseph M. Weit. **Recording Secretary:** Mrs.

Mortimer Brenner. Executive Director: Mrs. Anna K. Schwartz. Headquarters: 1819 Broadway, New York 23, N. Y. During 1945, in addition to its traditional long-range social and educational activities, the Council assisted in various national wartime and governmental programs, through disseminating information and by membership action. As a member of the American Council of Voluntary Agencies for Overseas Relief, the Council was asked by the United States Relief and Rehabilitation Administration to act as coordinating agency for the Jewish community in the Emergency Clothing Collection for Europe, made by the synagogues and churches of America. The Council, at the request of the Government, assisted in social welfare work and in supplying supplementary needs for the refugees at the Emergency Refugee Shelter, Oswego, N.Y. The Council is a member and was active in the organization of the Central Location Index, established last year to cooperate in the location of relatives and reuniting of war-dispersed families of Europe, work similar to that begun by the Council as part of its overseas reconstruction program after World War I.

Joint Distribution Committee, Inc., The American Jewish (J.D.C.), founded during the first World War to give emergency and reconstruction aid to needy Jews overseas. Membership: 7,147 in the National Council. Chairman: Edward M. M. Warburg. Executive Vice-Chairman: Joseph C. Hyman. Secretary: Moses A. Leavitt. Headquarters: 270 Madison Avenue, New York City. During 1945 J.D.C. spent a total of \$27,880,000 to provide these services to hundreds of thousands of persons; food, shelter, clothing, medical aid and child care, emigration assistance, vocational training, cultural and educational help, resettlement and economic aid. During that period 8,500 persons were enabled to emigrate from Europe to Palestine, in addition to which several hundred were helped to other havens of safety.

After Pearl Harbor, local committees affiliated with the J.D.C. in enemy-occupied countries continued essential relief programs by borrowing money, food and commodities locally on the basis of a J.D.C. promise to repay the loans thus incurred when possible without aiding the enemy. J.D.C. work on behalf of native and refugee Jews goes on in all of Europe, Algeria, French Morocco, Tunisia, Tangier, Turkey, Iran, Shanghai, Palestine, and other areas. It is shipping food and clothing packages to refugee Jews in Soviet Asia from supply points in Palestine and Iran. During 1944 and 1945 it rescued thousands of refugees with the help of the War Refugee Board and other agencies, transporting them to other countries and sustaining them there. Its major program outside Europe is in Latin America, where there are 125,000 immigrants whom J.D.C. programs of relief and rehabilitation have helped to fit into their new lives.

A large portion of J.D.C. funds are being spent in behalf of Europe's Jewish children. J.D.C. entirely or partially supports more than 30,000 orphans or displaced children in France, Holland, Belgium, Poland, Greece, and Italy alone. The J.D.C. cooperates closely with major private and governmental relief bodies including the War Refugee Board, United Nations Relief and Rehabilitation Administration, Inter-governmental Committee on Refugees, and International Red Cross.

Junior Leagues of America, Inc., Association of the, founded in 1921, to unite the 158 Junior Leagues and through them educate their members for effective volunteer service in community agencies and for shaping welfare and cultural programs. Membership: 42,000. President: Miss Cecil Lester Jones. Executive Secretary: Mrs. C.H.L. Pennock. Headquarters: Hotel Waldorf-Astoria, New York, New York.

Just and Durable Peace, Commission on a, formed in December, 1940, to clarify the mind of Christian churches regarding the moral, political, and economic foundations of an enduring peace. Membership: 100. Chairman: John Foster Dulles. Secretaries: Drs. Walter W. Van Kirk and Richard M. Fagley. Headquarters: 297 Fourth Avenue, New York City 10. Activities in 1944 included publication of a bi-monthly bulletin, *Post War World*, continuation of the program of education in the Churches, and convening of the Second National Study Conference on a Just and Durable Peace held at Cleveland, Ohio, Jan. 16-18, 1945.

Kindergarten Association, National, founded in 1909 to help secure the advantages of kindergarten education for all the nation's children. Membership varies from 2,245 to 8,000. President: Maj. Bradley Martin. Executive Secretary: Bessie Locke. Headquarters: 8 West 40th Street, New York City 18. The Association has given advice to many who wished to have a class opened in their public school, has furnished many hundred thousands of free leaflets on kindergarten values and has loaned prepared programs and the film: *A Day in the Kindergarten*. In 1945, special effort was put forth to arouse, among leaders of state organizations, an interest that would culminate in securing the enactment of better kindergarten legislation. Improved laws were passed in 6 states. As a result of other work done by the Association in 1945, 1580 children have been enrolled in new kindergartens, bringing the total since 1909 to over 1,282,800 children. Weekly Home Education articles

dealing with child behavior problems are furnished free to the press and to Home Demonstration agents; present combined circulation is over 83,214,000. The radio has been used with increasing benefit.

King's Daughters and Sons, International Order of the, (1886) 144 East 87th Street, New York 16, N.Y. Miss Kate O. Hall, Executive Secretary.

Membership: individual, approximately 60,000; Circles, Unit organization, approximately 2,500.

Purpose and Activities: To develop spiritual life and stimulate Christian activities. The Order maintains homes for the aged, for children, summer camps, hospitals and other welfare institutions. It carries on educational activities. Periodicals: *The Silver Cross*, monthly, except July and August. Price \$1.00 per year.

Expansion Educational program thru Summer School under direction N.Y.U. college credits thru Scholarships from Branches

Kiwanis International, founded at Detroit in 1915 to develop a closer relationship between leaders of business, industry, the professions and agriculture, and for civic, social and welfare service to their respective communities. Membership: 154,000 in 2,330 clubs throughout the United States and Canada. President: Hamilton Holt, Macon, Ga. Secretary: O. E. Peterson, Chicago, Ill. General Office: 520 North Michigan Ave., Chicago 11, Ill. Club activities include participation in public affairs, service to underprivileged children, work among boys and girls, fostering closer rural-urban relationships, support of churches in their spiritual aims, promotion of soil conservation, encouragement of better business standards, assistance to returning veterans and aid in postwar reconversion. The motto of Kiwanis is "We Build," while the 1946 theme is "Build for Peace—Unity—Opportunity." The 1946 Victory Convention will be held at Atlantic City, June 9 to 13.

Knights of Columbus, a fraternal benefit society founded in 1882. Membership: 540,000. Supreme Knight: John E. Swift. Supreme Secretary: Joseph F. Lamb. Headquarters: 45 Wall Street, New Haven, Conn.

Knights of Pythias, a fraternal organization founded in 1864. Membership: 300,000. Supreme Chancellor: Chas. J. Schuck, Wheeling, W.Va. Supreme Keeper of Records & Seal: M. M. Ewen, 1054 Midland Bank Building, Minneapolis, Minn. The Supreme Lodge meets biennially, the next meeting to be in August, 1946.

Labor, American Federation of (A.F.L.), founded Nov. 15, 1881, as an organization of wage earners into trade unions and groups of unions for the advancement of their economic interests. Claimed membership: 6,938,000. President: William Green. Secretary-Treasurer: George Meany. Headquarters: A.F.L. Building, 901 Massachusetts Ave., N.W., Washington 1, D.C. The annual convention was held in New Orleans, La. Nov. 20-30, 1944. The 1946 convention is scheduled to open on the first Monday in October, in Chicago, Ill. No convention was held in 1945.

Law Institute, The American, founded in 1923 to promote the clarification and simplification of the law and its better adaption to social needs, to secure the better administration of justice, and to encourage and carry on scholarly and scientific legal work. Membership: 850. President: George Wharton Pepper. Director: William Draper Lewis. Headquarters: 3400 Chestnut Street, Philadelphia.

Learned Societies, American Council of, founded in 1919 to promote the advancement of the humanistic sciences. Membership: 48 delegates (two from each of 24 constituent societies). Chairman: Fred N. Robinson. Director: Waldo G. Leland. Secretary-Treasurer: S. Whitmore Boggs. Headquarters: 1219 Sixteenth Street, N.W., Washington 6, D.C. Next annual meeting to be during last week in January, 1946, at the Westchester Country Club, Rye, N. Y.

Legal Aid Organizations, National Association of, founded in 1921 as a central body representing organizations engaged in rendering legal aid service to promote the work and to cooperate with the judiciary, the bar, and all organizations interested in the administration of justice. Membership: 58 organizations. Honorary President: Hon. Harlan F. Stone. President: Louis Fabricant. Secretary: Emory A. Brownell. Headquarters: 255 Exchange Street, Rochester 4, N. Y. Emphasis of the work in 1945 has been on providing legal aid in home communities to servicemen and returning veterans. Member organizations are designated by the Army, Navy and the Selective Service System to implement their legal assistance offices at military establishments. Over 44,000 cases handled for servicemen and dependents during 1944. Publications include *Committee Reports and Proceedings*, *Annual Directory* and the *NALAO Brief Case*.

Legion of Decency, National, founded in 1934 to review and evaluate morally current entertainment feature motion pictures and to encourage wholesome standards of morality and decency in the cinema. The Motion Picture Department of the International Federation of Catholic Alumnae is the reviewing group for the Legion of Decency. Membership of the Episcopal Committee on Motion Pictures: 5. Executive Secretary: The Very Rev. Monsignor John J. McClafferty. Assistant Executive Secretary: The Rev. Brendan Larnen, O.P. Chairman, Motion Pic-

ture Department, I.F.O.A.: Mrs. James F. Loomam. Headquarters: 35 East 51st Street, New York City 22.

Library Association, American (A.L.A.), founded in 1876 to provide complete and adequate library coverage for the United States and Canada. Membership: 15,000. President: Ralph A. Ulveling. Executive Secretary: Carl H. Milam. Headquarters: 520 N. Michigan Avenue, Chicago. International Relations Office: Library of Congress Annex, Washington, D. C. Harry M. Lydenberg, director. National Relations Office, 1709 M St., N. W., Washington, D. C., Paul Howard, director. Major event of the year was the establishment in October of the National Relations Office, supported by volunteer contributions of librarians to "advance and protect the interests of libraries, and of people who use libraries, in so far as those interests may be helped or hurt by legislation, regulation or other government action." Recommendations for postwar planning for all types of libraries have been developed, and estimates of national library needs are under way. American Libraries in Mexico City, Managua and Montevideo continue to function under A.L.A. administration. Government and foundation support for the Association's national activities amounted to \$895,000 for 1944-45. No conferences were held until ODT regulations relaxed, but a limited conference was held in Chicago Dec. 27-28, and full-scale national conference is scheduled for Buffalo, N. Y., June 16-22, 1946. The Newbery Medal for 1945 went to Robert Lawson for *Rabbit Hill*; the Caldecott Medal to Elizabeth Orton Jones for *Prayer for a Child*.

Library Association, The, founded in 1877 (incorporated by Royal Charter in 1898) to unite all persons engaged or interested in libraries, hold examinations and maintain a professional register, promote the establishment of public libraries, encourage bibliographical study, publish journals, and hold conferences. Membership: 6,500. President: H. M. Cashmore. Secretary: P. S. J. Welsford. Headquarters: Chaucer House, Malet Place, London, W C 1. The Association's Carnegie Medal for an outstanding children's book published in Great Britain during 1944 was awarded to Eric Linklater for *The Wind on the Moon*.

Lions Clubs, International Association of, founded in 1917 as an international association of Lions Clubs, composed of business and professional men interested in the development of their communities. Membership: 240,000 in 5,000 clubs located in 15 countries, namely, British Honduras, Canada, China, Colombia, Costa Rica, Cuba, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Peru, the United States and Venezuela. President: Ramiro Collazo. Secretary-General: Melvin Jones. Headquarters: 332 S. Michigan Avenue, Chicago. Their activities have eight classifications: boys and girls, citizenship and patriotism, civic improvements, community betterment, education, health and welfare, safety, sight conservation and blind. From May 1, 1944, to Apr. 30, 1945, 74,869 separate activities were reported by Lions Clubs. The official publication of the organization is the *Lion Magazine*, issued monthly.

Little Business Men's League of America, founded in 1938 to unite the interests of small business men. President, William Castleman; Secretary, Joseph R. Conkey. Headquarters, 619 North State Street, Chicago 10. Publishers of *The Little Businessman*, *The Voice of Small Business*. The League's 1945-46 program is as follows: To secure legislation from government to reduce taxes, so that small business can expand and modernize and be able to create more jobs.

Management Association, Inc., American, founded by a merger of predecessor organizations in 1923 to provide executives of commercial and industrial companies with a means of exchanging information on management policies and techniques. Held 18 conferences and issued 103 separate publications in 1945. Membership: 7,700. President: Alvin E. Dodd. Chairman of the Board: William L. Batt. Secretary: Henry J. Howlett. Editor: James O. Rice. Headquarters: 330 West 42 Street, New York 18, N. Y.

Manufacturers, The National Association of (N.A.M.), celebrated its 50th anniversary Jan. 22, 1945. Today the National Association of Manufacturers has more than 14,000 active members and approximately 1,200 associate members. Affiliated with the association is the National Industrial Council, a federation of some 300 national, State, and local associations of employers. The association is governed by a board of directors of 150 members which meets nine times a year. Fifteen hundred executives representing industries, large and small, in all parts of the United States, serve on standing committees and special committees of the association and meet time and again throughout the year to reconcile geographical and industrial differences on every subject of general interest to industry. Once every four years, when national presidential elections are held, the association presents to the major political parties organized industry's recommendations as to the principles required for solution of major national problems. In December of each year is held the Congress of American Industry, bringing together several thousand manufacturers for conference upon major national and industrial problems and for discussion of their own major responsibilities and opportunities. Besides this annual Congress of American Industry, the association

each year holds numerous regional meetings in different parts of the United States, for the purpose of bringing together its members in different sections. The association has been and is actively engaged in studying problems connected with the prevention or control of inflation, the termination of war contracts, the postwar use to be made of war plants, the postwar disposal of surplus government-owned equipment and supplies, the termination of war controls, and the resumption of civilian production. Besides its active interest in these problems of the transition period between war and real peace, the association is also vitally interested in the longer range problems. In advancing the interests of its members, the association operates through six departments. It has a Taxation Department which is operated in connection with tax committees. The Industrial Relations Department operates through committees on industrial-relations policy; labor legislation; supervisory relations, etc. The Economic Security Department deals with problems involved in the national Social Security Act. The Public Relations Department handles the public-relations phases of the association's work. The Research Department supplies information for all of the association's committees, departments, and officers, and makes special studies of many important problems. The Law Department serves primarily as a legal adviser to the association, its officers, committees, and board of directors. Through its *Law Digest* and other publications, the Law Department gives to members a review and analysis of new laws, regulations, and decisions affecting industry. One of the most important functions of the National Association of Manufacturers is its service as industry's interpreter to the public. It has, for example, committees promoting cooperation with farmers, with clergymen, with educators, and with leaders of women's clubs throughout the country, endeavoring thus to bring about a greater understanding of industrial problems and viewpoints. To reach the public the association uses every available medium—radio, newspapers, motion pictures, advertising, and booklets. The headquarters of this association is located in New York City; it also maintains offices in Washington, San Francisco and Los Angeles, in addition, Regional Offices are maintained in the following cities: Chicago, Illinois; Dallas, Texas; Denver, Colorado, Atlanta, Georgia; St. Louis, Missouri; Philadelphia, Pa.; Portland, Oregon; and Seattle, Washington.

The NAM officers for the year 1946 are: Chairman of Executive Committee: Robert M. Gaylord. Chairman of the Board: Ira Mosher. President: Robert R. Wason. Executive Vice-President: Walter B. Weisenburger. Secretary: Noel Sargent. Treasurer: Kenneth R. Miller.

Mathematical Society, American, founded in 1888 for the promotion and publication of research in mathematics. Membership: 2,800. President: T. H. Hildebrandt. Secretary: J. R. Kline. Headquarters: Low Memorial Library, Columbia University, New York City. Due to the regulations of the Office of Defense Transportation, meetings for 1945 were confined mainly to the Summer and Annual Meetings. A full roster of meetings is planned for 1946. A Policy Committee is being organized to study problems which will confront mathematics in its relation to other sciences and national welfare during the postwar period. Meetings already scheduled for 1946 are: New York in February, April, and October; Chicago in April, Berkeley, California, in April, Summer Meeting at Cornell University.

Mayors, United States Conference of, founded in 1932 as a clearinghouse for American cities on problems of municipal government. Membership: 250 cities over 50,000 in population. President: Mayor Edward J. Kelly. Executive Director: Paul V. Betters. Headquarters: 730 Jackson Place, Washington, D. C.

Mechanical Engineers, The American Society of, founded in 1880 to promote mechanical engineering and allied arts and sciences. Membership: 19,819. President: D. Robert Yarnall. Headquarters: 29 West 39 Street, New York 18, N. Y. The Society participated in the war production program through public meetings, committee service in research and standardization, and the assembly of records of individual members available for positions in the war effort. At the annual meeting, New York, Nov. 26-30, 1945, the A.S.M.E. Medal was awarded to William F. Durand; the Holley Medal to Sanford A. Moss; the Warner Medal to Joseph M. Juran; the Melville Medal to William J. King; the Junior Award to Bruce E. Del Mar; the Main Award to Jack Drandell, and the Undergraduate Student Award to John W. Erickson. Meetings are scheduled to be held in Chattanooga, Tenn., Apr. 1-8, 1946 (spring meeting); Detroit, Mich., June 17-20, 1946 (semi-annual meeting); Boston, Mass., Sept. 30-Oct. 2, 1946 (fall meeting); New York, N.Y., Dec. 2-6, 1946 (annual meeting).

Mediaeval Academy of America, founded in 1925 to conduct, encourage, and support research, publication, and instruction in mediaeval record, languages, literature, arts, archaeology, history, philosophy, science, and all other aspects of mediaeval civilization. Membership: 1,050. President: George R. Coffman. Executive Secretary: Charles R. D. Miller. Headquarters: 1480 Massachusetts Avenue, Cambridge 38, Mass. The Haskins Medal, offered

annually for a distinguished publication in the field of mediaeval studies, was awarded in 1945 to George Edward Woodbine for his edition of *Bracton de Legibus et Consuetudinibus Regni Angliæ*. Three volumes concerned with the Middle Ages were published in 1945. *Speculum*, the journal of the Academy, is published quarterly.

Medical Association, American, founded in 1847 to promote the science and art of medicine and the betterment of public health. Membership: 125,287. President: Roger I. Lee. Secretary and General Manager: Olin West. Headquarters: 535 N. Dearborn Street, Chicago. The Distinguished Service Medal and Citation for distinguished service in the science and art of medicine was awarded December 8, 1945, to Dr. George R. Minot, Boston. The Association will hold a scientific session in San Francisco, July 1-5, 1946.

Medical Association, Canadian, founded in 1867 and interested in all matters concerning the practice of medicine. Membership: 7,000. President: Léon Gérin-Lajoie, M.D., Montreal. General Secretary: T. O. Routley, M.D. Headquarters: 184 College Street, Toronto, Canada.

Mental Hygiene, Inc., The National Committee for, founded in 1909 to promote interest and action throughout the United States in the prevention and control of mental illness and the conservation of mental health. Elected membership: over 700. Medical Director: Dr. George S. Stevenson. Headquarters: 1790 Broadway, New York City 19.

Metals, American Society for, an organization devoted to the promotion of the arts and sciences connected with either the manufacture or the treatment of metals. Membership: 19,912. President: Charles H. Herty, Jr. Secretary: W. H. Eisenman. Headquarters: 7301 Euclid Ave., Cleveland 8, Ohio. The postponed 1945 National Metal Congress and Exposition will be held in Cleveland the week of February 4, 1946.

Meteorological Society, American, founded in 1919 for the advancement and diffusion of knowledge of meteorology (including climatology) and its application to public health, agriculture, engineering, transportation, and other forms of industry and commerce. Membership: about 2,700. Secretary: Charles F. Brooks. Headquarters: Blue Hill Observatory, Milton 86, Mass. The Society publishes the *Bulletin and Journal of Meteorology*.

Mineralogical Society of America, founded in 1920 for the advancement of mineralogy, crystallography, petrology, and allied sciences. Membership: about 1,000. President: K. K. Landes, University of Michigan, Ann Arbor, Michigan. Secretary: C. S. Hurlbut. Headquarters: Harvard University, Cambridge, Mass.

Mining and Metallurgical Engineers, American Institute of, founded in 1871 to promote the arts and sciences connected with the production of useful minerals and metals and the welfare of those employed in these industries. Membership: 13,300. President: Louis S. Cates. Secretary: A. B. Parsons. Headquarters: 29 West 39 Street, New York 18, N. Y. In 1945 the James Douglas Medal was awarded to Robert F. Mehl; the Robert W. Hunt Medal to E. Chester Wright; and the J. E. Johnson, Jr., Award to Carl G. Hogberg.

Mission to Lepers, Inc., American, organized in 1906, incorporated in 1920, to aid and preach the Gospel to people suffering from leprosy and to encourage their segregation, care and medical treatment throughout the world. Membership: 60,000. President: Dr. Wm. Jay Schieffelin. General Secretary: Dr. E. R. Kellersberger. Associate Secretary: Raymond P. Currier. Headquarters: 156 Fifth Avenue, New York City. During 1945 the Mission was again able to reach leprosy colonies in the Philippine Islands and East China, with prospects of soon reaching those in South China, Korea, Thailand, Burma, Japan and Formosa.

Modern Language Association of America (M.L.A.), organized in 1883 to promote literary and linguistic research in all the fields of the Modern Languages and Literatures. Membership: 8,800. President: Fred N. Robinson. Secretary: Percy W. Long. Headquarters: 100 Washington Square, New York City 3.

Moose, Loyal Order of (Supreme Lodge of the World), a fraternal organization founded in 1888. Membership: 607,481. Director-General: Hon. James J. Davis. Supreme Governor: Charles W. Bowers. Supreme Secretary: Malcolm R. Giles. Headquarters: Moosehead III.

Motion Picture Producers and Distributors of America, Inc., organized in 1922 to foster the common interest of those engaged in motion picture industry. President: Eric A. Johnston. Secretary: Carl E. Milliken. Headquarters: 28 West 44 Street, New York City. The annual meeting was held in New York City in March, 1945.

Municipal Association, American, the national federation of the State Leagues of Municipalities, founded in 1924. It carries on activities designed to assist member leagues in their work of serving and representing their member municipalities. Membership: 41 State Leagues, representing 9,000 cities and towns. President: R. E. Riley, Mayor, Portland, Oregon. Executive Director: Earl D. Mallory. Headquarters: 1213 East 60 Street, Chicago, Ill. The Association provides a consulting service on special phases of municipal government, and keeps its members informed of Federal legislation affecting municipal

government; it represents the interests of municipalities nationally, in much the same way that the State leagues represent municipalities before the State governments.

Municipal League, National, a nonprofit citizen organization founded in 1894 and serving as a national clearinghouse for information on local government improvement and the development of a more enlightened citizenry through the preparation of model laws and administrative systems and cooperation with local civic organizations. Membership: 2,000. President: Hon. John G. Winant. Executive Secretary: Alfred Willoughby. Headquarters: 299 Broadway, New York 7, N. Y. Publications: *National Municipal Review*, published monthly, and various books, pamphlets, and reports. Annual conference on government will be held in 1946 in Philadelphia in observance of 50th anniversary of founding. Special publications in 1945 were: *The County Manager Plan*, *Best Practice Under the Manager Plan*, *Model Cash Basis Budget Law*, and *Model Accrual Budget Law*.

Museums, American Association of, founded in 1906 to help museums solve their problems and increase their usefulness. Membership: 1,100. President: David E. Finley. Director: Laurence Vail Coleman. Headquarters: Smithsonian Institution, Washington, D. C. The Association has two major functions—long range work that shapes broadly the courses of museum development, and direct and immediate usefulness to museums. The former program was advanced during 1945 through a study of museum buildings. A book on this subject is planned as a contribution to the anticipated postwar building of museums in many cities. The Association's program of direct service is being carried forward as usual through serial publications and consulting work. The Association publishes *The Museum News*, a bi-weekly paper devoted to news of the museum world, which completed its 22nd volume in 1945.

Music Clubs, National Federation of, founded in 1898 for the purpose of "bringing into working relation with one another music clubs and other musical organizations and individuals directly or indirectly associated with musical activity for the purpose of aiding and encouraging musical education and developing and maintaining high musical standards throughout America." Membership: about 500,000 members in 5,000 clubs. President: Mrs. Guy Patterson Gannett. Secretary: Mrs. H. Carroll Day. Publications and Business Offices: 113 E. Green Street, Ithaca, New York. The Federation has outfitted all hospital ships bringing home American wounded with records, phonographs, and musical kits. Through a Music in Hospitals program, in which it cooperates with the American Red Cross, it is sending ward music into Army and Navy Hospitals throughout the country and into some Veterans Bureau and Public Health Hospitals as well. It is also providing musical instruments for these hospitals and in most instances keeping them in repair. This work is being continued with the armistice of occupation. Its Biennial Young Artists Auditions, for which four prizes of \$1,000 each are offered, are continuing with the next scheduled for the spring of 1947. Annual Young Composers Contests are held with a top prize of \$150 and several smaller prizes. An intensified American Composition program has been started, a feature of which is the distribution of monthly lists of reviews of all new American works in the serious music field to federated clubs, schools, and libraries. The Federation is making an annual selection of works of American composers which its Orchestras Committee recommends to leading conductors for inclusion in their programs. The Federation publishes the *Music Clubs Magazine* issued bi-monthly September to June.

Music Council, Inc., National, organized April, 1940, to provide a forum for the discussion of problems affecting national musical life, to speak with one voice for music in the United States, to provide for an interchange of musical information, to encourage coordination of effort among musical organizations, to conduct surveys, to encourage the development of music and to foster the highest ethical standards in it. Membership: limited to nationally active musical associations, now numbers 42 such associations, with an individual membership of over 600,000. President: Howard Hanson. Executive Secretary: Edwin Hughes. Headquarters: 838 West 89th Street, New York 24, N. Y. The Council publishes in its *Bulletin* digests of proposed national legislation affecting music, authoritative information on musical activities in the various departments and agencies of the Federal Government, government regulations concerning music, lists of musical contests and competitions, annual surveys of the programs of the major symphony orchestras of the United States, together with other surveys of national musical activities, information as to the use of music in industry, in hospitals, and in various other fields which affect the national music picture, and news of the activities of its member organizations. The Council has assisted the veterans Administration through Music Consultants to work with the officers of the Administration at each of its local offices in advising and assisting returning servicemen who wish to enter the field of music. The Council made the first nation-wide survey of the Use of Music in

Hospitals for Mental and Nervous Diseases, and published a report on this survey. The Council is represented on the Music Advisory Committee of the Division of Cultural Relations in the State Department. The annual meeting is held in May, and general sessions of the Council are called during each year as occasion demands.

National Guard Association of the United States, founded in 1878 to advance the interests of the National Guard, improve its armament, equipment, and training for the greater security of the nation. Membership includes the entire complement of officers of the National Guard in each state and territory, totaling about 250,000. President: Maj. Gen. Ellard A. Walsh, State Capitol, St. Paul, Minn. Secretary: Brig. Gen. Fred M. Waterbury, 70 East 45 Street, New York, N. Y.

Nature Association, American, founded in 1922 to stimulate public interest in every phase of Nature and the out-of-doors, and to further the practical conservation of the great natural resources of America. Membership: 66,000. President: Arthur Newton Pack. Secretary: Richard W. Westwood. Headquarters: 1214 16th Street, N.W., Washington 6, D.C. Official organ of the Association is *Nature Magazine*.

Navy League of the United States, founded in 1902 with the object of acquiring and spreading before the citizens of the United States information as to the condition of the naval forces and equipment of the United States and to awaken interest and cooperation in all matters tending to aid, improve or develop their efficiency. It is non-profit, non-partisan, non-commercial and non-sectional in character. Every civilian who is an American citizen in good standing, and all officers and enlisted personnel of the armed services released or discharged from such service under honorable conditions, are eligible for membership. The basic purpose of the Navy League is to keep the citizens of this country properly informed as to the needs of our Navy in order that it may be constantly and efficiently maintained as the greatest sea-air power in the world, which position it now occupies. The citizens of the United States looking ahead will be satisfied with nothing less, and the Navy League undertakes to keep this objective constantly alive and before the people of our country. The President is Ralph A. Bard and the Secretary is Evelyn M. Collins. Headquarters. The Mills Building, Washington 6, D.C. The Navy League of the United States inaugurated Navy Day in 1922 and has sponsored it annually since that time.

Near East Foundation, an organization founded in February, 1930, for humanitarian and welfare activities in the countries of the Near East. Membership: 50,000. President: Cleveland E. Dodge. Executive Secretary: Edward C. Miller. Headquarters: 17 West 46 Street, New York, N. Y. The Foundation is actively engaged in war relief work in the Near East. From 1940 through September, 1945, it has collected a total of \$2,033,745.60. The beneficiaries of this money will be the unfortunate war victims in Greece, Syria, Cyprus, Iran and Lebanon.

Netherlands-America Foundation, Inc., founded in 1921 to deepen understanding and friendship between the Netherlands and the United States through educational and cultural channels. Membership: 419. Hon. President: Thomas J. Watson. President: Peter Grimm. Secretary: Charles P. Luckey. Executive Secretary: Thomas E. Freeman. Headquarters: 10 Rockefeller Plaza, New York 20, N.Y. The Annual Meeting is held the third Monday in January. The most important project at the present time is to procure scholarships which will enable Dutch students to come to this country and study in our colleges and universities.

New Education Fellowship, The, founded in 1915 to promote the unity of educators throughout the world interested in progressive education. Deputy-Chairman, J. A. Lauwerys, London University; Secretary, Miss Clare Soper, International Headquarters, 1 Park Crescent, London, W. 1, England. During 1945 the Fellowship issued monographs designed to give guidance to those who will work with children suffering from the effects of the war. Monograph 1. Children's Communities; Monograph 2. Fatherless Children; Monograph 3. Play and Mental Health. Price 50 cents each. Monographs on new education plans in the liberated countries are also in preparation. Conferences: August, 1946—a Regional N.E.F. in Paris—also a small conference on "Ethics" in England. Possibly a Scandinavian Conference in Denmark.

Newspaper Publishers Association, American, founded in 1887 to foster and protect the interest of the newspaper publishing business. Membership: 752. President: William G. Chandler. General Manager: Cranston Williams. Headquarters: 870 Lexington Avenue, New York, N.Y. The 1946 meeting will be held in New York City at the Hotel Waldorf-Astoria April 23-25.

Numismatic Society, The American, founded in 1858 for the collection, preservation, and study of coins, medals, and decorations of all countries. Membership: 470. President: Dr. Herbert E. Ives. Secretary and Curator: Sydney P. Noe. Headquarters: Museum at Broadway and 156 Street, New York, N. Y. A loan exhibition by members of choice Greek coins was held in November, 1945. Meetings are held at the Museum on the second Saturday in January, April and November.

Nurses' Association, American, founded in 1896 to promote the professional and educational advancement of nurses, to elevate the standard of nursing education, and to establish and maintain a code of ethics among nurses. Membership: 178,415. President: Katharine J. Densford, R. N. Secretary: Margaret K. Stack, R. N. Headquarters: 1790 Broadway, New York 19, N. Y. During 1945, the American Nurses' Association, working through its constituent State Nurses' Associations, assisted in the procurement of nurses for the military, and created a representative Committee on Nursing Service which will give attention to personnel practices including salaries for nurses. Further, the Association initiated a nation-wide counseling and placement service, one phase of which relates to the counseling of veteran nurses.

Nutrition Foundation, Inc., The, organized in December, 1941, to develop and apply the science of nutrition as a basic science of public health. Membership: 47. Chairman of the Board: Karl T. Compton. President: George A. Sloan. Scientific Director: Charles Glen King. Executive Secretary: Ole Salthus. From May, 1942, when the initial grants were made, to June 30, 1945, the Foundation appropriated \$927,190.00 for 101 studies in the science of nutrition at 44 leading universities and hospitals. The Foundation publishes *Nutrition Reviews*, a monthly journal providing an unbiased review of the world's current research literature in the field of nutrition. The Foundation also publishes *Nutrition*, a Spanish edition of *Nutrition Reviews*, in the interests of medical and public health education in the Spanish-speaking Americas, and in the promotion of cultural relations.

Occupational Therapy Association, American, founded in 1917 to promote the use of occupational therapy and for education, training, research, and other activities advantageous to the profession. Membership 2,300. President: Everett S. Elwood. Treasurer: Holland Hudson. Executive Secretary: Mrs. Meta R. Cobb. Headquarters: 83 West 42nd Street, New York 18, N. Y.

Odd Fellows, Independent Order of, a fraternal organization founded in 1819. Membership: 1,393,160. Grand Sire: D. D. Monroe. Grand Secretary: Edw. G. Ludvigsen. Headquarters: 16 West Chase Street, Baltimore, Md. The 1946 meeting will be held in Birmingham, Alabama.

Oriental Society, American, founded in 1842 for the promotion of research in oriental languages and cultures and the publication of books and papers. Membership: 875. President: E. A. Speiser. Secretary: Ferris J. Stephens, Yale University, New Haven, Conn.

Ort, Women's American, a national organization founded in 1927, as a constituent body of the American Ort Federation, which is part of the World Ort Union, whose purpose is the promotion of technical trades and agriculture among Jewry in vocational and technical trade schools, agricultural colonies, cooperatives and workshops. For over 60 years the Ort has trained the dislocated and the underprivileged to become integrated into the economic scheme of their native lands or in countries of refuge.

During the war Ort functioned in Europe and laid the groundwork for post war economic reconstruction, and now constitutes a part of the rebuilding of liberated Europe. Ort is cooperating with governments of the countries in which it functions. In addition, since the Nazi regime stripped the occupied countries of working tools and all needed equipment, Ort's present work includes supplying tools, machines and raw materials to displaced workers, to reestablish themselves individually or collectively in their former professions. Effective expansion this year resulted in three regional groups—a New York Metropolitan Regional (comprising 22 chapters in Greater New York); a Connecticut Regional and a Mid West Regional. The Guardianship-Vocational Training Plan was also launched in 1945—to partially maintain and train European Jewish war orphans, training them in useful skills, apprenticing them to master craftsmen, thus qualifying them technically to participate in the reconstruction of their countries. Membership approximately 20,000. President: Mrs. Maurice Finkelstein. Headquarters: 212 Fifth Ave., New York 10, N.Y. Events of 1945-46 include the Annual Donor Luncheon at the Hotel Astor May 9th, 1945; the Annual Regional Membership Luncheon at the Hotel Commodore November 28, and the Annual Donor Luncheon at the Hotel Astor May 8th, 1946. Chapter meetings are held monthly in the 49 chapters throughout cities in the United States.

Pacific Relations Institute of, founded in 1925 to promote scientific study and discussion of the problems and inter-relations of the peoples of the Pacific area. Composed of National Councils in several countries bordering on or having interest in the Pacific Ocean. Chairman: Edgar J. Tarr, K. C. Secretary-General: Edward C. Carter. The Chairman of the American Council is Robert Gordon Sproul. Secretary: Raymond Dennett. Headquarters: 1 East 54 Street, New York City 22. Membership: 1,158. Publications: *Studies of the Pacific* (research series); *Far Eastern Survey*, fortnightly; popular pamphlets; basic texts on Far East for school use.

Pan American Foundation, founded in 1938 to promote and maintain, through nongovernmental means and agencies, the principles and policies of Pan Americanism. The

foundation promotes the founding of a Pan American University, and assists and cooperates in the exchange of literary, artistic, musical, scientific, and medicinal accomplishments between the peoples of the Western Hemisphere. Director. A. Curtis Wilgus. Secretary. William A. Reid. Headquarters: 1217 Thirteenth Street, N.W., Washington, D.C.

Pan American Women's Association, founded in 1930 to promote inter-American understanding through cultural interchange. President: Frances R. Grant. Secretary: Jessie Adamson. Headquarters: 45 West 45 Street, New York, N. Y. During 1945 the Association held its panel luncheons on the third Saturday of each month and continued its concerts, exhibitions, and special institutes on inter-American problems.

Peace Conference, National, founded in 1933 with a three-fold purpose: as a council board, as a clearinghouse, as a publishing and service agency to provide nonpartisan information on international affairs. Membership, 36 national organizations. President, John Paul Jones; Administrative Vice President, Jane Evans; Executive Secretary, Marian R. Emerine. Headquarters: 8 West 40 Street, New York N.Y. The Conference holds monthly meetings of organizational leaders to discuss current problems, clarify issues, and plan programs. Recent publications of the Conference include a study pamphlet *Pros and Cons of Peacetime Conservation and Complete Text of the United Nations Charter*.

P.E.N. Club, a world association of writers, founded in 1922 in the interests of literature, freedom of artistic expression, and international good will. Membership (American Center): 335. President. Carl Carmer. Secretary: Whit Burnett. Headquarters: 16 East 96 Street, New York City. The International Federation of the P.E.N. Clubs is headed by a Presidential board, consisting of H. G. Wells, Dr. Hu Shih, Thornton Wilder, and Denis Sauret.

Pen Women, National League of American, founded in 1897 to promote the creative, cultural arts of Pen, Pencil and Brush. Membership: 3,100. Eighty nine Branches. Headquarters, 408-09 Willard Hotel, Washington, D. C. President, Blanche Smith Ferguson. The League holds a Biennial Congress on numerically even years, a Mid-administration Congress on numerically odd years. The League publishes a monthly magazine, *The Pen Woman*, editor, Winifred Willard; also a Membership Roster biennially.

People's Lobby, Inc., The, founded in 1931 (formerly the People's Reconstruction League, founded in 1920) to work for legislative and administrative measures in the interest of all the people. Membership: 3,490. President: Bishop Francis J. McConnell. Executive Secretary: Benjamin Marsh. Headquarters: 1410 H Street, N.W., Washington, D.C. During 1945 the organization distributed about a quarter of a million reprints of its material. It worked for government retention of its war plants to be converted to peace production. It held two conferences and published all addresses as pamphlets.

Petroleum Institute, American, founded in 1919 to afford a means of cooperation with the government, foster trade in petroleum products, promote the interests of the industry, the mutual improvement of its members, and the study of related arts and sciences. Membership, about 4,000. President: W. R. Boyd, Jr. Secretary: Lacey Walker. Headquarters: 50 West 50 Street, New York City.

Philatelic Society, American, an organization of stamp collectors, founded in 1886. Membership 7,000. President: Donald F. Lybarger. Executive Secretary: H. Clay Musser. Central Office, P. O. Box 800, State College, Pa. The annual meeting, held in August, is scheduled for Chicago, Ill., in 1946.

Philological Association, American, founded in 1869 for the advancement and diffusion of philological knowledge; incorporated, 1937. Membership: 1,025. President: G. D. Hadzsis. Secretary: S. B. Smith. Schoolcraft, Michigan.

Philosophical Association, The American, founded in 1900 for the promotion of the study and teaching of philosophy in all branches. Membership: 840. Chairman: George P. Conger, University of Minnesota. Minneapolis, Minn. Secretary-Treasurer: Cornelius Kruse. Headquarters: Wesleyan University, Middletown, Connecticut.

The Sixth Series of Carus Lectures was delivered by Professor Morris R. Cohen on the subject: "The Meaning of Human History" at a special meeting of the American Philosophical Association, held in New York City at the City College of New York on May 17 to 18, 1945.

The Seventh Series of Carus Lectures will be delivered by Professor Clarence Irving Lewis on the subject: "Analysis of Knowledge" at the University of California, at Berkeley, December 27 to 29, 1945. The meeting for the reception of the Carus Lectures at Berkeley is also the first resumed meeting of the American Philosophical Association since the restriction of meetings by the Office of Defense Transportation. It is to be a joint meeting of all three Divisions.

Physical Society, American, founded in 1899 for the advancement and diffusion of knowledge of physics. Mem-

bership: 5,000. President-elect: Dr. E. U. Condon. Secretary: Dr. K. K. Darrow. Headquarters: Columbia University, New York 27, N. Y. The annual meeting was in January, 1945, and three other meetings were held during the year.

Physicians, American College of, founded in 1915 as an organization of qualified specialists in Internal Medicine and allied specialties to maintain and advance the highest possible standards in medical education, medical practice and clinical research, to perpetuate the history and best traditions of medicine and medical ethics, and to maintain both the dignity and efficiency of Internal Medicine in its relation to public welfare. Membership: 4 Masters; 4,200 Fellows; 1,800 Associates; total (approx.), 5,500. President: Ernest E. Irons, M.D., Chicago, Ill.; President-Elect: David P. Barr, M.D., New York, N.Y.; Executive Secretary: E. R. Loveland. Headquarters: 4200 Pine Street, Philadelphia. With the conclusion of the war, the program of the college was extended to include awards of Research Fellowships and Clinical Fellowships, the latter especially designed to help its returning member veterans. Also it has a greatly expanded program of postgraduate and refresher courses, organized at medical centers in various parts of the country, and is embarked upon a project to aid its member veterans in their postwar reestablishment in teaching or practice. Other activities include investigation and certification of internists, publication of the *Annals of Internal Medicine*, resumption of its national Annual Sessions, award of the Phillips Memorial Medal for Achievement in Internal Medicine, etc.

Planned Parenthood Federation of America, Inc. (formerly Birth Control Federation of America, Inc.), formed in 1939, by the merger of the American Birth Control League (1921), and the Birth Control Clinical Research Bureau (1923), to foster Planned Parenthood by making birth control information available, under medical direction, through private physicians, hospital and public health clinics, and extra-mural clinics. Special emphasis is being given to medical service for returning members of the armed forces and their wives. Couples desiring advice on infertility are referred to physicians and clinics specializing in such service. Honorary Chairman: Margaret Sanger. President: The Reverend Cornelius P. Trowbridge. National Director: D. Kenneth Rose. Secretary: Mrs. Walter N. Rothschild. Headquarters: 501 Madison Avenue, New York 22, New York. For activities in 1945, see BIRTH CONTROL.

Planning and Civic Association, American, formed in 1935 by a merger of the American Civic Association (1904) and the National Conference on City Planning (1909). It promotes public understanding and support of planning for the best use of land, water, and other natural resources, higher ideals of civic life, and safeguarding of natural wonders, scenic possessions, and recreation facilities. Membership and Subscriptions: 2,000. President: Horace M. Albright. Executive Secretary: Harlean James. Headquarters: 901 Union Trust Building, Washington, D.C. The Association publishes a yearbook, *American Planning and Civic Annual*, and the quarterly, *Planning and Civic Comment*. Holds annually a Citizens Planning Conference, the 1946 Conference to be held in Dallas, Texas, April 22, 1946.

Polish Institute of Arts and Sciences in America, founded in 1942 to establish permanent collaboration between Polish and American scholars, and to assure for the duration of the war the continuity of Polish research work. Membership: 82 active members; 52 corresponding members. President of the Board: Hon. Jan Kucharszewski. Director of the Institute: Prof. Oskar Halecki. Headquarters: 39 East 35 Street, New York, N. Y. Publications: *Bulletin*, published quarterly; *Polish Institute Series* (F vol.). In 1944 the Midwest Branch was organized, with headquarters in Chicago where a first conference was held in 1942 and a second one in Poland: cultural reconstruction in 1945. The Institute has appointed delegates in several Latin American countries and cooperates with Polish research centers of all continents. Each of the five sections of the Institute (historical and political sciences, history of literature and of arts, law and social and economic sciences, pure and applied sciences, and educational problems) is organizing lectures of Polish and American scholars to be held at the headquarters of the Institute at least once a month. Special conferences on the history of East Central Europe, and on the role of the universities in the postwar world were organized in 1943, and a conference on the reconstruction of libraries in 1944. There also were conferences on the nutritional reconstruction of Poland, and on the history of the Polish immigration in the U.S.A. which led in October, 1944, to the foundation of the Polish-American Historical Commission, with a special publication, *Polish-American Studies*.

Polish National Alliance of the U.S. of N.A., a fraternal society founded in 1880. Membership: 800,000. President: I. K. Rozmarek. General Secretary: A. S. Szczerbowski. Headquarters: 1514-20 W. Division Street, Chicago. A convention is held once every four years, and the subsidiary lodges (about 2,000) meet monthly.

Political and Social Science, The American Academy of,

founded in 1889 to provide a forum for the discussion of the great political, social, and industrial problems confronting the world. Membership: 11,500. President: Dr. Ernest Minor Patterson. Secretary: Dr. J. P. Lichtenberger. Headquarters: 3457 Walnut Street, Philadelphia 4. A bi-monthly, *The Annals*, is published. The 1946 annual meeting is scheduled for Philadelphia, April 5-6.

Political Science Academy of, an international learned society founded in 1880, incorporated, 1910. Membership: 9,500. President: Lewis W. Douglas. Ethel Warner, Director. Editor of Publications: John A. Krout. Secretary: Noel T. Dowling. Headquarters, Fayerweather Hall, Columbia University, New York City. At the semi-annual meeting, April 4th and 5th, 1945, in New York City, World Organization—Economic, Political and Social, was the paramount issue discussed. At the annual meeting on November 8th, 1945, the topic considered was European Recovery.

Political Science Association, American, founded in 1903 to foster scholarly interest in the scientific study and improvement of politics and public law, administration, and diplomacy. Membership: 3,450. President: John M. Gaus. Secretary: Kenneth Colegrove. Headquarters: 1822 Sheridan Road, Northwestern University, Evanston, Ill. The Association maintains a Personnel Service indicating the records of young scholars available for appointment. The annual meeting of 1944 was cancelled. The 1945 annual meeting will be held March 28-30, 1946, in Philadelphia, Pennsylvania.

Prevention of Blindness, Inc., National Society for the, founded in 1915, concerned with the control and, where possible, the elimination of the causes of blindness, impaired vision, and eyestrain—not with activities on behalf of those already blind. Aspects of the program recently emphasized included development of eye health and safety practices in industry and the campaign for early detection and treatment of glaucoma. Members and Donors: 30,000. President: Mason H. Bigelow. Executive Director: Mrs. Eleanor Brown Merrill. Secretary: Miss Regina E. Schneider. Headquarters: 1790 Broadway, New York City 19.

Prevention of Cruelty to Animals, The American Society for the (A.S.P.C.A.), founded in 1866. President: Alexander S. Webb. Vice-President-Secretary: Richard Welling. Executive Vice-President: Sydney H. Coleman. Headquarters: 50 Madison Avenue, New York City. The Society maintains a shelter in each borough of New York City, in which it housed 211,147 animals in 1944. Its animal hospital at Avenue A and 24 Street, Manhattan, treats over 10,000 cases a year. An educational program is developed for the schools and for adults. The annual meeting was held Jan. 4, 1945.

Prison Association, American, founded in 1870 to improve laws, law enforcement, and penal and correctional institutions, to study the causes of crime, and to care for and provide employment for paroled and discharged prisoners and probationers. The Association maintains a free clearinghouse of information. Membership: 1000. General Secretary: E. R. Cass. Headquarters: 135 East 15 Street, New York City. The Annual Congress may be attended by anyone who wishes to profit thereby.

Protection of Foreign Born, American Committee for, founded in 1933 to promote better relations between native and foreign born by education, to combat discrimination on the ground of race, nationality, or noncitizenship, to encourage and facilitate naturalization; and to prevent the destruction of American families by deportation. It is not a membership organization, but has 400 annual contributors. Chairman: Hon. Stanley Nowak. Headquarters: 23 West 26th Street, New York 10.

Psychiatric Association, American, founded in 1844 to further the study of mental diseases, to further psychiatric hospitals, education, and research, and to apply psychiatric knowledge to other branches of medicine, to other associations and to public welfare. Membership: 3,659. President: Dr. Karl M. Bowman. Executive Assistant: Austin M. Davies. Headquarters: 9 Rockefeller Plaza, New York, N. Y. The 1946 meeting is scheduled for Chicago, May 27-30. See *PSYCHIATRY*.

Psychical Research, Inc., American Society for, incorporated in 1904 for the scientific investigation of all types of psychical phenomena. Membership: 500. President: Dr. George H. Hyslop. Secretary: Mrs. E. W. Allison. Headquarters: 40 East 84 Street, New York City 16.

Psychological Association, American, founded in 1892 to advance psychology as a science. Membership: 4,500. President: Henry E. Garrett. Executive Secretary: Dael Wolfe. Headquarters: 2101 Constitution Ave., Washington, D. C.

Public Administration, Institute of, founded in 1906 as The Bureau of Municipal Research. The Institute's purpose is to improve the management and operation of American government through the scientific study of public administration, the development of practical ideas and improved procedures in government administration, dissemination of the results of such research to public officials and to citizens generally, and the advancement of training for the public service. Membership: 12. Chairman: Richard S. Childs. Director: Luther Gulick. Headquarters: 684 Park Avenue, New York 21, N.Y.

Public Affairs, Institute of, founded in 1927 to examine and publicize by formal addresses and open-forum discussions important national and international problems. Public sessions from one to two weeks, usually in July. Membership and attendance 3,000 yearly; 39,000 total. Acting Director: Oron James Hale. Secretary: Mary H. Spalding. Headquarters: University of Virginia, Charlottesville, Virginia. Emphasizes student participation through representatives of principal Eastern and Southern colleges. The program of the last (1942) session was built around the theme, "New Strategies for War and Peace." The Institute was suspended for the duration of the war.

Public Affairs Committee, Inc., founded in 1936 to make available in summary and inexpensive form the results of research on economic and social problems to aid in the understanding and development of American policy. Chairman: Ordway Tead. Secretary: S. M. Keeny. Headquarters: 30 Rockefeller Plaza, New York City 20. In their tenth million, there are more than 64 current *Public Affairs Pamphlet* titles.

Public Health Association, American, founded in 1872 to promote and protect public and personal health. Membership: 9,800. President: Dr. John J. Sippl. Executive Secretary: Dr. Reginald M. Atwater. Headquarters: 1790 Broadway, New York, N.Y. During 1945 the Association through its project on Merit Systems rendered service to twenty-two states and two cities in supplying examinations for public health nurses, health officers, laboratory workers, sanitarians, nutritionists, and medical social workers. It distributed its reports on Standard Methods for the Examination of Water and Sewage, and of Dairy Products, Diagnostic Procedures and Reagents, Swimming Pools and Other Bathing Places, Communicable Disease Control, Occupational Lead Exposure and Lead Poisoning, Bacteriological Examination of Shellfish and Shellfish Waters, and on professional qualifications of several types of public health workers. It began a program of accrediting schools of public health beginning with those offering the Master of Public Health degree. Its Committee on the Hygiene of Housing published an appraisal form representing a new technique for selecting those houses which should be replaced for health reasons. Four active subcommittees were at work on positive standards for postwar housing. The Committee on Administrative Practice conducted studies of State health administration, advanced its investigations on public medical care as a responsibility of health departments and published its recommendations with regard to providing minimum essential health services to the entire population through full time local health units serving populations of 50,000. The Committee compiled and published a range of indices of health experiences and practices for a group of 243 communities. The official publication of the American Public Health Association is the *American Journal of Public Health*, now in its 85th volume.

Radio Relay League, Inc., American, a non-commercial association of radio amateurs, founded in May, 1914, and bonded for the promotion of interest in amateur radio communication and experimentation. Membership: 36,725. President: George W. Bailey. Headquarters: West Hartford, Connecticut. Official Organ: *QST*. Publishers of the *Radio Amateur's Handbook* and other radio training aids. Activities of the League in 1945 included additional preparation of radio amateurs for participation in the war effort, further promotion of the War Emergency Radio Service for civilian defense, cooperation with the Federal Communications Commission in the revision of amateur radio regulations for postwar operation, and the institution of a rigorous technical program to adapt war-born radio techniques to amateur communications practice.

Railroads, Association of American, founded in 1934, to deal with matters of common concern in railway operations, maintenance, engineering, research, traffic, accounting, finance, valuation, taxation, law, legislation, transportation economics, and public relations. Membership: 195 railroads in United States, 5 in Canada, 6 in Mexico, and 173 associate members. President: J. J. Peley. Secretary-Treasurer: H. J. Forster. Headquarters: Transportation Building, Washington 6, D. C. See *RAILWAYS*.

Recreation Association, National, founded in 1906 with the following objectives: That every child in America shall have a chance to play; that everybody in America, young or old, shall have an opportunity to find the best and most satisfying use of leisure time. Membership: 11,000. President: Howard Braucher. Headquarters: 815 Fourth Avenue, New York City.

Refugee Service, Inc., National, founded in 1939 to provide complete program of rehabilitation and social adjustment for the 250,000 refugees of all nationalities and creeds in the United States. Membership: 250. President: Charles A. Riegelman. Executive Director: Joseph E. Beck. Headquarters: 105 Nassau Street, New York 7, N. Y. Service in 1945 included: average monthly case load of 2,400; 83,688 migration services; servicing 17,408 requests for location of displaced persons abroad; 3,934 completed locations; placement of 80 doctors and

dentists; 410 job placements. The annual meeting was held Jan. 21, 1946.

Relief for France, American, established 1944 as a unified organization comprising societies throughout the United States which have been engaged in French relief, with representation of international organizations whose programs include aid to French people. It sends food, clothing, pharmaceutical products, emergency supplies, ambulances, to France; supports hospitals, rest homes, welfare and child-feeding centers in France; solicits gifts in-kind of food, clothing, etc., as well as money; is also central registry for child "adoptions" by individuals or groups in the U.S.A. wishing to send packages directly to individuals in France.

Executive Vice-President and Treasurer: Elliott H. Lee. Vice-Presidents: Anne Morgan, Marian A. Dougherty, André Meyer, Howard Sturges. Secretary: W. A. Roseborough. Headquarters, 457 Madison Ave., N.Y.

Relief for Holland, Inc., American, formerly Queen Wilhelmina Fund, Inc., founded in May, 1940 to provide relief for the people of and refugees from The Netherlands and The Netherlands East Indies. A member agency of the National War Fund. Over 200 chapters across the country collect food, used clothing, household equipment, and other needed supplies for shipment to Holland and the East Indies. Sewing and knitting chapters also make new garments from materials purchased with monies provided by the National War Fund. Purchases of emergency food supplies also are made and shipped abroad. During first 9 months operation following liberation of the southern portion of Holland over 7,500,000 lbs. of food, clothing, and other badly needed materials were sent through national headquarters in New York. Headquarters: 465 Fifth Ave., New York 17. Public Relations Office: 670 Fifth Ave., New York 19.
